It is surely not any sort of artistic or literary value that accounts for the widespread and enduring popularity of wisdom literature. *Dicts and Sayings* tends to be dull and repetitive, as are most of the wisdom texts that originated in the Middle East. Consider also the ninth- or tenth-century *Secret of Secrets* (*Sirr al-asrâr*), spuriously attributed to Aristotle. The text purports to be the philosopher's letter of advice to his former pupil Alexander the Great, and while this seems at first to be an interesting narrative conceit, it soon becomes apparent that behind this thin veneer is little more than a list of didactic precepts. The reader is meant to follow Alexander's example and dutifully receive the author's wisdom. *Dicts and Sayings* has much the same agenda: encouraging the reader to accept and internalize the various teachings, which are all the more compelling because they are ascribed to the likes of Hippocrates, Plato, and the other eminent philosophers. Since most of the proverbs are about how people should live their lives, wisdom literature can thus be seen as an instrument of social control.

Christian and Islamic Histories of the Crusades

Crusade sources were written for particular audiences and must be interpreted in the context of where, when, and in whose interest they were composed. Their diversity is demonstrated in that they were authored over nearly two centuries by Christians, Muslims, and Jews writing in languages that included Latin, Old French, Arabic, Greek, Armenian, and Hebrew. The sources comprise personal letters, ecclesiastical documents, charters, financial records, biographies, and histories of specific crusades and the crusading movement. Unlike most other crusade sources, the biographies and histories offer sweeping narratives that provide a sense of human drama.

Christian Histories of the Crusades

The events of the First Crusade (1096–1099) and its aftermath are the subject of the earliest Christian histories of the movement. The accounts of three participants—an anonymous Norman warrior who composed the *Gesta Francorum* (*The Deeds of the Franks*), Fulcher of Chartres who authored the *Historia Hierosolymitana* (*The Jerusalem History*), and Raymond of Aguilers who crafted the *Historia Francorum* (*The History of the Franks*)—inspired many early-twelfth-century Latin Christians to take up their pens in an effort to write more thorough and interpretive histories of the crusade. The works of Robert the Monk, Albert of Aix, Raoul of Caen, Baldric of Dol, and Guibert of Nogent are among the later histories, which were in varying degrees based on eyewitness accounts of the First Crusade.

Such works were often written several years, or even decades, after the events they describe.

The earliest and most influential eyewitness account of the First Crusade was the *Gesta Francorum*, which is believed to have been written around 1100 and was a major source for the construction of later histories. Among those later histories was Guibert of Nogent's *Dei Gesta per francos* (*The Deeds of God Performed by the Franks*). Guibert provided a history of the First Crusade that was recorded within ten years of the expedition and framed events relating to the crusade in the context of providential history. In doing so, Guibert compared the efforts of the crusaders with those of the armies of the Hebrew Scriptures that were often called to fight on God's behalf. While he relied heavily on the *Gesta Francorum* for much of his account, Guibert likely was in attendance at the Council of Clermont in 1095 and would have been familiar with the general enthusiasm aroused by Pope Urban II's speech.

The most important primary source for the Second Crusade (1147–1149) was Odo of Deuil's *De profectione Ludovici VII in orientem* (*The Journey of Louis VII to the East*). Unlike the glowing histories of the successful First Crusade, Odo's work served to defend the actions of Louis VII during the failed Second Crusade by emphasizing the unforeseen misfortune that befell his king. Among the most valuable of all Christian histories of the crusades is the work authored by William, archbishop of Tyre (r. 1175–1185/1186), who was born in the Holy Land around 1130 and was among its most prominent residents. William's only extant work, the *Jerusalem History*, which is commonly known as the *History of Deeds Done beyond the Sea*, is a detailed account of the crusading movement and the kingdom of Jerusalem from its inception to 1184. Although William used works by Fulcher of Chartres and others, his work is valuable as a primary source for his personal insights concerning the crusader states and Holy Land in the twelfth century. The popularity of William's work is demonstrated by its use as a source in the construction of the thirteenth-century chronicles of James of Vitry and Matthew Paris. A translation into Old French, known as *L'Estoire de Eracles empereur* (*The History of Emperor Heraclius*), was well circu-

➤ CHRISTIAN REACTIONS TO THE CRUSADER CAPTURE OF JERUSALEM, 15 JULY 1099, FROM THE *GESTA FRANCORUM* (CA. 1100)

"Soon our men were running all around the city [Jerusalem], seizing gold and silver, horses and mules, and houses filled with all kinds of goods. Rejoicing and weeping for joy, our people came to the sepulcher of Jesus our Savior to worship and pay their debt [fulfill their crusading vow]. At dawn our men cautiously went up to the roof of the Temple and attacked the Saracen men and women, beheading them with naked swords. Some of the Saracens, however, leaped from the Temple roof. . . . Our men then took council and decided that everyone should pray and give alms so that God might choose for them whomever he pleased to rule over the others and govern the city."

Histoire anonyme de la première croisade [*Gesta Francorum et Aliorum Hierosolymitanorum*], trans. and ed. Louis Brehier (Paris: H. Champion, 1924), 38–39. Trans. James Brundage, *The Crusades: A Documentary History* (Milwaukee, WI: Marquette University Press, 1962), 64–65.

lated and had many anonymous additions made to it in the thirteenth century.

Among the important thirteenth-century Christian histories of the crusades are two in Old French by Geoffrey de Villehardouin and Jean de Joinville, both high-ranking lords. Villehardouin participated in the controversial capture of Constantinople during the Fourth Crusade (1202–1204). His account of the expedition argues that the crusaders' actions were the result of a number of unforeseen events that left them with no choice. Joinville recorded the events of the failed crusades of his friend, the monarch Louis IX. Joinville's account is similar to that of Odo of Deuil in that he cast the efforts of his king in the best possible light.

Islamic Histories of the Crusades

The scholar Ibn al-Qalanisi was the first Arab chronicler to produce a lengthy history of the

➤ MUSLIM REACTIONS TO SALADIN'S CAPTURE OF JERUSALEM, OCTOBER 2, 1187, FROM IMAD AD-DIN (CA. LATE TWELFTH CENTURY)

"Sweet was it for him [Saladin] to be victorious [at Jerusalem]; his throne seemed as if surrounded by a lunar halo. Qur'anic reciters sat there reciting and admonishing in the orthodox tradition. Poets stood up to declaim and to demand, banners advanced to be displayed, pens scribbled to spread the joyful news, eyes wept with great joy, hearts felt too small to contain their joy at the victory, tongues humbled themselves in invocations to God. . . . Thus with my quills I gave good news to the four quarters of the earth, and with the prodigies of my pen I expressed the marvels of memorable events; I filled the towers with stars and the caskets with pearls. This joyful news spread far and wide . . . it was welcomed with enthusiasm and its sweetness surpassed candied fruits and sugar. The world of Islam was ready and adorned for a festival to celebrate the fall of Jerusalem. Her merits were illustrated and described and the duty to visit her explained and specified to everyone."

Imad ad-Din al-Isfahani, *al-Fath al-qussi fi l-fath al-qudsi* [Ciceronian Eloquence on the Conquest of the Holy City], trans. Francesco Gabrieli, *Arab Historians of the Crusades*, trans. E. J. Costello (Berkeley and Los Angeles: University of California Press, 1969), 160–161.

crusades covering a period from the First Crusade until his death in 1160. His work, commonly known as the *Damascus Chronicle*, is one of the main primary sources for nearly all later Arab historians of the crusades. The work traces the hardening of Muslim feeling against the crusaders and the unification of Islam during the twelfth century. Ibn al-Athir is among the most important Arab historians of the later crusades due to the scope of his massive history of the Muslim world, commonly translated as *The Perfect History*. The work contains the author's extensive eyewitness accounts of the career of Saladin and ends with the death of the author in 1233.

Other important Islamic historians of the crusades include Baha ad-Din and Imad ad-Din. Like

Ibn al-Athir, both authors devote much of their attention to Saladin's reign (1174–1193). This is unsurprising in that it was during this period that the Islamic world experienced its greatest initial successes against the crusaders. Baha ad-Din, as a member of Saladin's household, was uniquely positioned to author a biographical account of the life of Saladin. His portrayal of Saladin is of a deeply religious and just ruler with a passion for expelling the crusaders from the Holy Land. Interestingly, Baha ad-Din also writes positively of the character and spirit of Richard the Lionheart, which seems misplaced in light of his otherwise scathing critique of the crusaders. Imad ad-Din, as a secretary to Saladin, was equally well positioned to record the deeds of his leader and argued that Saladin's successes signaled the beginning of a new era for Islam.

The Religious Framework of the Histories

While examining crusade sources, the reader should keep in mind the deeply religious nature of the conflict. Religious sentiment and considerations dominated the interpretive framework of nearly all authors of crusade histories. Both Christian and Islamic writers argued that their armies fought with divine sanction. The earliest Christian chroniclers presented the crusaders' efforts as essentially acts of charity. Those who were pure of heart and willing to take crusading vows would reap spiritual benefits for going to the aid of Eastern Christians and holy places suffering under the yoke of Turkish oppression. In addition, they were just wars in the tradition articulated by Saint Augustine in the fifth century. In other words, they were defensive wars fought against unjust, as well as unholy, invaders of sacred lands that rightly belonged to Christendom. Muslim historians in turn presented the crusades as an invasion of their sacred homeland and assured potential warriors of the glory and spiritual benefits they would receive for their fight against the infidel. In the wake of victory, crusade-era chroniclers, whether Christian or Muslim, gave thanks to God for their success. Following sometimes humiliating defeats the same chroniclers, who had previously argued that God supported their efforts, had to explain the con-

tradition of failure. Christian and Muslim chroniclers alike usually attributed such losses to the sinful conduct of the losing armies, either before or during the battle, or the sins of the people who supported them, which in turn caused God's displeasure and His allowing them to suffer defeat for the purgation of their sins.

From Epic to Romance to the Nitty-Gritty

Literature often reflects, while at the same time interprets, the conditions of a culture. The poets of Western Europe's High and Late Middle Ages (ca. 1000–1500) produced works that uniquely reflected the social ideals of the medieval Latin West. Their themes ranged from crusading knights to romantic interludes between lovers and from the humorous and ironic to penetrating images of death and suffering.

The poets (and prose writers) of this period of European history, which was far from being a “Dark Age,” created some of the most important literary works of Western civilization. In fact, medieval Latin literature far exceeded in quantity the body of classical Latin literature preserved from Roman antiquity. Medieval European literature also includes an extensive collection of vernacular works in such languages as French, Italian, Spanish, English, German, and Icelandic, which became increasingly pronounced after 1100.

In the early twelfth century vernacular literature was primarily epic. In particular, French *chansons de geste* (songs of heroic deeds) were the most popular style. As the term suggests, these were sung narrative poems performed by jongleurs (itinerant musicians) describing the “high deeds” and “heroic exploits” of Christian

A young Roland, with attendants. Illustrated page of French text showing a young man attended by servants, a crowned figure, and a bishop, possibly from the twelfth-century *Chanson de Roland*. (HIP/Art Resource, NY)

heroes. Numerous factors suggest that these epics were the product of a long oral tradition that appeared in written form in the twelfth century. Regardless of their origin, which is still an ongoing debate, it is incontrovertible that the twelfth century was the period when epic became prominent in the medieval West.

Medieval Latin literature, which tended to be formulaic, heavily influenced the vernacular epics, giving them likewise a formulaic typology. In other words, the epics shared standard themes and standardized ways of describing places, characters, and their behavior. This certainly was the case with the *chansons*.

Most authors of the *chansons de geste* situated their stories in an idealized (and anachronistic) Carolingian period (ca. 750–850). Many of the stories concern battles between the forces of Islam and Christianity, and more than half describe the exploits of the Carolingian king and emperor Charlemagne (r. 768–814). Although Charlemagne was often (wrongfully) claimed by the twelfth-century French as an early French king and emperor, the *chansons de geste* were not confined to a French audience. In fact, the style and themes were quickly adapted and became very popular in Spain, Germany, Italy, and Scandinavia. The *chansons* emphasize great

➤ A STUDY IN CONTRASTS—CHRÉTIEN DE TROYES AND FRANÇOIS VILLON

The works and lives of Chrétien de Troyes and François Villon illustrate the shift in European literature that took place between the late twelfth and mid-fifteenth centuries.

Chrétien (ca. 1140–before 1200) was the first great poet of courtly romance. He was a university graduate and a member of the court of Countess Marie de Champagne. His topics centered on the knights of the Round Table and often focused on the psychology of love. His characters and their relationships were quite complex. He helped develop the concept of courtly love, particularly in the romance *Lancelot*. This love was rarely identified with marriage but instead usually involved a young knight and a woman married to an aristocrat. His stories also often included adventurous journeys by brave knights that were often metaphors for individual spiritual quests. Chrétien's portrait of a highly idealized world of courtly love, honor, and chivalry appealed almost exclusively to the aristocratic patrons for whom he wrote and whose values he helped shape.

On the contrary, François Villon (1431–after 1463) spent more time with outlaws and revolutionary groups than with the nobility. He was a University of Paris graduate but also a career thief and bandit. Villon was arrested countless times, spent time in prison, was responsible for the deaths of at least two men, and was twice banished from the city of Paris. Like Chrétien, his poetry was widely popular during and after his lifetime, but it was not limited to an aristocratic audience. It went through a number of printings and is largely credited for helping form the foundation of modern French poetry. Perhaps it was his vagabond life that helped stimulate Villon to write poetry that ranged from humorous and ironic caricatures of the rich to passionate and sincere descriptions of death and poverty, such as in one of his most famous works, *The Testament*. At the age of 34 he wrote his last work, *The Ballad of the Hanged*, while awaiting a sentence of death in Paris. The poem is Villon's last testament about the injustice of the world in which he lived. However, he escaped the noose by virtue of a last-minute appeal, which reduced his sentence to banishment from the city. He was never heard from again.

—Jace Stuckey

deeds, courage in battle, loyalty, duty, and religious faith. The oldest complete and most well known of these works is the *Chanson de Roland* (*Song of Roland*), which describes the attack on the rear guard of Charlemagne's army while on its way back to France after a seven-year campaign in Spain. The story's namesake, Roland, is Charlemagne's nephew and commander of the rear guard. Once attacked by the Muslim army, Roland is too prideful to call for help until it is too late. He fights bravely but loses all of his men and eventually his own life in the battle. Charlemagne takes revenge and destroys the Muslim army.

Roland is an ideal example of the *chanson* because it is one of the earliest. Its oldest extant manuscript dates to the mid-twelfth century, but it undoubtedly was already in circulation as an oral epic around 1100. Arguably, all subsequent poems owe something to it. Although highly emotional in places, in these stories deeds are more important than inner feelings and motives. Moreover, their themes are not complex. The poet's concern with characterization is minimal, and women usually have little place in most of these twelfth-century epics.

The epics reflect the emerging knightly ideals that helped to define the early crusading age of the twelfth century. The cause of crusading and defense of Christendom were the primary focus. The literature of this period represents a culture that found its ethos and role models in the lives of kings and conquerors from an idealized past. The crusading theme incorporated into the genres of the period served as propaganda for a culture that embraced emerging chivalric values.

There were also numerous works of the *chanson de geste* genre that explored the inherent tension in the relationship between the nobility and royalty. These complex and problematic feudal relationships were the primary theme of the rebellious-baron cycle of the chansons and celebrated the exploits of local barons rather than the king.

However, the chivalric image created by the heroic epics would quickly be expanded upon by the emerging romance works beginning with Chrétien de Troyes in the late twelfth century. The romance broke from some of the formulaic

restrictions of the epic and introduced aristocratic readers and listeners to the three major cycles of stories: the Matter of Rome (hence “romances”), which actually centered on Alexander the Great; the Matter of Britain, which were the stories and legends of King Arthur, Tristan, and the knights of Celtic lore and courtly love; and the Matter of France, the tried-and-true story tradition revolving around Charlemagne. Although romance would not prevail until the thirteenth and fourteenth centuries, there were clearly signs that worldviews and literary tastes were changing. With the rise of romance, there was an increased interest in the individual and in personality and the complexity of human and romantic love. Characters were more multifaceted, and the stories appealed to a more literate audience that often preferred to read them privately rather than hear them publicly. Women became important characters. The poet often focused on individual relationships and individual exploits, and less focus was given to major events. The story was often more about an individual journey or a spiritual quest rather than a great battle. This also marked the beginning of a move away from strictly religious themes and toward more secular interests, such as love between a woman and a man.

Epic poetry and literature continued to be produced during the thirteenth and fourteenth centuries but now with a significant influence from the romance movement. In addition, there was a profusion of comic and satirical elements that also changed the tenor of the themes and the way audiences and readers viewed the works.

Romance, too, would be transformed by the changing social and cultural norms of Europe's late medieval world. In the fourteenth and fifteenth centuries the works of Geoffrey Chaucer, Christine de Pizan, and François Villon moved far beyond the idealized themes explored in epics and romances by introducing social and political commentaries that had bite. In addition, the humanist movement with its emphasis on antiquity led to the production of classically inspired histories, especially in Italy.

Oral and Written Sources for the Mongol Empire

The study of the Mongol empire tends to be somewhat problematic due to the number of languages required and the origins of the sources. Indeed, *The Secret History of the Mongols* is one of the very few documents concerning the Mongols from the Mongol point of view. Although it is said that the victors write history, in the case of the Mongols, more often than not, the defeated and conquered populations wrote it. Most of the primary sources on the Mongols were written by Persians, Chinese, Russians, Arabs, Armenians, Western Europeans, and others. While some of the documents were written by people employed by the Mongols, their history was almost always written from the viewpoint of an outsider.

Due to this, the *Secret History* remains one of the most important sources for the study of the Mongol empire. Although it only goes up to the reign of Ogoidei (r. 1229–1241), it tells the reader much about the Mongols. While it is an important historical source, it is also in the form of epic literature, often blending history with myth, particularly concerning the origins of the Mongols. Indeed, much of it was written years after the events it narrates, as the Mongols did not have a written language until around 1204. Prior to this, their own history was contained in an oral tradition.

The title of the *Secret History* comes from the idea that it was something meant only for the eyes of the Mongols. While this is true, the book did not simply glorify the Mongol rulers. Instead it gives an intimate portrayal of Chinggis Khan from his youth to his rise as ruler of a vast empire and does not attempt to conceal embarrassing facts or weaknesses. From the *Secret History* we learn that Chinggis Khan killed his half brother, was afraid of dogs, and fled when his wife was kidnapped during an attack on his camp.

➤ EXTRACT FROM *THE SECRET HISTORY OF THE MONGOLS*

Here we read how Temujin (Temüjin), later known as Chinggis Khan, killed his elder half-brother Bekter. At the time, their father Yisugei was dead, and they had been abandoned by their tribe. Their family attempted to live off of the land, hunting birds and fishing. The scene takes place after Bekter stole food from Temujin and his younger brother Qasar.

“At that time Bekter was sitting on a hillock, guarding their nine horses, the light-bay geldings. Temüjin, hiding from behind, and Qasar, hiding in front, were approaching and about to draw out their arrows when Bekter saw them and said ‘Just when we cannot put up with the outrage of our Tayici’ut kinsmen and ask ourselves who shall be able to take vengeance on them, why do you regard me as a lash in the eye, a thorn in the mouth? When

We have no friend but our shadow,

We have no whip but our horse’s tail,

How can you harbour such thoughts towards me? Anyway, do not destroy my hearth, pray do not make away with Belgütei!’ So he said, and sat cross-legged, waiting for their arrows. Temüjin and Qasar, one from the front and one from the rear, shot at him at close range and went away.”

Source

Igor de Rachewiltz, *The Secret History of the Mongols: A Mongolian Epic Chronicle of the Thirteenth Century* (Leiden and Boston: Brill, 2006), sec. 77.

Another characteristic of the *Secret History* that adds to its value as a source is that it provides insight into the Mongol mind. Because it was written for Mongols, many things are omitted or just barely referred to, as a Mongol would automatically understand certain statements or comprehend what was implied. To the modern reader it can be somewhat difficult to understand, with many deeper meanings overlooked in often simple statements. Yet it is a rich source of information particularly on the early stages of the Mongol empire.

Other Mongol sources existed at some point and found their way into Chinese and Persian accounts. These help in filling the gaps and verifying information from *The Secret History*. One such source was the *Altan Debter*, or *Golden Book*. This was an official court record that is now lost. Non-Mongols were not allowed to view it, much like *The Secret History*. However, material from it and other sources appeared in Rashid al-Din’s (1247–1317) *Jamiat al-Tawarikh*, or *Compendium of Chronicles*. Although he was commissioned to write it by the Mongol court of Persia, he did not have access to the *Altan Debter*. However, he was given information from it by Bolad, a high-ranking Mongol who had served Khubilai Khan (r. 1260–1294). Bolad arrived in Persia in 1285 as an ambassador and then served in a variety of positions until his death in 1313.

Similar material also appears in the Chinese chronicle known as the *Shengwu Qinzhen Lu*, or the *Record of the Personal Campaigns of the Sagely Warrior*. This covers the campaigns of Chinggis Khan and closely corresponds to the *Secret History*. The idiom is clearly Mongolian and appears to be a translation or adaptation of a Mongol source, possibly the *Altan Debter*.

Other sources may also include elements from either the lost *Altan Debter* or from oral tradition. Unfortunately, scholars may never be able to determine exactly what information came from the Mongols and what was observed by the author of each work.

Literature in Pre-Columbian Mesoamerica

The vast literary and theatrical heritage of the peoples of Mesoamerica was preserved and passed down to later generations by two major

means: oral tradition and picture writing. Performers memorized and reproduced extremely long texts, while pictography served as a major mnemonic device and tool of learning, conveying in authoritative and durable form stories that often conveyed important historical, political, and ideological information.

Given that Mesoamerican literature was basically oral (as was true for all other Native American societies), its stylistic features were tied to modes of enunciation. Performance was the major means of a text's circulation, in contrast to the modern practice that focuses on silent and private reading. The most common stylistic device was the couplet, a pair of parallel verses that were repeated with only slight wording variations. In this manner, abstract concepts were expressed by juxtaposing concrete terms in subsequent verses. For example, the term for poetry was expressed with the phrasing "flower-and-song," authority was defined as "seat-and-mat," and war was metaphorically expressed as "fire-and-water." The same technique of coupling concrete terms to express an abstract concept is also found in pictographic forms where political or religious leaders frequently are depicted with flowery scrolls coming out of their mouths, signifying their ability to produce good speeches; ruling dignitaries and marital alliances are usually depicted as couples seated on reed mats; and the outbreak of an armed conflict is similarly represented with the clashing of water and fire.

Mesoamerican literature included different genres, among which moral speeches, historical accounts, lyric poetry, and sacred hymns were the most common. Most of our knowledge of these traditions comes from the time of the Spanish Conquest, when friars began to transcribe in Latin script the vast Nahua lore (the Nahuas being speakers of Nahuatl, the indigenous language of central Mexico). Friars also took over the education of Aztec nobility, thereby creating an educated indigenous class of people who soon began to write about their own culture using the Latin alphabet. The pre-Columbian tradition of pictography, however, was by no means discontinued, and a large body of painted documents of religious, historical, and economic subject matter also exists from the ensuing period.

➤ MEXICA HISTORIES

The Mexica, or Aztecs, form part of the larger ethnic group known as the Nahuas, who inhabited central Mexico. According to their own accounts, they originated in the northern desert region of modern Mexico from an ancestral place called Aztlan (from which the word "Aztec" originates). The journey is related in several slightly different versions, all of which equally entail a cultural and geographic shift of epic proportions. Although no document has survived from the pre-Columbian period, several postconquest maps and pictographic historical accounts tell the epic story of a wandering group of hunters and warriors who decided to leave the northern desert. The leaders were guided by the Mexica patron deity Huitzilopochtli. In the thirteenth century they entered the Basin of Mexico, where ancient civilizations had developed agriculture, large cities, and a sophisticated culture for over two millennia, forms of lifestyle, language, religion, and subsistence that the Mexica soon embraced.

The story of the Mexica migration is ultimately a tale of how a group of newcomers was able to settle, propose, and create a center of preeminent power (based on their city of Tenochtitlan, founded on a lake) by adopting and claiming the heritage of other great ancient civilizations, such as those of Teotihuacan and the Toltecs.

—Alessia Frassani

Political leaders gave moral speeches on special occasions, such as accession ceremonies. In ancient Mesoamerica as well as in modern Native American traditions, great emphasis was placed on the oratorical skills of political leaders. Known as *buehuetlatolli* in Nahuatl, which means "ancient speech," this phrase can also be understood as the "knowledge of the elders." These speeches were meant to give guidance and rules of conduct to the younger generations. Many were collected by the Franciscan friar Bernardino de Sahagún in the sixth book of the so-called *Florentine Codex*, a sixteenth-century encyclopedia of Nahua culture.

Historical accounts combined genealogical reckoning with epic accounts of the deeds of cultural heroes. This was particularly the case of the Mixtecs in southwestern Mexico, whose

pictographic manuscripts are the only ones that have survived from the pre-Hispanic period. The legitimation of dynastic rule was cast into a large epic lore, part of the common heritage of the Mixtecs. Despite this mythohistorical background, the historical accuracy of the dates (expressed according to the ancient Mesoamerican calendar) and geographical places is undisputed.

Lyric poetry was an important aspect of Mesoamerican court literature. In contrast to the grand narratives of epic history, these poems, most notably those by Nezahualcoyotl, ruler of the city of Tezcoco in the Basin of Mexico, express an intimate view of Mesoamerican courtly life. They focus on love, friendship, the frailty of life, and the mystery of death and the divine. Finally, sacred hymns were chanted during religious ceremonies and centered on specific deities. Depending on the month, the gods of rain, maize, war, and so on were summoned for their powers or thanked for their intercession. Most of the time, priests acted as impersonators of the deity invoked.

Theater among the Incas

The absence of alphabetic writing among the Incas and the targeted eradication of Inca culture by Spanish authorities have made it difficult to reconstruct the world of Inca theater with any precision. Most of what we know about the theater of the Incas before contact with Europeans comes from early chroniclers who described Inca practices before colonial incursions had significant influences on them. Because the chroniclers were trying to understand and record what they saw according to their own European frame of reference, however, they tended to describe unique indigenous practices in European terms.

For example, chroniclers describe the indigenous forms *wanka* and *aránway* as tragedy and comedy, even though they do not correspond neatly with those categories. Instead, the *wanka* was a ritual representation of military deeds and victories by great leaders of the past, sharing with the European genres of tragedy and historical plays the depiction of exploits of noble figures. The *aránway* enacted scenes from agricultural and domestic life, analogous to the material of some European comedic forms. Both forms incorporated music, song, and sometimes dance in their enactment.

In addition to these forms that appear to have been most similar to European theater, Inca ritual performance tradition included the *wawaki*, a song sung back and forth in dialogue at certain festivals; the *taki*, a form of communal music celebration involving instrumentation and sung verse; and the *wayñu*, a form of poetry, song, music, and dance. Some of the Inca-influenced colonial dramas included these genres within them, employing a chorus that participates in the dialogue, like many plays of ancient Greece.

The more theatrical of these pre-Conquest spectacles, or public rituals, were enacted in an open space called an *aranwa*, at the center of which was the *mallki*, a small collection of trees or bushes that served as a type of scenery. The participants gathered around the *mallki* and remained there until the representation or performance ended. The nonparticipants, much like a

modern-day audience in a circular theater, gathered in a circle around the actors at a distance from the mallki.

Beyond these forms of ritual performance, one chronicler, Juan de Santa Cruz Pachacuti Yamqui, describes what seem to be specific dramatic pieces, including a “joyous representation,” “a farce,” and “a tragedy,” although these could also refer in the original Quechua to roles that participants might play in the ritual performances. Regardless of whether these refer to specific performances or ritual roles, Quechua has significant theatrical terms such as *yachapayay*, which means to imitate or represent; *puqlay*, which means to play; *yachachikuy*, which means to rehearse; and *pampakuy saynatakuy*, which means to put on a mask. All of these support the presence of an established dramatic tradition before European contact.

Regarding authorship, according to multiple chroniclers, *amautas*, who were the learned men of the Inca empire, served as philosophers, historians, poets, and teachers of the nobility. In these roles, they were charged with remembering the great deeds and figures of Inca history, therein producing an oral literature, some of which was performed, that served to bolster the values of the Inca ruling class. Of course, these early dramaturges remain anonymous.

While no authoritative pre-Columbian texts of Inca dramas have been preserved, there are two specific texts worth mentioning. Bartolomé Arzáns de Orsúa y Vela describes in his *Historia de la Villa Imperial de Potosí*, written between 1702 and 1735, dramatic representations that took place in 1555. The precise source of his description of the events of 1555 in Potosí has yet to be found, but his text describes four dramas dealing with the origin of the Inca monarchs, the triumphs of Huayna Capac, the tragedy of Cusi Huascar, and the death of the Inca Atahualpa. The second significant text, *Ollantay*, a play composed in Quechua containing indigenous material and Spanish forms, can be traced to a manuscript

➤ OLLANTAY

Ollantay presents the story of a high-level official in the Inca empire, Ollantay, who is not of the Inca royal class but falls in love with Cusi Coyllur, the daughter of the Inca Pachacutec (also known as Pachacuti, ca. 1438–1471). His request to marry Cusi Coyllur is denied, so Ollantay rebels. At the beginning of the ten-year-long rebellion, Cusi Coyllur is confined to a monastery-like home where she gives birth to a daughter. After meeting initial successes, Ollantay is subsequently defeated and captured by the general of the new Inca Tupac Yupanqui (ca. 1471–1493). Instead of executing him, the Inca pardons Ollantay and reunites him with Cusi Coyllur and their daughter.

This play was reputed to have been performed in front of Tupac Amaru II, the leader of an indigenous rebellion in the 1780s that culminated a century of violent social conflict and resurgent indigenous nationalism. Given this socio-historical setting, many scholars view the performance tradition of *Ollantay* in connection with a desire to reconstruct and glorify the indigenous past in the eighteenth century, while others see *Ollantay* as essentially a pre-Columbian work that was merely written down after the conquest but has retained its uniquely indigenous character. Its depiction of Inca life, culture, and history, its Quechua prose and poetry, and its predominantly Spanish Golden Age dramatic form suggest that it is a hybrid text that incorporates traditional indigenous dramatic material into a Europeanized form.

—Luke Goble

brought to light in 1853, though some scholars argue for its pre-Columbian origin.

A World on the Move—The Growing Interconnectedness of Peoples

An intensified movement of individuals and peoples took place on both “world islands,” Afro-Eurasia and the Americas, between 1000 and 1500, and this activity, which sprang from a host of motives and took many forms, served to bring large numbers of peoples into closer contact with one another, for better and worse. Much of that travel was for peaceful purposes, as pilgrims, merchants, missionaries, diplomats, and adventurers trekked along caravan routes in the safe company of many companions, pursued more dangerous solitary pathways on foot or on the backs of animals of burden, traveled through inland waterways, or plied the numerous sea-lanes that washed along all hemispheres and through all seas and oceans. Some travelers were less peaceful, as invading armies, seaborne pirates, and land-based bandits traveled along these same routes and roads carving out states, establishing border outposts in distant lands, raiding neighboring lands, and, on a less macroscopic level, preying on vulnerable travelers wherever they might be found. Somewhere between the two extremes were the mass migrants—peoples on a move—who could be and were, by turns, peaceful and warlike as the situation demanded. Whatever their motives and actions, when travelers met other people, an almost inevitable exchange of culture and ideas, as well as goods, took place. In the process, the perceptual distances between cultures and peoples shrank.

Pilgrims on a spiritual quest of every sort—American Indian vision seekers as well as Jewish, Christian, Muslim, Hindu, and Buddhist pilgrims on their way to their respective holy places—were certainly not a new phenomenon, but their numbers seem to have increased exponentially during these centuries, and the guidebooks and places of refuge created to serve their needs proliferated at a high rate during this half millennium. One of the most fascinating pilgrims was Rabban (Master) Sauma (ca. 1225–1294), an Eastern (Assyrian) Christian monk of Ongut Turkic heritage who was born in northern China in the region of present-day Beijing and set out for Jerusalem with a disciple named Markos around 1275. An unsettled military situation prevented them from reaching Jerusalem (after all, no one said travel was easy and safe during these centuries), and both monks settled down in the Mongol il-khanate of Persia (essentially present-day Iraq and Iran), where large numbers of their coreligionists had resided since the fifth century. Eventually

Markos was named supreme catholicus of the Assyrian Church of the East, and in 1287 Il-khan Arghun chose Sauma to undertake an ultimately unsuccessful diplomatic mission to the Christian monarchs of Byzantium and Latin Europe. The monk used this opportunity to combine pilgrimage with diplomacy, first visiting the Church of Hagia Sophia in Constantinople, where he venerated many relics, including a picture of the Virgin supposedly painted by Saint Luke. From there Sauma went west. In Paris he venerated the presumed Crown of Thorns at the royal Sainte Chapelle, and in Rome, which he visited twice, he concelebrated mass with Pope Nicholas IV. After visiting the many churches of the city, Sauma requested and was granted the extraordinary privilege of being given a few holy relics from the papal trove “because he had traveled from such a distance,” and in 1289 he returned to the il-khanate, where he lived out his days. As far as we know, Sauma was the first traveler from northern China to make it all the way to the Far West in this period. Even more significant, merchants and missionaries from the Latin West, mainly Italian traders and Franciscan friars, were making their way eastward to Mongolia and China in this same period, thanks to the so-called Mongol Peace. Marco Polo and his father and uncle were only three of many.

Likewise in this period Muslim merchants and missionaries (often they were one and the same) were increasingly spreading goods and, more importantly, the faith into the grassland kingdoms of West Africa, along the Swahili Coast of East Africa, and into coastal Southeast Asia. In

Likewise in this period Muslim merchants and missionaries (often they were one and the same) were increasingly spreading goods and, more importantly, the faith into the grassland kingdoms of West Africa, along the Swahili Coast of East Africa, and into coastal Southeast Asia.

less pacific ways, Muslims out of present-day Afghanistan were carrying the faith into the Indian heartland.

Indeed, whether they were a people on the move seeking new and richer lands or conquerors seeking hegemony over other peoples, the mass migrants, rather than individuals, were the major story. Some of these migrations ended up as dead ends, such as the tenuous colonization of North American Vinland by the Norse.

Others were the roots of great states, such as the Tanguts, who established the XiXia empire along China's northern and western frontier, and the Qidan (Khitan) Mongols and Ruzhen (Jurchen), who successively established empires modeled on that of the Middle Kingdom in the Yellow River region of China. The greatest of them, of course, were the Mongols, who in the thirteenth century established hegemony over that portion of Eurasia that stretches from Korea to Russia-Ukraine, the greatest land empire in history.

Ultimately more significant than the Mongol conquests was the movement of Turkic peoples west and south into Southwest Asia (and ultimately into Southeast Europe) and India. Building from the Seljuk Turkish states that emerged in Southwest Asia in the eleventh century, the great Ottoman empire was alive and expanding by the mid-fifteenth century, with its crowning achievement being the capture of Constanti-

nople in 1453. Shortly after 1500, the equally great Mughal empire would emerge in India, the result of invaders from Afghanistan.

Mass migrations in the Western Hemisphere were equally significant. Algonquins, Sioux, and Athabascans were on the move in North America north of the Rio Grande, while in Mesoamerica Toltecs and Nahua were taking over central Mexico. One Nahua people, the Mexica, would rise from obscurity to control the great Aztec Confederation centered on Tenochtitlan. In the Caribbean and South America, important groups of migrant peoples included the Caribs, Arawaks, Chibchas, and Tupis. Far to the west in the Southern Hemisphere of the Pacific, a Polynesian people whom history would identify as the Maori were completing the Polynesian Triangle with their settlement of Aotearoa (New Zealand).

Some of these folk migrations engendered fierce resistance. Imperial China certainly did not readily surrender lands to the invaders from the steppe. One of the most historically important acts of resistance came in response to the Seljuk Turkish advance through the Byzantine lands of Anatolia. The result was a counter-invasion—the crusades out of Latin Christian Europe—that not only introduced a new people (Latin crusaders and colonists) into the lands of the eastern Mediterranean but also proved to be a significant flare-up of the until-then largely smoldering tension between Islam and Latin Christendom. The result was centuries of conflict in the Mediterranean and beyond.

One of the long-term results of both the crusades and the West's momentary taste of direct contact with East and South Asia during the age of the Mongol Peace was a state-sponsored attempt by Portugal and the Spanish kingdom of Castile-León to establish contact with the "Indies" by way of the ocean. The result by 1500 was discovery of and preliminary colonization of the Americas, with all of the mass migrations and dislocations that this would entail, and establishment of the Portuguese as a new factor in the Indian Ocean.

Another series of state-sponsored expeditions that merits notice, if only for their magnitude if not their results, were the seven great Ming voyages into the Indian Ocean that took place from 1405 to 1433. Although they have been the subject of some exaggeration and even downright fabrication by some writers motivated more by agenda and profit than historical accuracy, these massive fleets displayed the already centuries-long position of importance that China's sailors enjoyed throughout the Indian Ocean littoral.

As the entries that appear in this section demonstrate, the above catalogue of instances of travel and migration is inadequate to encompass all of the travel and exchange that was taking place in and even, in limited ways, between these two "world islands" and some of the areas between them in the period 1000–1500. By 1500, thanks to these almost universally anonymous migrants and travelers, much of the world had indeed shrunk.

■ Introduction: The Road to Sanctification—Pilgrimage Routes

Pilgrimage, a journey to a sacred place, is as old as the first human awareness of the Sacred Other and is part of every religious tradition, although some, such as Buddhism, Hinduism, most branches of Christianity, and Islam, emphasize this form of devotion far more than others. Pilgrims, whether traveling in large caravans or by themselves, undertake such journeys for a wide variety of reasons. In those religious traditions in which personal sin is a major issue, the expiation of guilt is often a driving force, the belief being that the privations of this pious excursion, the sanctity of the site visited, and the prayers, rituals, and often monetary contributions offered there combine to cleanse the soul. According to one legend, Mansa Musa of Mali went on *hajj* to Mecca in 1324 because he had inadvertently killed his mother. Pilgrimage can be and often is also a means of affirming one's membership in a faith community. This has always been a particular attribute of the Islamic *hajj* in which all pilgrims, regardless of status, wear the same simple clothes and perform the same rituals as an affirmation of their belonging to a single *umma*, or community of believers, and their equality before God. Needless to say, pilgrimages such as the *hajj*, which regularly drew worshipers from far-distant and widely scattered regions of the earth, were prime means for cultural interchange.

During the period 1000–1500, most of the ancient sites of pilgrimage remained popular, although some, such as the vast majority of the great Buddhist monasteries and shrines of India and Central Asia, disappeared from the scene due to a variety of religious, political, military, demographic, and environmental factors. The sweep of Islam through northern India and western Central Asia was accompanied by the substitution of a new set of pilgrimage sites—the tombs of Muslim saints—for former sites of Buddhist spirituality. Indeed, many Buddhist holy places were systematically destroyed or defaced by Muslims. The same was true for Hindu temples in northern and central India but to a far lesser extent, and ultimately most of the Hindu holy

places in areas ruled by Muslim princes remained vibrant magnets for devotees. In southern India, this was an age of widespread construction of magnificent new temples under the patronage of the Chola monarchs.

Across the oceans in the highlands of Mexico, the Toltec city of Cholula, which already for 500 years had served as a pilgrimage center for the cult of Quetzalcoatl, erected a massive ceremonial pyramid, the largest in Mesoamerica, around the year 1100. The size of this structure bears witness to the tens of thousands or more of Nahua people who annually trekked to Cholula to worship the god. By reason of the large numbers of pilgrims it attracted, Cholula also became the commercial nexus of a far-ranging trade network. Pilgrimage sites and the routes that led to them were good for business the world over.

One phenomenon that bears special notice is the creation of substitute “Jerusalems” for the Christian faithful in both the Latin West and Ethiopia. Jerusalem is sacred to three religions—Judaism, Christianity, and Islam—and during these centuries large numbers of members of all three faiths traveled to the holy city to worship at the Western Wall, the Holy Sepulcher, or al-Haram al-Sharif (the Noble Sanctuary). But what about persons who could not travel that far?

During the twelfth century and beyond, beginning with the Latin crusader occupation of Jerusalem (1099–1187), a number of substitute Jerusalem pilgrimage sites sprang up in Western Europe. Knights Templar constructed domed churches in France, England, Spain, and elsewhere in imitation of the Church of the Holy Sepulcher that the crusader-conquerors had rebuilt on the presumed site of Mount Cavalry and Jesus's empty tomb. Between 1228 and 1253 the Roman Church constructed the great basilica of San Francesco in Assisi to house the body of Saint Francis, the *alter Christus* (Other, or Second, Christ). Many of the architectural elements of this massive church were modeled on Jerusalem's Church of the Holy Sepulcher. In both cases, pilgrims were offered sanctifying alternatives to the costly and often dangerous passage to Jerusalem.

In late-twelfth-century Ethiopia, whose Christians claimed to be the direct spiritual descendants of ancient Israel, the Zagwe royal family began the process of transforming the sleepy town of Roha into a New Jerusalem. According to tradition, King (and Saint) Gebre Mesqel Lalibela began the enterprise following his pilgrimage to Jerusalem and that city's reconquest by Saladin in 1187. Whatever the truth of the legend, a New Zion arose at this spot as Ethiopia's holiest pilgrimage site, characterized by massive rock-hewn churches, each a symbolic memorial of the Holy Sepulcher. In memory of the saint responsible for the transformation, Roha's name was changed to Lalibela. This new Zion was undoubtedly begun, at least in part, to strengthen the royal legitimacy of the Zagwe dynasty, but less than a century later the family was supplanted by the Solomonids in 1270. On their part, the Solomonids, who claimed direct blood descent from King Solomon of Israel and the Queen of Sheba, proved to be generous patrons of the New Zion, and Lalibela's position as Ethiopia's primary pilgrimage destination grew accordingly.

So, while some pilgrimage venues disappeared or shrank in significance, others sprang up or expanded in importance. Whether old or new, pilgrimage sites that attracted worshipers from near and far continued to be, as they had already been for millennia, centers not only for devotion but also for commerce and the exchange of culture.

New Routes to Mecca

With the expansion of the Islamic domain and the consolidation of Muslim rule in the Middle East and beyond, business, social, and religious life thrived. Within the Islamic world, traveling for religious or economic reasons was made easier, and distances between place of worship and trade became closer by virtue of an improved infrastructure. The largest and most important routes for pilgrims to travel to Islam's holiest sites, Mecca and Medina, usually started in the urban centers of Cairo and Damascus. Pilgrims from the Maghreb (western North Africa and Islamic Spain) and sub-Saharan Africa joined caravans in Cairo, which then traveled for a month

➤ MANSA MUSA'S HAJJ OF 1324–1325

Kankan Mansa Musa I was king of Mali from 1312 until his death in 1337. Under his rule, his kingdom experienced a significant economic boom. Mansa Musa performed a legendary pilgrimage to Mecca in 1324–1325, which caused a sensation both within and outside of the Islamic world. During his travels to Islam's most sacred places he exhibited great splendor and spent large amounts of gold on servants of the Egyptian sultan and pilgrims in Mecca. Through the accounts of Venetian merchants who met Mansa Musa during his stay in Cairo, news about the powerful and rich kingdom of Mali passed to Europe for the first time. His grandiosity also led to a substantial decline of the value of the currency of that time, the Egyptian dinar. On his return, he experienced the side effects of this when he realized that the gold he carried with him had lost its value substantially, and he had to borrow money. However, he brought back with him numerous scientific and scholarly papers and treatises, as well as many Muslim scholars and craftsmen. Among them was the Arab poet and architect as-Sahadi, who changed the urban landscape of Timbuktu and built the Grand Mosque, as well as other public and sacred buildings. The city thus became the religious and economic center of western sub-Saharan Africa.

—*Sebastian Maisel*

or two through the Sinai and Hijaz (western Arabia) to Mecca. Travel accounts by Nasir-e Khosraw, Ibn Jubayr, and Ibn Battuta depict a lively picture of the people and places involved in this great annual endeavor. The Egyptian caravan brought with it the Kiswah, a precious cover for the Kaabah, the sacred cubelike structure that stood in the heart of Mecca's Great Mosque, that had to be replaced every year. Toward the end of the fifteenth century, some 30,000 African pilgrims performed the Hajj annually. Muslims from Anatolia, Iran, Iraq, and Syria formed another gigantic caravan that started in Damascus and reached Mecca a month later.

The Hajj was also considered a dangerous endeavor in which pilgrim caravans often were attacked on their way to Mecca by looting Bedouin tribes or religious competitors, such as the Shia sects of the Ismailis and Qarmatians, as well

as by crusaders. In 1183, for example, Reynald of Châtillon, lord of Transjordan, sank a vessel filled with pilgrims to Mecca in an attack on the rich ships and ports of the Red Sea. This violent relationship sometimes turned into a business, when the former attackers started to provide protection for the caravans and collected large tributes. During times of political instability, the Hajj was sometimes cancelled.

The pilgrimage routes to Mecca were part of an extended global network of trade routes connecting the Atlantic Ocean with southern China, an Afro-Eurasian trade zone that included large populations and different professions and lifestyles. Not only pilgrims but also merchants, businessmen, armies, ambassadors, teachers, beggars, and lawyers traveled on these roads. Non-Muslim minorities, such as Christians and Jews, also used them for economic and religious travel.

While most of the Islamic expansion prior to the year 1000 was directed north and east, the focus after the turn of the millennium was on sub-Saharan Africa. Trade relations already existed, and gold from the western Sudan was probably the most valuable commodity, which later contributed to the founding of powerful states on both sides of the Sahara, such as in Mali, Niger, and the Maghreb. Cities such as Algiers or Timbuktu became metropolises. Trade across the desert and along the Nile River further connected the Islamic West with the rest of Dar al-Islam and beyond. During an impressive and sensational pilgrimage in 1324–1325, the king of Mali, Mansa Musa, traveled to Mecca with a retinue that reputedly numbered 8,000. Travel also went both ways on these African pilgrimage routes. Muslim scholars, architects, entrepreneurs, and others from North Africa traveled to and settled in the new areas of Islamic sub-Saharan Africa, where they influenced the practice of Islam, the economy, the arts, and society significantly.

The Waning of Buddhism in China and along the Silk Road

Around 1000 CE Buddhist shrines in Central Asia and the pilgrimages connected with them began to decline. During its time in Central Asia and China, Buddhism had fallen victim to invasions, suppression, and the influx of new religions on several occasions. The difference was that this time it would not recover completely.

The decline dates to the Battle of the Talas River in 751 when Arab forces defeated the Chinese. After that Islam controlled the western end of the Silk Road and moved slowly eastward, assisted by the Muslim domination of trade. When Buddhist temples and shrines came under Muslim control, monks and nuns were forced to leave, buildings and monuments fell into disrepair, and Buddhist art was often defaced by Muslim iconoclasts. Increased warfare and decreased governmental support made pilgrimages to India increasingly difficult.

Despite the attempts to stamp out Buddhism, the remains of Buddhist culture could still be found. When the popular Iranian general Abu Muslim al-Khorasani was executed in 755 by order of the Abbasid caliph, rumors of his reincarnation began to circulate through the region of Khorezm (Khwarazm) in western Central Asia, a throwback to Buddhist beliefs. Buddhist statues were brought to Baghdad from Kabul in the ninth century, and Buddhist temples and monuments across Central Asia were recycled for new uses. A Buddhist temple in Bukhara (in present-day Uzbekistan) was turned into a fire temple by the Zoroastrians, and later Muslims transformed the area into a place for a twice-a-year fair where Buddhist statues were sold. In the Tarim Basin of eastern Central Asia, former Buddhist monuments became mausoleums for four imams.

The spread of Islam cut Chinese Buddhism off from remaining religious centers in India and Central Asia. Inside China Buddhism was briefly suppressed under Emperor Tang Wuzong (r. 840–846). Buddhist properties were seized, bronze and iron statues were melted down, and monks and nuns were punished and forcibly secularized. The emperor died one month after persecutions started, and later many of the more repressive

measures were relaxed, but the damage had been done.

Destabilization accompanied the fall of Tang in 907, and sections of the Silk Road came under Tibetan control. This was accompanied by a general de-urbanization along the northwest routes of pilgrimage. Although Buddhist pilgrims continued to visit the shrines, they did so in smaller numbers. As political turmoil continued and China broke into the Ten Kingdoms, eight in the south and two in the north, pilgrimages continued to decline. By the time of the Southern Song dynasty (1127–1279), most of northern China, including the Gansu Corridor, which gave ready access to the major western routes of the Silk Road, had fallen to the Khitan (Qidan), the Tanguts, and the Jurchen (Ruzhen), warlike peoples from China's periphery. The Tanguts, a Tibetan people, established the kingdom of XiXia in 1038, deposing the Tibetans and taking control of the Gansu Corridor. Despite the fact that the Tangut leaders were ardent Buddhists, it is possible that their invasion caused the monks of the Mogao Caves near Dunhuang to seal their 50,000 manuscripts, paintings, and other artifacts in the famous treasure room or Library Cave (Cave 17), in order to protect them. The Song dynasty made numerous peace agreements with the Tangut Liao dynasty and with the Jurchen, agreeing to make annual payments in return for peace in the region. However, in its isolation from other Buddhist centers China molded Buddhism into a distinctly Chinese form.

The Silk Road region was further disrupted when the Mongols attacked the Buddhist kingdom of XiXia in 1209 and the Jin empire of the Jurchen (who were predominantly Buddhist, as well) in 1211. By 1215 the Mongols had captured Zhongdu, the Jin capital (present-day Beijing), and four years later they were in the heart of Central Asia. Although the Mongols were fairly indifferent to religious differences, that did not stop them from plundering the rich Buddhist monasteries. This was especially true for the Buddhist Tanguts of XiXia, who refused to fully subordinate themselves to the Mongols in 1209. When they were fully subjugated in 1227, the Mongols took their revenge, destroying religious and secular buildings. The Tanguts are seen as the last Buddhists on the Silk Road proper. Ironi-

➤ DEFACING THE KIZIL CAVES

In 1906 and again in 1916, German expeditions headed by Albert Grünwedel and Albert von Le Coq visited the Buddhist temple caves of Kizil near the town of Kucha. The walls of these caves were covered with fabulous paintings depicting the life of the Buddha and other elements of worship. The caves, the oldest of which date to 500 CE, were especially important because they demonstrated a distinctively Kuchan style that was free from Chinese influence. China did not control Kucha until 658. Despite their remote location, the paintings had been savaged. Natives, knowing it to be excellent fertilizer, had shoveled out the loess soil that collected in and around the caves. The tools had damaged many of the paintings. Even the pigment was scraped off the walls to put on the fields. The paintings were not the only materials destroyed. Five wagon loads of manuscripts found by the locals were thrown into the river because they were afraid the writings were dangerous. Local Muslims had also defaced the figures by deliberately scratching out the eyes and faces. Both Grünwedel and Le Coq set to work removing remaining paintings by cutting them into sections and removing them from the walls of the caves. Much of the material they collected was sent to museums in Berlin. Unfortunately, many of the paintings were damaged or destroyed during the bombings of World War II.

—Rebecca Wendelken

cally, the Mongols later adopted a Tibetan form of Buddhism.

The Daoists took advantage of the Tanguts' plight by seizing the monasteries, although much of the property was later returned. Buddhism was supported under the Mongol khan Ogodei, and new Buddhist temples were built at Karakorum in the present-day Republic of Mongolia, but Buddhist monks were strictly controlled. Farther west, however, the Mongols destroyed Buddhist monuments in Balkh, Herat, and Peshawar.

In Western Central Asia the last vestiges of Buddhism were wiped out by the armies of Amir Temur, also known as Timur-i Leng and Tamerlane (1336–1405). In their ravaging of Central Asia and North India they destroyed monasteries and monuments.

➤ DUNHUANG—DEFACING THE MOGAO CAVES

The Buddhist Mogao Caves near the Silk Road town of Dunhuang were begun, according to tradition, in the late fourth century CE. For centuries hand-hewn decorated caves and grottoes were added to the site until they totaled 492. When trade shifted away from the trans-Eurasian trade routes, the caves were forgotten by the outside world until they were rediscovered by European explorers in the early twentieth century. Sir Aurel Stein explored the caves in 1907 and photographed the wall paintings but was unable to remove any. When the American art historian and adventurer Langdon Warner visited the caves in 1924, he found that many wall paintings had been defaced. In 1921 the Chinese government used the caves as temporary housing for 400 Russian soldiers, refugees from the White Army. During their six-month stay the soldiers defaced the frescos, gouging out the eyes and scratching graffiti into the fragile surfaces. Angered, Warner decided to preserve some of the remaining paintings by removing them. By covering the surfaces with solvent-soaked gauze, Warner was able to peel 12 paintings from the walls. Eleven survived the long trip to Harvard University's Fogg Museum in Cambridge and the tedious reattachment of the paint to a stable surface.

—Rebecca Wendelken

China experienced a Buddhist revival under the Ming dynasty (1368–1644). The founder of the dynasty was a Buddhist, and he worked to revive the native Buddhist sects and to suppress the power of the Tibetan Lamaist Buddhists, who had gained great power under the Mongols. Although the Ming supported Buddhism, Buddhism did not rise to its former glory.

Pilgrimage Literature—Islamic Rihlas and Western Christian Guidebooks

Pilgrimage literature in the Middle Ages spanned the range from useful guidebooks to colorful travelogs and fulfilled the practical needs of pilgrims as well as the interests of those who remained at home. Since pilgrimage involved dangerous travel, intercultural contact, and spiritual revelations at holy sites, the resultant tales merged adventure with religious contemplation and became very popular.

Much pilgrimage writing was practical. The twelfth-century *Liber Sancti Jacobi* (*Book of Saint James*), also known inaccurately as the *Codex Calixtinus* (*Book of [Pope] Calixtus [II]*), provides information for pilgrims seeking the popular shrine of St. James (Santiago) in Compostela, Spain. The book has chapters on the various roads to Santiago de Compostela with specific advice: locations of good hospices and drinking water, shrines with relics of other saints to visit en route, and the (highly stereotyped) characteristics of peoples and regions in France and Spain. About western Spain, the guide warns: “the impious Navarrese and the Basques not merely. . . rob the pilgrims going to St. James, but also . . . ride them as if they were asses and . . . slay them . . . Their face is ugly, and they are debauched, perverse, perfidious, disloyal, and corrupt.”

Other pilgrimage texts are individual accounts that convey the human experience of the journey, allowing the reader to share in the fears, dangers, excitement, and emotional responses of the writer-pilgrim.

Bernard of Angers, an eleventh-century cleric, wrote about the miracles of St. Foy of Conques, France, in the *Liber miraculorum Sanctae Fidis* (*Book of the Miracles of St. Foy*) of circa 1050. Bernard initially undertook his own pilgrimage to Conques to scoff at the ignorant multitudes of pilgrims who knelt before Foy's golden reliquary, which he called an idol, like a statue of Venus. Once he learned of the miracles enacted by the reliquary, however, Bernard had a change of heart and realized that the statue deserved veneration. His personal conviction moti-

➤ IBN JUBAYR AT MECCA

In this excerpt from his *rihla*, Ibn Jubayr describes how he prepared himself for the rites of the Hajj, which commence annually in Mecca on the seventh day of Dhu al-Hijjah. His preparations included the Umrah, or Lesser Pilgrimage, which is a series of devotional acts that puts the pilgrim into a proper physical and spiritual state for the Hajj proper. Several of the Hajj's prescribed rituals take place within the Haram es Sherif (the Noble Sanctuary), the mosque complex that houses the Kaaba. The Kaaba, the most sacred site in Islam, is a cube-shaped shrine believed to have been dedicated by Ibrahim (Abraham) for the worship of God.

Note how Ibn Jubayr's devotion did not preclude his enjoying the fruits of Mecca.

"Throughout the daylight hours of Wednesday we stayed resting at al-Qurayn [a pilgrimage staging post and camp], but when evening had come, we left it in the pilgrim garb to perform the *Umrah*, and marched throughout the night. With the dawn, we came near to the *Haram* and descended as the light was about to spread.

We entered Mecca . . . by the Imrah Gate. As we marched that night, the full moon had thrown its rays upon the earth, the night had lifted its veil, voices struck the ears with the *Talbiyat* [the pilgrim's ritual prayer: "Here I am, Lord. What is Your command?"] from all sides, and tongues were loud

in invocation, humbly beseeching God to grant them their requests, sometimes redoubling their *Talbiyat*, and sometimes imploring with prayers. Oh night most happy, the bride of all the nights of life, the virgin of the maidens of time. . . .

We took lodging in Mecca at a house called *al-Halal* ["that which is lawful"] near to the Haram and the Bab al-Suddah, one of its gates, in a room having many domestic conveniences and overlooking the Haram and the sacred *Kaaba*. . . .

The choicest of the fruits we tried were the water-melon and the quince. All [Mecca's] fruits are good, but the water-melon has a particular and exceptional merit in that its odor is the most fragrant of smells and the best. When someone approaches you with one, you find the fragrant odor coming first to you so that from the enjoyment of its sweetness you almost abstain from eating it; and when you taste it, it seems to you like sugar-candy or purest honey. It may be that the reader of these worlds will think that in this description there is some hyperbole. No, in the name of God it is more than I described, and above what I said."

The Travels of Ibn Jubayr, trans. by R. J. C. Broadhurst (London: Jonathan Cape, 1951).

vated the zeal with which he details Foy's many miracles.

While seeing sacred places inspired pilgrimage, an avid interest in sight-seeing and curiosity about other cultures are evident in many texts, without the negative generalizations of the *Codex Calextinus*.

Ibn Jubayr (1145–1217) went on pilgrimage to Mecca in 1182 and traveled for two more years, visiting Jerusalem, Medina, Damascus, Mosul, Acre, and Baghdad. His account was among the first of the genre of the Islamic *ribla*, or pilgrimage travel journal. He includes many intercultural experiences, such as his practical advice for Muslims traveling on Genoese trade ships together with Christian pilgrims and his wonder at

the luxurious lifestyle of the Christian king William II of Sicily, who employed Muslim physicians, astrologers, and servants.

The most extraordinary writer of an Islamic *ribla* was Ibn Battuta (1304–1368 or 1377). Born in Morocco, he went on *Hajj* to Mecca in 1325 at age 22 and continued traveling for nearly 30 years, covering about 75,000 miles (120,000 kilometers) and about 44 present-day countries. His *ribla*, which was composed and amplified by a professional writer, Ibn Juzayy, to whom Ibn Battuta narrated his adventures, describes his extensive pilgrimages to see holy sites and Muslim saints. It also includes, however, tales of the cultures, geography, climates, and sights he observed in the Middle East, India, China, and

sub-Saharan Africa. His contacts with other faiths are particularly interesting: a Hindu yogi levitating himself, Byzantine Christians denying him entrance to the Church of the Hagia Sophia in Istanbul for refusing to bow before the cross, and worshippers of the Mongol emperor of China creating a huge burial mound, filled with furnishings and slaves and topped with horses impaled on staffs. Ibn Battuta marvels further at other Muslim cultures, such as the matrilineal Walatans (in present-day Mauritania) whose beautiful women were shamelessly unveiled and had sexual relations with many men, all the while keeping up with their Islamic prayers.

The *Sanctae Peregrinationes (Holy Pilgrimages)* by Bernhard von Breydenbach (1440–1497), a canon of Mainz, was published in 1486 and became Europe's first best-selling work of printed, mass-produced pilgrimage literature. Bernhard describes his trip from Venice to Jerusalem, listing many sites in the Holy Land. He provides a sample contract with a ship's captain, Arabic word lists, and tips about seasickness and delousing. Elaborate woodcuts by Erhard Reuwich illustrate the holy locales as well as exotic costumes and animals. Bernhard apologizes for his profound interest in other cultures and includes many entertaining sidebars describing altercations about camels, wonders such as egg incubators, and the time he and his companions were mistaken for slaves.

Felix Fabri (1441–1502) traveled with Bernhard. Felix set out intending to write a narrative of his pilgrimage and prepared by reading all available pilgrimage accounts and taking careful notes during his trip. The resultant *Evagatorium (Wandering)* constitutes the most thorough Western pilgrimage account, employing Felix's preacherly rhetoric and classical learning to their full advantage. Inversely to Ibn Jubayr, Felix traveled on an Islamic vessel and recalls how the pilgrims sang the Christian hymn of divine praise, the *Te Deum*, softly when approaching Jerusalem so as not to upset their Muslim escorts. At every turn he describes his personal emotions, admitting to boredom on the journey, fear while at sea, and pure joy while he wept before the Holy Sepulcher despite being mocked by other brutish pilgrims for his exuberance.

Old and New Christian Sites of Pilgrimage

Although the earliest Christian pilgrimages were to places associated with the life and death of Jesus Christ, several important new pilgrimage sites emerged during the Middle Ages. It was believed that exposure to such sites, especially the holy relics that were enshrined there, provided spiritual graces for the pilgrim willing to endure the hardships of travel. Secular and ecclesiastical rulers also benefited from the promotion of such piety, as often the surrounding economies of popular pilgrimage sites were partly, and sometimes wholly, dependent on money spent by pilgrims.

A reinvigorated pilgrimage movement to the Holy Land emerged in the eleventh century as Europe experienced significant economic and population growth. Although Muslims were generally loath to interfere with the profitable pilgrimage traffic, the increase in the numbers of pilgrims headed to the Holy Land happened at a time when the Seljuk Turks became a destabilizing power in the region, and this resulted in several clashes between the two groups. Consequently, reports of the Turkish abuse of Christian pilgrims contributed to popular enthusiasm in Europe for the birth of the crusading movement at the end of the century. Indeed, the crusades were initially understood as armed pilgrimages, with the granting of indulgences (release from

➤ ANNALIST OF NIEDER-ALTAICH—THE GREAT GERMAN PILGRIMAGE OF 1064–1065

European pilgrims traveling to the Holy Land were sometimes considered a nuisance by local communities and occasionally suffered attacks by other Christians as they made their way through Hungarian and Byzantine territories. Yet during the eleventh century such pilgrims became much more concerned about encountering militant Turks and Arabs along the way. These concerns, however, seem to have done little to dampen the enthusiasm of European pilgrims for the Holy Land, as the great German Pilgrimage of 1064–1065 reportedly had more than 12,000 participants. The following account, provided by the contemporary annalist of Nieder-Altaich, gives a sense of the dangers they faced.

“They [German pilgrims] left Constantinople a few days later and, after passing through various difficulties and tribulations, came to Latakia [a port city in Syria]. Bishop Gunther made their troubles clear when he wrote from Latakia to his people who were still at home. He said, among other things: ‘Brethren, we have truly passed through fire and water and at length the Lord has brought us to Latakia, which is mentioned in the Holy Scriptures

as Laodicea. We have had the Hungarians serve us without faith and we have had the Bulgarians prey secretly upon us; we have fled from the open raging of the Uzes [Oghuz Turks] and we have seen the Greek and imperial arrogance of the citizens of Constantinople; we have suffered in Asia Minor, but worse things are yet to come.’

While they were staying for a few days in Latakia, they began to meet each day many people returning from Jerusalem. The returning parties told of the deaths of an uncounted number of their companions. They also shouted about and displayed their own recent and still bloody wounds. They bore witness publicly that no one could pass along that route because the whole land was occupied by a most ferocious tribe of Arabs [here the author errs; they were Turks] who thirsted for human blood.”

Annales Altahenses Maiores, 8, a. 1065, MGH, SS. XX. 815–817, trans. James Brundage, *The Crusades: A Documentary History* (Milwaukee, WI: Marquette University Press, 1962), 4.

penance for forgiven sins) similar to those given for other pilgrimages.

The establishment of four crusader states in the wake of the First Crusade contributed to an even greater upsurge in pilgrimage activity, as Christian rulers encouraged pilgrimage to the Holy Land and made efforts to provide security and sanctuary for those willing to hazard the long and often dangerous journey. The first military-crusading orders, namely the Templars and the Hospitalers, were initially established in the twelfth century to protect and serve pilgrims in the Holy Land.

The many pilgrims who made the journey were rewarded with the opportunity to worship at hundreds of Christian shrines. They included such important sites as the place of Christ’s birth in Bethlehem; the Church of the Holy Sepulcher, containing both Mount Calvary and the tomb from which Christ was believed to have been bodily resurrected; and the newly discovered Tomb of the Patriarchs in Hebron, believed to be

the resting place of the biblical patriarchs and matriarchs Abraham, Isaac, Jacob, Sarah, Rebecca, and Leah and a site revered by Jews, Christians, and Muslims alike.

For pilgrims making their way to the Holy Land, a stop in the Byzantine capital city of Constantinople would have been highly desirable on account of the enormous collection of relics it housed. Sources from the crusading era record a number of impressive relics among the city’s collection, including traces of the blood of Christ, Christ’s Crown of Thorns, pieces of the True Cross, the bones of John the Baptist and St. James the apostle, and countless other relics of Christian virgins, martyrs, and saints. In addition to Constantinople, pilgrims visited other sanctified locales on their way to the Holy Land (or to other major pilgrimage sites) due to the availability and popularity of a number of guidebooks that provided them with information on holy sites of interest along the way as well as the safest routes for travel and lodging.

Abbey Church of Sainte-Foy in Conques, southern France, begun about 1050. The city of Conques possesses the relics of the child martyr St. Foy, and was a stop for pilgrims as they traveled to Santiago de Compostela. (Phillip Capper)

The city of Rome was perhaps the most important Christian pilgrimage destination in Europe. Rome's spiritual prestige was due to its having been the city where the apostles Peter and Paul, as well as numerous other Christians, had been martyred and the fact that it was the see, or seat of power, of the Roman pope. Pilgrims who were not always able to make the longer and more dangerous journey to the Holy Land often opted for Rome, where they could visit the tomb of St. Peter, the catacombs in which early Christians had been buried, and numerous other relics of early Christian saints and martyrs. An enormous number of pilgrims visited Rome after Pope Boniface VIII declared a Jubilee Year in 1300, a special year of remission of sins and universal pardon, for those who made a pilgrimage to Rome. Additional holy years were announced by popes over the ensuing centuries, and these holy years also drew large crowds of pilgrims.

The Italian cities of Assisi and Turin were also major pilgrimage destinations. Assisi rose to prominence as a site of pilgrimage during the thirteenth and fourteenth centuries, when pilgrims came to visit the places most associated with the life of St. Francis of Assisi, as well as the tomb of St. Clare, his female counterpart. The city of Turin also achieved fame as a pilgrimage

site in the later Middle Ages, as pilgrims flocked there to see the Shroud of Turin, believed to be the burial shroud of Jesus on which his image had been imprinted.

The most important European pilgrimage site outside of Rome, however, was Santiago de Compostela in Galicia, or northwestern Spain. Pilgrims believed that the bones of the Apostle James the Greater (Santiago) were miraculously transmitted to Spain not long after his death in Jerusalem. These bones were then buried where a shepherd had spotted a star, and the first cathedral of Santiago de Compostela was consecrated over the spot in the ninth century, with larger cathedrals to follow as pilgrim traffic grew. Enormous numbers of pilgrims from throughout Europe made their way to Compostela, especially after the year 1000. Various routes to the tomb of St. James were mapped out, several popular guide books were written for the edification of pilgrims, and, as was true for routes to other popular pilgrimage sites, numerous churches, shrines, and hostels along the way provided assistance, lodging, and food. Moreover, many sites along the various paths to Compostela, which were collectively known as the Way of St. James, became pilgrimage destinations in their own right, such as the small southern French city of Conques, which possesses the relics of the child martyr St. Foy.

The most-visited pilgrimage site to emerge in northern Europe during the later Middle Ages was at Canterbury, England. Beginning in the late twelfth century, pilgrims flocked to see the tomb, then later the shrine, of the martyr Thomas Becket (d. 1170). The shrine's popularity in England began to wane with the onset of the English Reformation, and the shrine was destroyed in the mid-sixteenth century.

Selling Sanctity—The Pilgrimage Trade Is Good Business

Although motivated by otherworldly goals, pilgrimage brought immediate earthly rewards to popular destinations. Taxes on pilgrims, donations to shrines, and purchases made at the markets that sprang up around holy sites allowed pilgrimage towns to thrive.

The pilgrimage trade could single-handedly support a local economy. On the sacred mountains of Tibet, strict parameters preserved the hallowed landscape, forbidding hunting, land cultivation, and husbandry of unclean animals. Income from the *Bonpo* (devotees of Bon, Tibet's ancient religion that venerates nature) and Buddhist pilgrims enabled the survival of the resident communities. In India, income from massive Hindu temples, like that of Nathdwara in Rajasthan, could sustain over 1,000 families.

Pilgrimage could also permit a town to accrue great wealth. Due to the miracles that followed Thomas Becket's murder and their subsequent promotion by the town's clergy, Canterbury, England became a major pilgrimage center, at its height rivaling even Rome and Jerusalem. The shrine's healing powers, extolled in Chaucer's *Canterbury Tales*, motivated vast numbers of pilgrims during the Black Death in the 1340s. The plentiful visitors (100,000 during the 1420 Jubilee alone) and sustained royal patronage yielded great prosperity. Until the sixteenth century, Thomas's tomb remained among the greatest concentrations of wealth in England.

Such accumulation of revenue was possible due to the expenditures required of pilgrims on their trek. Food and shelter were sometimes free, such as the provisions placed in Buddhists' begging bowls or the housing offered Christians in Jerusalem by the Hospitalers, but they usually required money. Donations and further pur-

➤ PILGRIMAGE SOUVENIRS—CHRISTIAN AMPULLAE AND TIBETAN BUDDHIST AMULETS

Christian and Buddhist pilgrims purchased inexpensive souvenirs to commemorate their travels.

Christians collected clay or lead ampullae (small round bottles with two handles) filled with water, oil, or dust from holy sites. Extremely popular from the twelfth to fifteenth centuries were those from the shrine of St. Demetrius in Thessalonica, the city's patron and a popular warrior saint throughout the Christian East. Miraculous oil called *myron* flowed from the saint's remains, and droves of pilgrims brought flasks home. These ampullae, worn around the neck, bore images of the saint and prayers, such as "Anointed by thy blood and *myron*, the bearer prays thee to be his warm defender."

Common Tibetan souvenirs were clay reliefs called *tsha-tsha*, originally attained at Indian pilgrimage sites and produced after the eleventh century at Tibetan shrines. They were worn within amulets or deposited inside devotional stupa towers. Recalling the Christian ampullae, the *tsha-tsha* could contain relics, since the ashes of lamas were sometimes kneaded into the clay. They depicted holy figures, like the ampullae, but their texts were Buddhist doctrine rather than individual requests: "The Tathagata [the Buddha], the great truthful ascetic, revealed the cause of the things having their beginning from a cause, and their disappearance."

Both of these forms of souvenirs allowed pilgrims to wear upon their bodies relics or clay from the holy site, enabling them to retain this proximity at home.

—Annika Fisher

chases, such as incense or flowers, were necessary for rituals. Souvenirs were also common.

The French town of Conques was supported from the ninth to the thirteenth centuries by pilgrims visiting St. Foy. The saint's bones resided in a statue that embodied her requests for gifts. Miracle accounts report how Foy, who was martyred as a young girl, particularly desired jewelry. Pilgrims were compelled to "donate" such items after Foy appeared—and occasionally threatened them—in visions. The reliquary that contained St. Foy's earthly remains was such a

reliable source of income that it was paraded through the countryside whenever the cathedral needed funds.

Conques lay on the *iter Sancti Jacobi* (Route of Saint James), a major pilgrimage road that culminated in Santiago de Compostella, Spain. The pilgrimage business was so lucrative at Conques that the burghers and clergy fought for decades over control of the marketplaces. When cathedral-owned souvenir stands cut into the people's profits, rioters nearly assassinated the bishop. The clergy claimed it required the funds to aggrandize the cathedral, which would in turn encourage more pilgrimage. Such tactics spurred the great church-building boom of the High Middle Ages.

Whereas Christian pilgrims were exempt from taxes in Europe, cities on other continents often taxed pilgrims. Muslims arriving in Mecca had to pay eight gold *dinars* to the amir or they, together with the ship captains who brought them, were severely punished. At times, such heavy fees even worked to decrease the number of pilgrims undertaking the *hajj* to this holiest site in Islam. Excessive taxation similarly affected the Anasazi pilgrimage destination of Chaco Canyon in New Mexico. Around 1050, construction of elaborate tombs, ceremonial *kivas*, and broad roads jumped 600 percent as the area became a major center. By 1111, however, the Anasazi ceremonial capital moved north to a site today known as Aztec, New Mexico, likely due to the excessive tribute pilgrims were charged.

Commercial venues also worked in convergence with pilgrimage traffic. Medieval European markets were timed to fall upon the feast days of local saints when pilgrims flooded the towns. A similar symbiosis occurred at the Hindu Vitthala temple in Vijayanagara, where markets surrounded the shrines and pathways led the pilgrims away from residential zones and toward these ritual and commercial areas.

Many pilgrimage sites were along trade arteries, like Mecca on the major route between India and the Mediterranean, or the Buddhist caves near Dunhuang in the Gobi desert along the Silk Road. Dunhuang's success at appealing both to travelers motivated by profit and by piety made it wealthy for over 1000 years. Genera-

tions of artists were employed decorating the 492 grottos of the cave complex.

North American Indian Travelers to Pipestone Quarries

Throughout much of aboriginal North America, the ceremonial pipe complex, consisting of tobacco, kinnikinnick (a mixture of bark, tobacco, and dried leaves—usually bearberry), pipe stems, and pipe bowls has been integral to religious, sociopolitical, and economic dimensions of indigenous life. Although the ceremonial use of pipes crafted from pipestone extends into prehistoric times, it was not until 1836 that information about the quarry near Pipestone, Minnesota, where Native Americans mined the soft red stone used in making pipes, was popularized through the writings and paintings of American artist George Catlin and later in the poetic musings of Henry Wadsworth Longfellow in *Songs of Hiawatha*.

Native Americans of the Great Plains, Woodlands, and Southeast revere pipestone due to its associations with the ancestors and legendary beings such as the Thunderbeings and the Little

People. In the following Dakota legend, described by Catlin, the sacred nature of the pipestone is revealed.

“At an ancient time the Great Spirit, in the form of a large bird, stood upon the wall of rock and called all the tribes around him. Taking out a piece of the red stone, he formed it into a pipe and smoked it, the smoke rolling over the whole multitude. He then told his red children that this red stone was their flesh, that they were made from it, that they must all smoke to him through it, that they must use it for nothing but pipes: and as it belonged alike to all the tribes, the ground was sacred, and no weapons must be used or brought upon it.”

Long before the arrival of Euro-Americans, indigenous groups of the Great Plains, Great Lakes, and Mississippi Valley began adopting rituals including the smoking of the Calumet (or peace pipe) in conjunction with trading, the establishment of alliances, and treaties. In the eastern Plains, ritual use of the Calumet pipe extends back to as early as 1200 CE. Between 1542 and 1673 this ceremonial complex spread from the Great Plains through the Mississippi River valley. The establishment of bonds between independent clans or ethnic groups and the barter of pipestone and Euro-American material culture may have catalyzed the diffusion of the Calumet ceremonies, particularly to the Illinois tribe by the Osage and the Missouri tribes in the 1700s. By the eighteenth century the Calumet ceremony was well established in many parts of the Southeast, including the Lower Missouri Valley.

Native Americans have traditionally mined and traded pipestone from multiple quarries in southeastern South Dakota; southwestern Minnesota; northwest, central, and south-central Wisconsin; and places in Illinois and Kansas. It was not uncommon for representatives of different ethnic communities to share control of the same quarries. For example, tribes from the Appalachians to the Rocky Mountains shared the pipestone quarries of Minnesota. Among them were the Ottawa, Omaha, Iowa, Ponca, Lakota, and Ojibwa tribes. Each quarry was considered sacred

Pipestone Quarry, Minnesota. (National Park Service)

➤ WHAT IS PIPESTONE?

Pipestone is a soft red stone that many indigenous groups of the Great Plains and Eastern Woodlands use to make ceremonial pipes in which tobacco or kinnikinnick is smoked. Pipestone is composed of argillite, a clay that has metamorphosed into stone. It can be fashioned into many types of pipes including tubular, disk, elbow, and t-shaped peace pipes called calumets. One variety of pipestone known as Catlinite is named after the nineteenth-century American artist George Catlin, who recorded information about the quarry now preserved at the Pipestone National Monument. Other varieties include Kansas pipestone and Wisconsin pipestone.

—Alex K. Carroll

and neutral ground among Native Americans, who shared historic alliances as well as animosities, and thus served as a region of refuge where traditional enemies could barter and trade without fear of reprisal. Widespread documentation of maintenance of peace at quarries extends from Wisconsin to Missouri River sites, where Lewis and Clark passed during their famous expedition that terminated in Fort Clatsop, Oregon.

■ Introduction: Peoples on the Move—The Passage of Willing and Unwilling Migrants

Humans have always been on the move, and their movements have been both voluntary and otherwise. During the period 1000–1500, large numbers of persons were displaced due to the vicissitudes of war and other forms of violence that uprooted them and set them on the road to somewhere else. An unknown number of these persons were enslaved and were either brought to slave markets and sold there or carried off to their captors' homes. In any case, whether sold off or retained, whether they served as common laborers or were valued for their special talents, they normally could expect to be transported far from home. Thus, in order to beautify his capital of Samarkand, which he was rebuilding into a new city, Timur-i Leng carried off thousands and probably tens of thousands of captive artisans of every sort from the lands his armies conquered. We can only guess at the numbers of persons who, while not enslaved, were forced by the circumstances of the campaigns of the Mongols and Timur, as well as numerous other invaders, to leave ravaged cities, towns, and countrysides and to seek out better and more peaceful lands. Then there were persons who, while remaining free, were forced to resettle in alien lands as part of a policy of systematic population readjustment followed by either their conquerors or the polities into which they had been born. This phenomenon was at

least as old as the ancient Assyrians, who carried the so-called Ten Lost Tribes of Israel into captivity, resettlement, and change in ethnic identity, and it was practiced during this half millennium by the Incas as a means of integrating recently conquered peoples into their fast-expanding empire.

Not all disasters and crises precipitate mass movements of peoples, however. From what we know of the devastating onslaught and immediate effects of the Great Pandemic that swept through Eurasia and North Africa in the mid-fourteenth century, it does not appear likely that significant numbers of persons fled their locales in order to escape the disease's impact. Possibly new evidence will force a reevaluation of that conclusion.

In addition to forced migrations, there were the voluntary movements of peoples in groups ranging in size from a family to huge confederations of tribes. In most cases they were seeking better lands and opportunities, such as the Polynesians who discovered and settled Aotearoa (present-day New Zealand). In some cases they took advantage of the weakness of a people or state into whose lands they moved. Often, but not always, these migrations were accompanied by violence, such as the Turkic movement into Byzantine Anatolia and the migration of the Aztecs into central Mexico. In other cases they re-

settled themselves in lands into which they were invited (or ordered) by a state that desired their presence there for political and/or economic reasons. In this manner, the Chinese empire had already for centuries encouraged migration of Han Chinese into border areas that were coming under direct governmental control and continued these policies during this 500-year period. Peasant farmers were particularly important in this process.

Outsiders can also be invited in, such as when a state invited in border “barbarians” to serve as mercenaries in its armies, thereby not only building up its frontier forces but also pacifying potential or past enemies. Such was often the case along the Chinese northern and western borders. This policy could and sometimes did prove counterproductive, as when the Jurchen (Ruzhen), whom the Northern Song dynasty used as allies in its struggles against the Khitan (Qidan), turned on the Chinese empire and carved out the Jin empire along the Yellow River in the traditional heartland of China.

All of these migrations must be distinguished from the ways of pastoral nomads, who normally follow fixed seasonal patterns and pathways, and do not deviate from these annual cycles and well-established pasturages unless extraordinary factors occur to force them to do otherwise. Such was the case when various Central Asian tribes and confederations abandoned their regular patterns of seasonal migration and became a people on the move, pushing into alien lands at the expense of the people already settled there. The most dramatic and historically significant example of this was, of course, the carving out of the Mongol empire in the thirteenth century.

Whatever the motives or factors behind re-settlements such as these, each and every movement contributed to significant shifts in the demographic face of the world well before the globalization that followed upon the heels of the European colonization of the Americas.

—*Alfred J. Andrea*

North African and Arab Migrants to Sub-Saharan Africa

Migrants from North Africa and the wider Arab world significantly altered the cultural and reli-

gious landscapes of sub-Saharan Africa between about 1000 and 1500. Not only the expansion of Islam via state building but also the regular movements of travelers, merchants, pilgrims, clerics, artisans, and others created significant and lasting connections across the regions of West Africa and coastal East Africa. Opportunities for conversion and commerce led to political, social, and economic contributions to urban growth.

Ancient commercial networks in both regions attracted Muslim merchant-clerics with the spread of Islam after the seventh and eighth centuries CE. Converts to the Islamic faith grew in urban enclaves, which became crucibles for the transfer of language and culture.

By the fourteenth century Berber and Arab migrants in larger numbers had spread across the lands west and south of Egypt (as far as Mauritania), known collectively as the Maghrib (the West). Largely pastoralists and mercenaries, they enabled warlords and states to collect taxes and tribute along the caravan routes at the desert's edge.

Muslim elements similarly spread down the Red Sea and Indian Ocean into East African coastal settlements. Converted Oromo and Sidama pastoralists in the Horn of Africa traded salt and other goods. By the thirteenth century commercial agents had planted deep local roots through intermarriage in and around urban centers. The mix of bilingualism and imported religious education furthered the cultural and social changes in the African communities that housed migrants, creating by the fifteenth century what one Islamic writer considered to be the hemisphere's southern fringe of Islam.

Migrants contributed to West Africa's vibrant commercial connections between the hinterlands of the Senegal and Niger rivers and most of Eurasia. In East Africa, Muslim merchants took advantage of the pattern of monsoon winds to build the region's maritime trade with parts of South, Southeast, and East Asia. Successful merchants ruled their sultanates from coastal sites, such as Zanzibar, Pate, Lamu, Kilwa, Mombasa, and Mogadishu. The widespread adoption of the migrant's religion also stimulated intellectual life and introduced unifying features such as the Arabic language and script and the Islamic ounce (weight system) across vast regions of the continent.

➤ MANSA MUSA BRINGS NORTH AFRICAN SCHOLARS TO MALI

The pilgrimage of Mansa Musa to Mecca and Medina (1324–1325) secured the reputation of Timbuktu as the spiritual and intellectual capital of Islamic West Africa. A devout Muslim, the ruler of Mali is said to have carried with him forty mule-loads of gold and built six mosques along the way. According to the great chronicler of Timbuktu, Mahmud Kati, when the king reached Mecca, he offered vast sums of gold to any cleric-scholar who would follow him back to his homeland when he returned. Not only scholars, but also manuscript books made the journey. By the sixteenth century, the Timbuktu book trade was reportedly more lucrative than any other business. The scholar Mahmud Kati himself owned a vast library and more than 3,000 of the books from his collection are still preserved by Kati's West African descendants.

—Candice Goucher

The African languages most heavily influenced were Hausa and Kiswahili, both of which became regional *linguae francae*, especially in urban centers. The spread of literacy resulted in the conversion of oral traditions into written records after the tenth century. In West Africa, *tarikhs* were traditional histories written down in Arabic that recorded the genealogies and local legends. Ruling groups in coastal East Africa professed Islam, and their cultural heritage reflected historical links with the Arabian and Persian gulfs as well as African groups. While not all the places mentioned by chroniclers can be matched to archaeological sites, it is clear that the widespread exchange of African gold and ivory for Chinese porcelain, silks, and other luxury goods created a cosmopolitan lifestyle for city dwellers and elites.

The Turkic Invasions of India

The Turkic invasion of India began in the eleventh century CE by the Turkic people of Afghanistan under the leadership of Mahmud of Ghazna (971–1030) and was continued by the later Ghaznavid sultans for the next 175 years. At its height, the Ghaznavid empire stretched from Afghanistan into eastern parts of the Punjab in India, and its major cities were Kabul, Ghazna, and Lahore. By 1160, another Turkic group of warriors from Afghanistan, the Ghurids, under the leadership of Muhammad of Ghur (r. 1173–1206) conquered Ghazna. By 1187, the Ghurids assumed control of Lahore and continued raiding into India. Ghurid control of India lasted until 1215.

Prior to the Turkish conquests, the northern alluvial plain of Punjab was home to internecine conflict among the various Hindu and Muslim Rajput kingdoms, the Rajputs being the major *jati* (subcaste) of the warrior Kshatriya *varna* (caste) of northwestern India. Also present in the area were the Ismaili Shia kingdom of Multan and Buddhist and Jain communities of missionaries. Mahmud of Ghazna's defeat of the Hindu Shahi king Jayapala in 1001 marks the beginning of the intensified Islamic conquest of northern India. Mahmud was a staunch orthodox Sunni and saw himself as the defender of the Abbasid caliphate. Consequently, he declared a jihad against the rival Ismaili Fatimid caliphate that had made inroads into India. As such, he called for *ghazi* troops, or "warriors of the faith," to push into the subcontinent and defend Islam against heterodoxy. The Ghaznavids launched nearly constant raids into India, and these operations were financed largely through looting and destruction of the rich Hindu temples and Buddhist monasteries that were prevalent in northern and western India.

After defeating the Ghaznavids in 1186, Muhammad of Ghur continued raids into India. Unlike the jihadist Ghaznavids, the Ghurids waged campaigns based on expansion, conquest, and desire for booty. The Ghurid military was formi-

dable and swept the entire Gangetic plain all the way to Bengal. The Senas, Shaivite Hindus (worshippers of Shiva), attempted to resist the Ghurid attacks in Bihar and Bengal by installing defensive garrisons near the walled citadels of two major Buddhist monasteries at Odantapuri and Vikramashila (both located in present-day Bihar). In 1199–1200, the Ghurids attacked and razed them, thus almost totally destroying the Buddhist presence in northern India. The death of Muhammad of Ghur in 1200 was effectively the end of Ghurid central control in India. By 1206, Turkish slave soldiers founded the Delhi sultanate, and several Turko-Afghan dynasties ruled from the city of Delhi until 1526.

The Turkic invasions of India are a source of controversy and tension for historians of the subcontinent. Some scholars point to the destruction of Hindu temples, the virtual eradication of Buddhism from India, and the casualties of constant warfare as devastating consequences of the Islamic conquest. Other scholars contest the loss of life and degree of destruction, maintaining that Hindus were always treated as *dhimmi* (protected people), and Muslim generals often co-opted Hindu warlords to do much of the fighting and looting. Furthermore, the Turkic presence, specifically during the Delhi sultanate, created a great cultural renaissance in language, architecture, and religion. Sufism, or mystical forms of Islam, spread deeply into the subcontinent, created new forms of philosophy and literature, and attracted many native Indians to Islam who perceived its mystical forms of devotion as consonant with Hindu bhakti and Buddhist Mahayana traditions. Persian as a literary language and Persian thought and architectural forms also became an integral part of the rich cultural matrix of Indian lands subject to Muslim authority.

➤ MAHMUD OF GHAZNA—THE SWORD OF ISLAM

Mahmud of Ghazna (971–1030) was the son of a Turkish slave and personal guard to a Persian Samanid general. After the overthrowing of the Samanids, Mahmud rose to become an independent ruler, or sultan, founding the Ghaznavid dynasty that stretched from eastern Iran to the Yamuna River in India. As successor to the Samanids, Mahmud consolidated all the smaller Afghan kingdoms and eastern Iranian states under his authority. Among his many accomplishments, he is remembered for his staunch Sunni orthodoxy, and his jihads against Shias and Hindus earned him the sobriquet “The Sword of Islam.”

Mahmud turned the city of Ghazna into the major cultural and Sunni religious capital in Central Asia. He founded madrassas and built monumental architecture, gardens, palaces, and caravansaries. Furthermore, he patronized important scholars such as Ferdowsi, author of the *Shahnameh*, and Al-Biruni, author of *The History of India*. Mahmud promoted Persians into his court administration and favored Persian language and customs over Turkish ones.

—Ruma Niyogi-Salhi

Mahmud of Ghazna, leader of the Ghaznavid dynasty, is portrayed in Rashid-al-Din's *The Arrival of an Indian Embassy before Sultan Mahmud of Ghazna*, painted in the late fourteenth century. Ghazna, who ruled from 998 to 1030, expanded the dynasty into present-day Iran and northern India. (Burststein Collection/Corbis)

Before the Mongols—The Continuing Movement of Border Peoples into China—Khitans (Qidan), Tanguts, and Jurchens (Ruzhen)

Between the fall of China's Tang dynasty in the early tenth century and the conquest by the Mongols in the thirteenth century, northern and northwestern China saw the creation of many peripheral states as nomadic and seminomadic groups wrestled for control and the right to extract tribute. In some cases these nomadic groups even took control of Chinese territory, ruling it for extended periods.

Early in the tenth century the seminomadic Khitans conquered portions of northern China, Mongolia, and Manchuria under the leadership of Yelu Abaoji. He seized the reins of power within the tribe, taking complete control and ending

the Khitans' tradition of a three-year rotating leadership. The Khitans had tried many times before to set up an independent state but were always thwarted by China. Finally in the political turmoil that accompanied the fall of the Tang dynasty, they set up a dynasty of their own called the Liao (907–1115). Their dual governmental organization combined Khitan traditional law with Chinese bureaucratic methods. Under this dynasty, Chinese-style rule was introduced deeper into Mongolia than ever before. The Liao divided their empire into two parts: the northern section administered the tribal areas and tributary states, while the southern section dealt with the Chinese-inhabited areas. Chinese under the Liao dynasty were ruled as a separate tribe. Because the Khitans had already begun developing their own script based on Chinese and Uighur before they completely conquered northern China, they did not sinicize as quickly or as completely as other peripheral groups. Liao emperors continued their nomadic ways, moving seasonally from one camp to another and expecting their Chinese officials to visit them wherever they happened to be at that time.

► SINICIZING THE INVADERS

The Chinese have a long history of sinicizing their enemies. Rough barbarian groups took readily to the silks and civilization of China. The Chinese government used that interest in the luxuries China had to offer to “civilize” real or potential invaders. Their methods included paying tribute in silks and other goods, marrying Chinese princesses (often servant or nonnoble women who were elevated for the purpose of the diplomatic marriages) to “barbarian” rulers, presenting foreign rulers with Chinese titles, and trade.

By creating a dependence on Chinese goods, the Chinese weakened the tribes and kingdoms along their periphery. One Turk warned of the difficulties of such dependence and cautioned his people about becoming too familiar with the Chinese:

“They [the Chinese] gave us gold, silver, and silk in abundance. The words of the Chinese people have always been sweet and the materials of the Chinese people have always been soft . . . having

heard these words, you unwise people went close to [the Chinese] and were killed in great numbers. If you go towards those places, O Turkish people, you will die; if you stay in the land of Otuken [Mother Earth—the ancestral central Asian homeland of the Turks], and send caravans from there, you will have no trouble.”

Despite the warning, the lure of China's luxury goods and civilization continued to attract peripheral groups, eventually bringing them under China's control.

Quoted from Luc Kwanten, *Imperial Nomads: A History of Central Asia, 500–1500* (Philadelphia: University of Pennsylvania Press, 1979), 29; Larry W. Moses, “T'ang Tribute Relations with the Inner Asian Barbarians,” in *Essays on T'ang Society*, ed. J. C. Perry and B. L. Smith (Leiden: Brill, 1976), 83–85.

The Liao dynasty continued its policy of indirect control, but to the northern peoples its rule seemed harsh. Tribes under Liao control frequently rebelled. One of these groups, the Jurchens of Manchuria, protested against the abusive Liao officials and the large tribute payments they were forced to make. The final insult came when the Liao emperor humiliated the Jur-chen leader by ordering him to dance. In the 1120s the Jurchens overthrew the Khitans, who had been weakened by numerous rebellions. The Jurchens took the dynastic name of Jin (gold) and ruled northern China from 1115 to 1234. Although Khitan rule had ended, its memory lived on in the name “Cathay,” a term used to indicate northern China.

Many Khitans fled the new regime, but others stayed and worked for the Jurchens, who had retained the Liao political system. Unlike the Khitans, the Jurchens were more quickly and completely sinicized, even adopting Chinese philosophy. The Jurchen emperor, like the emperor of China, titled himself a “son of heaven.” The Jurchens successfully held more of China than the Khitans, eventually ruling all of northern China. The Jurchens made greater use of Chinese advisers and officials, and a far greater percentage of the population of the Jin dynasty was Chinese. The Jurchens resettled much of their population in Chinese territory, where daily contact with Chinese broke down Jurchen traditions, which were inadequate for life in a settled society. To survive, the Jurchens became Chinese in culture and politics.

In 1142 the Jurchens signed a peace treaty with the Southern Song dynasty. Despite the treaty, the Jurchens attempted in 1161 to invade Song lands and take more territory but failed. The Khitans who remained under Jin rule revolted several times between 1161 and 1177. Some of them collaborated with Mongols who chafed under Jin administration. Some Khitans who moved westward into Central Asia to avoid Jurchen rule formed a new empire, the Qara Khitai. In 1141 they fought and defeated the Seljuk Turkish ruler, Sanjar, in Samarqand. Known as the XiLiao (Western Liao) dynasty by the Chinese, at the height of their power their empire stretched from the borders of China to the Aral Sea. It remained intact until 1234 when the West-

ern Liao fell to the Mongols after nearly 25 years of fighting.

In 990 the Tanguts, a Tibetan group, created a new kingdom in northwestern China that the Chinese knew as XiXia (Western Xia, 990–1227). Originally nomadic, the Tanguts became sedentary, settling down and building towns and numerous walled cities. The XiXia dynasty controlled the Gansu Corridor and the Ordos desert plateau, both of which lay to the northwest of the Chinese heartland, and the kingdom was rich because it controlled the trade routes that ran through these two areas. Although the dynasty entered into a treaty with the Mongols, it refused to send troops for the Mongols’ western campaigns, violating their treaty and sealing its fate. Once the Mongols defeated Khwarazm in the west, they turned on the Tangut cities and destroyed them along with the XiXia empire.

Ming Migration to Yunnan

The Ming expanded into regions that had previously not been part of China but had been part of the Mongol empire, with Yunnan in the southwest the primary region for this expansion. Yunnan only became a province of China in 1382; prior to this it had been outside of Chinese dominance, although Chinese influence had reached into the region. The Mongols conquered Yunnan in the period 1253–1254, and it served them well as a base of operations not only against the Southern Song empire but then for an unsuccessful

► NON-HAN ETHNICITIES IN YUNNAN

Prior to the Mongol conquest of Yunnan, it was known as the Kingdom of Dali, which dated back to 937, and was ruled by the Duan dynasty of Bai ethnicity, although it claimed Han ancestry in order to better relations with China. Bai people remained a considerable presence during the Ming era and occupied much of the western part of the province.

Other significant groups existed alongside the Bai, all of them speaking different languages and having distinct cultural identities. The Yi, or Lolo, dominated the central and northern parts of Yunnan during the Ming period. During the Yuan period large numbers of Muslims, often of mixed ancestry, moved into the region as part of the Mongol incorporation of Yunnan. In addition Tibetans, Dulong, and Nu people occupied other parts of the northern and western parts of Yunnan but in smaller numbers than the Yi or Bai. In the southern parts the Dai and other groups speaking Tai languages comprised the majority of the population. Due to their language they maintained close contacts with many areas of Southeast Asia. Meanwhile in the mountainous eastern regions of Yunnan, the Miao and Yao along with smaller groups coexisted but had linguistic and cultural differences.

Due to the vast ethnic, linguistic, and cultural differences among the populations of Yunnan, the Ming had a difficult time establishing their control over the region. Only with the immigration of a substantial Han population into the region could effective and permanent Chinese domination and integration into the empire occur.

—*Timothy May*

attempt at expansion into the northern regions of Southeast Asia. Because Yunnan possessed pasture land, it became an important area for Mongol garrisons. Many of the Mongols who failed to return to Mongolia after the collapse of the Yuan state were stranded in Yunnan, and with the collapse of Mongol rule the Ming inherited Yunnan. Yunnan was peculiar, as it not only possessed a Mongol population but, like much of southwest China, had an indigenous population that was largely non-Han Chinese.

Initially much of the Han, or ethnic, Chinese migration into Yunnan was motivated by a de-

sire to escape the chaos of the Red Turban Rebellion that raged from the 1340s to 1368 and eventually became the vanguard of a China-wide rebellion that drove the Mongols out of China. The movement began as the White Lotus Society, a Buddhist secret society that had a millenarian shade to it, as its members expected the imminent arrival of the Maitreya Buddha (the Buddha of the Future), a promised messiah-like figure. Gradually the movement underwent a metamorphosis into a militant rebellion that included changing head coverings from white to red, deemed a more auspicious color than white, and thus becoming known as the Red Turbans.

In the course of the Red Turbans' successful attempt to drive out the Mongols, chaos reigned in many areas until the Ming dynasty established its hegemony over China. After fears of a return of the Mongols subsided, the Hongwu Emperor (r. 1368–1398) turned his attention to dealing with the Red Turbans, of which he was a former leader. Rivalry among the Red Turbans' leadership had always been high, resulting in not all of them recognizing his rule; hence conflict ensued. Although Yunnan was not a center of Red Turban activity, it bordered Sichuan, which was a Red Turban stronghold. In the early 1370s Ming armies crushed the Red Turbans of Sichuan, and the fighting sent many additional peasants fleeing to the safety of Yunnan.

Although the Yuan dynasty fell in 1368, the Ming court did not deal with the Yunnan Mongols until 1381. The court desired not only to end any potential threat from the Mongols but also to bring the region under its administrative authority. This decision, which resulted in a 300,000-man Ming army being sent into Yunnan, marked the official beginning of Han Chinese migration to Yunnan. With the conquest of the region in 1382 Yunnan became part of the Ming empire, with the army permanently stationed there. Along with the soldiers came their wives and children, thus forming a sizable Han population but still a minority within Yunnan. The majority of the population consisted of Yi, Tibetans, and numerous Tai-speaking groups.

The Ming, like the Mongols, also sought to expand into Southeast Asia from Yunnan but with similar negative results in the early fifteenth century. Nonetheless as numerous armies entered

the area, the process cemented Yunnan to the Ming state and brought in more Han settlers. More troops also came to quell unrest and various rebellions among the non-Han peoples. It also became the Ming empire's penal colony. Political offenders (both prisoners and those who lost favor in the court) were sent to die in Yunnan, as it was thought that the climate produced miasmas that would kill anyone who spent too much time there. Over time this idea faded, and Yunnan's varied geography of mountains, lakes, and pastures attracted artists and scholars interested in studying the indigenous population. The exile of various persons to Yunnan also served strategic ends, removing many of the entrenched aristocrats' influence at court who, once in Yunnan, could serve as Ming officials.

Although there were border raids into Yunnan from Tibet and Southeast Asia, the Ming on their southern and southwestern frontiers did not face anything even approaching the dangers of raids on China's northern and northwestern frontiers. Consequently, the spread of Chinese culture and influence into Yunnan proceeded at a fairly even pace.

The Continued Dispersal of Turkic Peoples to the West

In the sixth and seventh centuries, various Turkic groups moved westward out of the Mongolian plateau as part of the Gok Turk empire or as a result of being displaced by the Gok Turks. The majority remained in the steppes north of the Caspian and Aral seas. Others, however, migrated southward into Central Asia and the Middle East, resulting in the eventual Turkification of some areas, such as Anatolia, or in military domination of regions where non-Turkic peoples remained the majority.

➤ TURKIFICATION OF ANATOLIA

The Turkification of Anatolia began with Seljuk penetration of Anatolia in the eleventh century. In 1071, Sultan Alp Arslan's (r. 1063–1071) victory at Manzikert not only crushed a sizable Byzantine army but also stripped the Byzantine empire of the central Anatolian lands, which up to that point had provided the Byzantine army with a large number of troops and taxes. Still, the Seljuks considered Anatolia an afterthought, although it eventually emerged as an independent state, known as the Sultanate of Rum (Rome). Other Turkic groups also continued to move into the region. As late as the early thirteenth century, however, most of the inhabitants of central Anatolia remained Greek and Christian, even though the Seljuks of Rum controlled the interior. The Turkification and Islamization of Anatolia gained momentum during the period of Mongol expansion, as numerous Muslim scholars, Sufis, and nomads fled from Iran, Iraq, and other eastern Muslim regions to Anatolia. The nomads were encouraged to move to the frontier to search for pasture, while the others settled in the cities. The syncretic form of Islam preached by Sufis found adherents not only among the nomads but also among the Christian peasants. Over time, the sedentary population acquired many of the practices and customs of the nomads, and a syncretic culture emerged that blended the Turkic and Greek elements together. In the Islamic world, Anatolia increasingly became known as *bilad al-Turkiyya*, or the land of the Turks, from which the name "Turkey" is derived.

—Timothy May

Turks gradually entered the Middle East as mercenaries and even more so as military slaves (mamluks) in the eighth and ninth centuries, but the major Turkish influx into the Middle East occurred in the eleventh century with the arrival of the Seljuk Turks, a branch of the Oghuz Turks who had been nomads in the region of present-day Kazakhstan. As they filtered south across the Amu Darya River, they slowly converted to Islam. In what started as a quest for pasture, the Seljuks soon established an empire by dominating much of Iran in the mid-eleventh century. Their leader, Tughril Beg (ca. 990–1063), found legitimization for Seljuk expansion and dominance by liberating

Baghdad and the Abbasid caliph from Shia domination in 1055 and was rewarded with the title of sultan (“the possessor of temporal power”).

As the Seljuks settled down to rule their empire, other Oghuz groups also entered the Middle East throughout the course of the eleventh and twelfth centuries. Realizing the potentially destructive encounters between the new, still nomadic Turks and the sedentary Iranian peasantry, the Seljuks encouraged and forced the newcomers to continue their westward path. Indeed, the majority of the western part of the Seljuk domains in Syria and Anatolia were conquered by these nomads, some recently converted to Islam. As such, they were viewed as *ghazis*, or warriors of the faith, although their zeal may have been fueled as much by glory, gold, and girls as much as God. Nonetheless, it legitimated the Seljuks as Defenders of the Faith. In return for the western pastures and the freedom to pillage and plunder on the borders, the nomads recognized the Seljuks as their overlords, even if it was only nominal recognition. Still, to an outsider all of the Turks appeared to be Seljuks. Furthermore, the military dominance of the Seljuks and the other Turkic nomads helped solidify the Turks as the ruling warrior class in Southwest Asia, the so-called Middle East. Ultimately, fratricidal struggles over succession to the sultan’s throne routinely fractured any unity within the empire. Indeed, by 1157, the empire ceased to exist in any practical form, although remnants and successor states emerged and ruled much-reduced territories.

While the Oghuz Turks penetrated the Middle East, another Turkic branch continued westward. In the tenth century, the Pechenegs settled in the Pontic steppes above the Black Sea in present-day Ukraine and Russia. While pastoral nomads had dwelled in the region for centuries, the Pechenegs are the first clear Turkic group, as others tended to be of mixed ethnicities ranging from Iranian, Turkic, and perhaps even some Mongolian at different periods. The Pechenegs dominated the western end of the Eurasian steppe and interacted with the East Slavs in the nascent Kievan state in Russia.

In the mid-eleventh century a new group, known alternately as Polovtsy, Cumans, and Kip-

chak depending on the source, entered the steppe. The Kipchaks cemented the Turkic identity of the Pontic and Caspian steppes. Indeed, they spread Turkic culture and customs into the Rus principalities as they formed alliances, married, traded, and engaged in military activities with the Rus. Even the Mongol onslaught in the thirteenth century could not change the Turkic identity of the steppe. The Golden Horde, the Mongol state that dominated the Black Sea and Caspian Sea states, ultimately adopted Kipchak Turkic as its primary language, a reasonable move since most of the population was Turkic.

The Continuing Drang nach dem Osten—Western European Colonists Move Eastward

The drive for west-central Europeans to move east, known as the Drang nach dem Osten (drive to the east), contributed to the resettlement of more than 300,000 migrants during the High Middle Ages (ca. 1050–1350). Peasants, merchants, lords, and clergy left overpopulated regions in search of farmland, commercial interests, military power, and religious converts for new lands in central and eastern Europe.

Rapid population growth in the western regions of Europe required agricultural expansion. The large-scale migration of peasants to eastern territories began as early as the ninth century and continued well into the fourteenth century. Flemish, Danes, Saxons, and other Germanic speakers moved east of the Elbe River to Polish and Baltic regions to drain lowlands, clear farmland, and cultivate grain crops. Miners, smelters, and artisans from Swabia, Flanders, and Lower Saxony moved to silver and copper mines in Bohemia, southern Poland, and Transylvania.

Merchants, searching for new commercial markets and goods, moved to newly established cities in the east such as Riga. They expanded the northern European trade network and increased the economic power of the Hanseatic League in particular as they exported Baltic grain crops to the Netherlands, England, and France and imported Flemish cloth.

People also moved to eastern Europe for religious and political reasons. During the twelfth and fifteenth centuries knightly crusading orders, such as the Sword Brothers and Teutonic Knights, following a sense of divine mission and the appeals of Slavic rulers for protection against opposing neighbors, conquered territory from ethnic Prussians, Lithuanians, and Livonians during the Baltic Crusades. Germanic, Swedish, Danish, and Polish princes used this crusade to convert perceived heathens to Christianity and to expand their political realms eastward. To solidify their power and increase revenue, conquering lords hired recruiters to attract and settle migrants in their new domain. The Teutonic Knights maintained military control in the Baltic until their defeat at the Battle of Tannenberg in 1410 by an allied force led by King Władysław Jagiello of Poland.

Latin Christian missionary monks and bishops, long interested in preventing the Orthodox Church of Constantinople and its Russian affiliate from expanding farther into Slavic and Baltic regions, also saw the crusades as an opportunity to more aggressively convert the local populations and to end pagan practices in the area. Polish and Baltic leaders quickly converted to Latin Christianity and encouraged their subjects to do likewise.

The resettlement of so many people had an impact upon identity and ethnic formation. Although migrant groups in Transylvania established closed and ethnically homogeneous settlements, the majority of West-Central Europeans who moved to the rural regions integrated with local inhabitants. By contrast, urban centers such as Riga became ethnically heterogeneous as foreign merchants and lords interacted but did not necessarily mix with the local elite and residents. Merchants and artisans from west and central Europe also brought with them political

THE STATUS OF IMMIGRANT PEASANTS

Peasants who participated in the move to lands east of the Elbe River arrived as part of an organized effort to Christianize pagan Slavs. German lords and clergy, such as Frederick, archbishop of Hamburg and Bremen, attracted peasants to several colonies in Poland and the Baltic region by promising certain privileges. Peasants still had to pay tributes and tithe and had to obey canon law and their bishop. Yet they were free, owned land, regulated secular matters through their own courts, and established their own Catholic churches wherever they wished. Consequently, peasants, who hoped to escape serfdom in their homeland, willingly resettled east, at times traveling in wagon trains.

—Petra DeWitt

and commercial practices based on German customs and thus contributed to German becoming the language of trade in the Baltic region.

The Great Plague and poor harvests during the fourteenth century ended the medieval *Drang nach dem Osten*; however, the drive to move east remained a constant in the minds of west-central Europeans. Merchants expanded their trade activities into Euro-Asian commercial networks, Jews and Mennonites looked toward Poland and Russia as they escaped religious persecution in west-central Europe, and Germans for generations viewed the Euro-Asian borderland as a *Lebensraum* (living space).

Folk Migrations in Mesoamerica— Toltecs and Nahuas

The migrations of the Toltecs and of the Nahuas (Mexica) are distinct and in many ways opposite while complementary. The older of the two is the Toltec people. The Toltecs inhabited the large and powerful city of Tollan, identified by most modern scholars as Tula, Hidalgo. Their civilization was the fusion of two cultural groups that arrived sometime before 900 CE and merged with various indigenous peoples. One, related to the Nahuas, came from the northwest, having developed in the fertile riverine region known as the Bajío, the region drained by the Lerma River. The other group came up from the tropical lowlands of the Gulf Coast, a region known as the Huasteca, mostly along the Pánuco River. In Tula these two groups created a civilization that would influence all of Mesoamerica.

During their Post-Classic period (ca. 950–1150), the Toltecs used the techniques of irrigation, practiced long-distance trade, and developed the fine and practical arts. They gained renown as artisans. They had a powerful central government and worshiped the major gods of the Mesoamerican pantheon. Their agricultural and artisanal success allowed them to expand far beyond their capital, mostly by virtue of trade networks that stretched far into southern Mexico

and possibly up into the U.S. Southwest. Yet the success was relatively short-lived. Around 1150 during the reign of the legendary Topiltzin Quetzalcoatl, Tula was wracked by civil war and also was attacked by nomadic tribesmen from the far north collectively known as the Chichimeca. The opponents were led by the also legendary Huemac. Topiltzin Quetzalcoatl was forced to abdicate and was either sacrificed or fled. The result was that there was a diaspora of Toltecs, mostly to the south and southeast. Some migrated to the not-too-distant Valley of Mexico. Others followed routes of trade and conquest and occupied part of the Yucatán lowlands in the Mayan city known as Chichen Itza. Still others fled to sister cities nearby such as Tulancingo (New Tollan) and Cholula. These fleeing Toltecs carried with them both the imperial aura of their fallen city and the technologies developed there. As a result, they came to found highly honored dynasties in the cities that accepted them. In the Valley of Mexico, for example, both the Acolhuas of Texcoco and the Culhuas of Culhuacan claimed descent from the Toltecs. Thus, the Toltec migration was a diaspora from Tollan throughout Mesoamerica.

The Aztecs, also known as the Mexica, began a long migration of their own shortly before the fall of Tula. According to their legends, they began in the city of Aztlan (hence, Aztecs), located in a lake. They migrated for several generations, passing through several confrontations with other tribes and with their gods, always led on by their tribal god, Huitzilopochtli (Hummingbird on the Left). Scholars have concluded that the migration legends of the Mexica indicate that they started in the northwestern regions of modern Mexico and slowly migrated toward the Valley of Mexico. As such, they were one of many nomadic peoples who made up the Chichimecas, who moved from the north when climatic conditions began to make the region more arid, into the better-watered central zones. Eventually in the thirteenth century, they entered the Valley of Mexico.

The Valley of Mexico was already fairly densely populated and home to at least three major cities. The Mexica gained permission to settle near a rocky outcropping on the western shore of the central lake, Lake Texcoco, in a place

➤ LEGEND OF THE EAGLE AND THE SNAKE

Popular legend has it that the omen that the Mexica saw when they founded their city was an eagle perched on a cactus with a serpent in its mouth. This image is found on the Mexican national flag and on Mexican currency and is closely identified with the Mexican nation. Nevertheless, the snake is a new addition. Originally there was no snake, only the eagle and cactus. In all likelihood, someone mistook a scroll near the bird's mouth for a snake. The symbolism of the image is important. The eagle was a representation of Huitzilopochtli. The cactus was important for its fruit, the prickly pear, which was a symbol for a human heart. Thus, the eagle on the cactus represented human sacrifice to Huitzilopochtli.

—John F. Schwaller

Frontispiece from the Codex Mendoza, about 1540. According to legend, Huitzilopochtli, the Aztec war god, told the Aztec people that a divine sign would guide them to their new homeland. After hundreds of years of wandering, the Aztec came into the Valley of Mexico and found the sign—an eagle perched atop a cactus. (Bridge-man Art Library)

called Chapultepec. They gained support from several of the local city-states and began to intermarry. They adopted the agricultural methods used in the valley, including reclaiming land through the *chinampa* system of “floating gardens.” Moreover, they proved to be strong warriors and assisted the Culhuas in their wars with other valley cities. By the early fourteenth century the Mexica had gained enough status to be recognized by the powerful Culhua empire of the southwestern corner of the Valley. Yet when a Mexica prince married a Culhua princess, the

Mexica sacrificed her to the god of regeneration and springtime, Xipe Totec. This infuriated the Culhuas, who attacked the Mexica and drove them from Chapultepec into Lake Texcoco. There the Mexica took refuge on two low-lying mudflats, where they saw an eagle perch on a cactus, an omen that this was where they should found their city and cease their migrations. Traditionally this has been dated as 1325 CE.

Folk Migrations in South America and the Caribbean—Caribs, Arawaks, Chibchas, and Tupi

When Columbus landed in the Caribbean during his second voyage, he encountered two main ethnic groups, Tainos, who belonged to the Arawak linguistic family, and the Caribs. The Tainos described the Caribs as savage, cannibalistic intruders to their lands. The Caribs are most often described as a migrant group originating in the Brazilian Amazon and spreading throughout the Lesser Antilles. However, the real origin for this group of islanders is shrouded in mystery that archaeological, ethnohistorical, and linguistic evidence has not yet resolved.

European colonists documented several versions of a Carib migration myth. One myth of the Dominica Island Caribs was recorded in the 1600s and tells the journey of Kalinago, the ancestor of all Caribs, and his family from the shores of the Guianas. The myth also tells of the conquest of the Caribbean Arawaks, who also originated in South America. Another myth from St. Vincent tells the story of the Caribs living in what are today the Guianas. They were under Arawak rule, fought against them, and fled to the islands. In this myth, no groups of people were

➤ WERE THE CARIBS CANNIBALS?

When Christopher Columbus landed in the Bahamas in 1492, he befriended a group of Taino villagers. Months later Columbus would sail to the island of Hispaniola after Taino warnings of cannibalistic activities on both this island and Cuba. Carib cannibalism has maintained a mythical status, but its truth is still debated by scholars.

According to Columbus, although not welcomed with the enthusiasm of the Taino, the Caribs of Hispaniola were generous once he told them that the Spaniards were Christian. Columbus's Bahamian guides, however, would not even walk on the deck of the ship for fear of the Carib practice. Columbus soon believed that *canibas* and *caribas* were actually stylized labels for *Khan-ibas*, those under the rule of the Grand Khan. Columbus still thought that he was on the right track to the Indies and discounted the Tainos' worries. Indeed, firsthand accounts of cannibalistic activities are scarce, and some researchers conclude that later Europeans exaggerated the use of this practice to justify slave raiding. Others

conclude that the Tainos gave Columbus false information to prevent loss of trade to their islands or to persuade Columbus to land on an island closer to their home.

However, the close relationship between the Caribs and populations in South America may lend support for cannibalistic activities in the Caribbean. Anthropologists have found cannibalism to be extensive throughout the South American lowlands. In addition, both Father Bartolomé de Las Casas (ca.1484–1566) and Father Raymond Breton (1609–1679) recorded cannibalism as part of Carib culture. The priests did not have any reason to lie about their observations and were the most reliable ethnographers for the Caribbean populations of the sixteenth and seventeenth centuries. It is unknown whether these instances of cannibalism were nutritional or symbolic.

It appears that although Carib cannibalism is still debated, evidence may support its reality in both the precontact and postcontact Caribbean.

—Melissa Sue Halverson

previously living in the islands. The third myth tells the story of the Caribs stealing the Caribbean Islands from the Guianas Galibis tribe. A German explorer writes that the Caribs originated in the Parana River valley of Argentina with subsequent conquest of northern South America and the Caribbean. The details of the myths are not as important as the one binding tale: a migration from South America to the islands.

The archaeology of the Carib migration is difficult to interpret. The Carib islanders used ceramics defined as the Suazoid series. This pottery has been dated to 1100 CE and forms a complete break with the preceding Saladoid series. However, archaeological evidence supporting similar ceramic styles in South America (and hence the migration) is scant. Indeed, the ceramic series attributed to the Caribs is unique to the Lesser Antilles and is found in greatest quantity in Barbados, an island on which a Carib occupation is not reported. In addition, self-identified Caribs of what is today Saint Kitts used post-Saladoid but not Suazoid ceramics. However, historic Carib ceramics are similar in

appearance and style to Carib pottery from the Guianas. Why aren't Suazoid Carib ceramics similar to historic Carib ceramics?

When evaluating the ethnohistorical and linguistic knowledge, the truth concerning Carib origins is still muddled. A seventeenth-century Carib dictionary tells us that the Island Caribs at the time of European contact called themselves Kalinago. This evidence supports their origin myths because the tribes in Surinam and the Guianas call themselves the Kalina. The Island Caribs were unique in having three separate spoken languages: one spoken by men, one by women, and one used for special occasions. The women's language is clearly Arawakan in origin, probably due to the fact that so many of them were captives. This language is similar to that of the Caribbean Tainos and other Arawak peoples from Venezuela. It is thought that the Carib language split from this original language around 1000 BCE. The women's language still owes 22 percent of its vocabulary to mainland Kalina, with the men's language similar but with a higher percentage of Kalina words.

Experts have evaluated this evidence but disagree on its message. Allaire believes that the Island Caribs either migrated much later than originally thought or that the Island Caribs acculturated with the mainland tribes through intensive trade. He favors the acculturation hypothesis, however, because it supports the archaeological evidence. Davis and Goodwin believe that the Island Caribs were actually Arawaks with a long Caribbean occupation whose cultural and linguistic similarities to South American groups formed after the evolution of intensive trade, raiding, alliance, intermarriage, and gift exchange with the region. Taylor argues that the Kalina vocabulary in the men's Carib language supports a migration from South America. Taylor and Hoff argue that the men's Carib language is actually a form of pidgin that assisted in inter-island trade and communication. This hypothesis argues against Allaire's recent migration model. Researchers are still debating Carib origins, with the hope that future archaeological work both in the islands and in South America will contribute to their knowledge.

Folk Migrations in North America—Muskogeans, Iroquois, Algonquians, Sioux, and Athabascans

A rich archaeological record and oral traditions help archaeologists and cultural anthropologists to reconstruct the diverse folk migrations of the influential Muskogeans, Iroquois, Algonquians, Sioux, and Athabascan nations who occupied large portions of the present United States and Canada prior to the arrival of European immigrants. Such migrations allowed them to make optimum environmental adaptations, establish and maintain elaborate trade networks, and adjust to changing social and political conditions associated with intertribal warfare.

The Muskogee, or Creek, Indians were a powerful confederation of tribes who lived in central and northern Georgia, Alabama, and Florida. They first reached the Southeast via the Red River, whereupon they killed, displaced, or assimilated into the early mound building culture that occupied Georgia. Scholars indicate that they may have traveled from the eastern Rockies between 800 and 1000 CE. As a result of large populations and food scarcity, the Creek migrations continued, and they established numerous towns along the rivers and creeks connecting with the eastern branches of the Mississippi. After crossing the Mississippi around the confluence of the Ohio, they expanded their influence and soon thereafter began entering into diverse trading alliances with English, French, and Spanish colonists. In Charleston, South Carolina, the Lower Creek Indians from the Chattahoochee River established trade with the English as early as 1670. More formal agreements followed in the wake of the Yamassee War of 1715 and then again in 1733 and 1739 with the signing of the Treaty of Coweta in which the Creeks ceded land to Georgia.

The Northern Iroquois also established a powerful alliance called the Iroquoian Confederacy between 1400 and 1600. This included the five nations of New York: Mohawk, Oneida, Onondaga, Cayuga, and Seneca. It was once believed

WHAT ARE TODAY'S ATHABASCAN LANGUAGES?

Speakers of the Athabascan (Na-Dene) language family live in diverse geographic areas ranging from Alaska and northwestern Canada to southern Oregon, northern California, the U.S. Southwest, and northern Mexico. This language family is comprised of the Northern, Pacific Coastal, and Southern Athabascan branches. Today, the largest number of native speakers exists among the Navajo (Diné), who report an estimated 150,000 native speakers. Among this group are the famous U.S. Marine Corps code talkers of World War II. Within the Southwest, more than 15,000 people continue to speak Apachean languages. Athabascan languages are resilient in British Columbia as well where Carrier (2,000), Chilcotin (1,200), Babine-Witsuwit'en (500), Kaska (500), and Sekani (100) are spoken. In the Northwest Territories, Chipewyan (4,000), Dogrib (2,500), Slavey (2,500), and Gwich'in (700) are among the official languages. Smaller numbers of people speak Tutchone (400), Beaver (300), and Upper and Lower Tanana (130). Only a handful continues to speak Hupa, Tolowa, and Tututni of the Pacific Coastal branch. Similar risks are posed to the Han, Holikachuk, Koyukon, Tanacross, Upper Kuskokwim, Tanaina, and Ahtna languages.

—Alex K. Carroll

that the Saint Lawrence Iroquoians were ancestral to the Oneida or Onondaga Iroquois of the Northeast; however, these theories have since been proven untrue. Today archaeological evidence shows that each of the original five nations developed in the areas they occupied in historic times rather than arriving via long-distance migrations.

By contrast, many of the Algonquian groups carried out significant migrations. The Central Algonquians include the Ojibwas or Chippewas, Potawatomis and Ottawas, Illinois, and Miamis. The Ojibwas, also known as the Anishinabe or “original people,” migrated to Lake Superior from east of Montreal between 1000 and 1400 CE. Within oral narratives, Madeline Island of the Apostle Islands and the mouth of the St. Lawrence River are revered as the originating places. At Mackinac Island in Lake Huron southeast of

Sault Ste. Marie, the Three Fires, which includes the Ojibwas, Potawatomis, and Ottawas, split. The Ottawas moved to the northern shores of Lake Huron, the Potawatomis traveled to Michigan, and the Ojibwas journeyed to the southern shores of Lake Superior.

Tensions over land and resources sometimes resulted in intertribal conflicts between the Anishinabe and the neighboring Sioux, who underwent many migrations before settling into Wisconsin and Minnesota. Their first homeland comprised parts of Ohio, Illinois, Kentucky, and possibly Tennessee. From the Green River in Kentucky the Late Archaic period Sioux (3000–1000 BCE), described by archaeologists as the Indian Knoll Culture, migrated in many directions, following the rivers as well as the Allegheny Mountains and waterways of the Atlantic seaboard. They migrated through portions of Kentucky, Tennessee, Alabama, North Carolina, South Carolina, Virginia, Ohio, Indiana, and Illinois. Next, the Sioux established themselves in Wisconsin and Minnesota, developing the Effigy Mound Culture by 700 CE. They were profoundly influenced by people from the South whom archaeologists call the Hopewell Culture, which terminated around 1300. Under this influence, they established themselves within the Ohio Valley and maintained extensive trade routes along the Mississippi, which the Europeans noted at first contact. The Sioux remained in the woodlands until the late 1700s, whereupon they relocated to the Great Plains.

The Athabascans made large migrations before settling into the areas where they were found at the time of first European contact. Approximately 2,000 years ago, Athabascans began migrating from southern Alaska. In multiple migrations they journeyed east across Canada, down the northern California coast, through the Southwest, and into northern Mexico. The Diné (Navajo) migrated from western Canada to the Southwest around 1350 CE. Following the occupation of the traditional lands of the Paiute and Hopi of the Colorado Plateau, they began to engage the Pueblo villages in trade. The Apaches continued their migrations, settling in portions of Arizona, New Mexico, Texas, and Oklahoma around 1500.

The Peopling of Aotearoa (New Zealand)

New Zealand was the last settled archipelago in Polynesia and the last substantial landmass to be colonized by prehistoric peoples. Its cultural history of about 800 years and remarkable isolation provide a detailed record of human adaptation and human impact on pristine natural environments. Aotearoa (“the long white cloud” to the native Maoris) differs from other Polynesian islands in its substantial landmass, temperate rather than tropical climate, and great regional diversity in natural resources. Consequently, New Zealand provides a wonderful case study of how isolation and environment affect cultural change.

Linguistic and archaeological evidence indicate that New Zealand was settled from the core of central Eastern Polynesia, but the exact time of human colonization has been sharply debated, and consensus has yet to be reached. Early theories privileged Maori legends and genealogies and argued for the arrival of Kupe in 950 CE, Toi in 1150 CE (both are culture heroes), and the Great Fleet in 1350 CE. The Great Fleet was described as a single great migration of canoes from a homeland known as Hawaiki. Analysis has since debunked this theory of the Great Fleet as flawed, both on historical and archaeological grounds.

Linguistic models demonstrate that New Zealand Maori is related to both Tahitian and Rarotongan and support the notion that Aotearoa was settled from central Eastern Polynesia. Ar-

➤ KUPE'S WIFE SIGHTS AOTEAROA

According to Maori legend, before Kupe set off in a pursuit of the giant octopus Te Wheke, who was causing the fishermen of Hawaiki great problems, his wife Hine-i-te-aparangi warned him not to leave because she had dreamt that he would die on the voyage. Enraged that she tried to keep him from his duty, he ordered her and his children to accompany him. As they sailed south in his *waka*, it was she who first sighted new land, crying out “He ao! He ao! (A cloud! A cloud!).”

—Alfred J. Andrea

chaeological data indicate that coastal areas of North Island and South Island were settled by 1200 CE. The initial discovery of New Zealand may predate this, but human-induced landscape changes, suggesting deliberate forest clearance with fire (typical of early settlement sites in Polynesia), similarly date to around 1200 CE. While some argue that bones of the Polynesian rat, which was introduced to New Zealand by humans, may be as much as 2,000 years old, the accuracy of these dates is still disputed.

DNA evidence from New Zealand rat populations, however, indicates that multiple voyages were involved in the initial settlement of New Zealand, while DNA data for human skeletal populations suggest that a minimum number of 70–190 women arrived in the first voyages settling New Zealand. Unlike other islands in Eastern Polynesia, pigs and chicken were never introduced to New Zealand; perhaps they simply did not survive the initial colonization voyage.

These first colonists must have been astounded by the size of New Zealand, the diversity of its forests, and the “naive” fauna (animals with no fear of humans). The latter included huge flightless birds (*moa*), which had lost the ability to fly in this isolated environment that lacked terrestrial predators up to the time humans arrived. The colonists, however, would have been challenged by the temperate environment. The absence of banana, breadfruit, and coconut—staples in other Eastern Polynesia societies—was simply due to the fact that New Zealand was too cold to support these tropical crops. However,

fish, shellfish, and seals were abundant in coastal areas, and a plethora of bird species was found throughout.

The great regional diversity in New Zealand's natural resources did not allow for a single type of subsistence lifestyle to be practiced across the region. New Zealand's natural resources are particularly well suited to hunter-gathering, and the initial colonists, who were agriculturalists, adapted accordingly.

Groups settling the middle to southern reaches of South Island, outside of the zone in which crops could be grown, gave up their agricultural way of life and became hunter-gatherers, specializing in the collection of the rich maritime resources (seals, fish, shellfish) and extensive hunting of native birds. The native moa populations were nearly hunted to extinction a few centuries after initial human settlement. By about 1500 they were virtually extinct, although small remnants might have survived for more than a century before they fully vanished. With their demise came the shift in South Island from permanent settlements focused on moa hunting to a more transient settlement pattern associated with a broader hunter-gathering subsistence. After about 1500 CE, fowling of smaller native birds was a specialized subsistence activity, while the fishing and hunting of marine mammals continued.

Those introduced crops that could grow were cultivated in the milder climatic regions of North Island and only in the northern part of South Island. These included the sweet potato, a South American domesticated plant that was introduced prehistorically into Eastern Polynesia. Sweet potato is tolerant of temperate climates and overwinter storage and became the principal crop in those regions of New Zealand where agriculture was a viable option.

Horticulture was an important part of subsistence from the early colonization period onward. On North Island, sweet potato cultivation and storage were intensive and extensive and associated with diverse forms of storage pits. Fortified villages, known as *pa*, were constructed on the North Island landscape initially between 1300 and 1500. They include well-defended sites with ditches and palisades, which at times enclosed storage pits. This suggests that warfare and com-

petition for resources had escalated because of the sizable Maori population on North Island in later prehistory.

Moving Sugar Plantation Laborers to the Atlantic Islands

During the late fifteenth and early sixteenth centuries, large numbers of African slaves were taken from their homes to work on sugar plantations on Atlantic islands controlled by the Portuguese. Traders learned that they could tap into an existing slave trade network to obtain the many laborers needed to produce sugar profitably. This pattern became the model for later slave trading that sent an estimated 12.5 million Africans to work in the Americas over the next three centuries.

During the 1430s, Portuguese expeditions continued to explore the Atlantic coast of Africa and the nearby waters. They may have discovered the Canary Islands as early as 1336, but the inhabitants there fiercely defended themselves. A number of other uninhabited islands were discovered, including the Azores, the Cape Verde Islands, São Tomé, and Madeira. Portuguese settlers gradually colonized the islands but found that most European plants were not suited to cultivation there. However, they found that sugar grew well and had a ready market in Europe. In 1420, Prince Henry of Portugal imported sugarcane plantings as well as experts from Sicily to help establish sugar plantations on the Atlantic islands. Following the model developed in the Mediterranean, the Portuguese established sugar plantations with large units of land and equipment to refine the sugar. However, one key element—plentiful labor—was missing.

Few Portuguese were willing to migrate to the Atlantic islands, so landowners turned to slaves. Slavery had existed in Iberia on a small scale since antiquity, and the Portuguese conquest

of Ceuta in 1415 allowed merchants to participate in the existing North African slave trade. Slavery was legitimated by Pope Nicholas V in the papal bull *Dum Diversas*, issued on June 18, 1452. The bull authorized King Alfonso V of Portugal to reduce any non-Christians whom Portuguese explorers encountered to perpetual slavery. Later popes reaffirmed that nonbelievers, particularly Muslims, were to be enslaved.

At first, Portuguese explorers working their way down Africa's west coast tried to take slaves and other goods by force, but indigenous resistance made this unprofitable. By the middle of the fifteenth century, the Portuguese recognized that they instead could rely on existing trade networks in Africa. The slave trade was well developed in Africa, with caravans bringing enslaved people to coastal centers in present-day Ghana, Togo, Benin, and Nigeria. Later, many slaves were obtained from the Congo region. The Portuguese brought trade goods, including copper, cloth, firearms, gunpowder, liquor, horses, and salt. In exchange, they received slaves from African traders. The system was agreeable to both sides. African rulers did not want Europeans traveling inland, while Europeans often had fallen victim to the many diseases found farther inland.

By the end of the fifteenth century, a well-regulated trade system provided small numbers of African slaves to the Atlantic sugar plantations. Trading forts were established along the African coast. São Jorge de Mina (present-day Elmina, Ghana) was the first such fort and provided the model for others. Although fortified, they rarely were attacked since the Africans found peaceful trade more profitable. Slaves and African products were gathered at the forts for shipment to the islands or to Portugal, and goods from Europe were stored there until needed for trade. Caravels were often assigned to each fort to carry trade to and from the regional markets. An average caravel could carry up to 250 slaves on each trip between a trading fort and African trading centers. For short trips, such as from São Tomé to the African coast, the caravels could make up to four trips in one year.

Between 1450 and 1500, approximately 500 African slaves were annually exported to the sugar plantations on the Atlantic islands. Although

➤ THE SUGAR PLANTATIONS OF SÃO TOMÉ

In the early sixteenth century, São Tomé, an island off the coast of West Africa, which the Portuguese colonized during the last decade of the fifteenth century, became a center of European sugar production. Its equatorial climate, fertile volcanic soil, and abundant water supply made the island exceedingly suitable for sugarcane. The greatest need was a supply of cheap labor. Significantly, although the last of the Atlantic islands to be colonized by the Portuguese, São Tomé became the first place in the Atlantic world where sugar was primarily produced by African slave labor. Inasmuch as the African kingdoms of Kongo and Benin were only several hundred miles to the east (and the king of Kongo had adopted Latin Christianity from the Portuguese in 1491), captives were fairly easily obtained from these African states. Approximately 2,000 slaves worked the island's plantations during the early 1500s. As a result, São Tomé, more than the Canaries and Madeira, which produced far more sugar, became the model of the slave-based sugar plantation that was later brought to Brazil. São Tomé was also well known as a collection point for slaves being sent to other Portuguese possessions.

—Timothy J. Watts

small by comparison to the millions that followed, this period set the model followed for the next three centuries.

Forced Migration under Inca Rule

The Inca empire was plagued by revolts and uprisings, which endangered the survival of the state and its production of wealth. Consequently,

➤ PACHACUTI'S MITIMAES

The Basque-Galician mariner, explorer, humanist, and historian Pedro Sarmiento de Gamboa (1532–1592) wrote probably the fullest and best account of the history of the Incas and the cultures of the Andean peoples. In the following selection, he describes how Pachacuti Inca (also known as Pachacutec, r. ca. 1438–1471) created a system of forced migration in order to maintain peace in his newly carved-out empire.

“[Inca] Pachacuti then ordered others to go to the same provinces and, together with the *tucuricos* (provincial governors), take some young men and their wives from each town. This done, they brought couples to Cuzco from all the provinces, thirty from one and one hundred from another, more or less according to the size of each town. When these chosen couples appeared before the Inca, he ordered that they be taken to settle in different regions. Those who were from Chinchaysuyu were to be settled in Antisuyu, and those from Cuntisuyu in Collasuyu, so far from their

native lands that they could not communicate with their relatives or countrymen. He ordered that they be settled in valleys similar to those of their native birth, and that they take seeds from their land so that they could sustain themselves and not perish, giving them abundant lands to sow after taking them [away] from the natives of that place.

The Inca called these people *mitimaes*, which means “transposed” or “moved.” He ordered them to learn the language of the natives where they were settled and not to forget the general language, which was the Quechua language that the Inca had commanded all should learn and know in all the provinces that he had conquered.”

—Gordon McEwan

the emperor took steps not only to suppress rebellions but also to forestall their occurrence. One of the principal tools used by the Inca for consolidating the empire and ensuring domestic tranquility was a technique of social engineering that involved transplanting groups of people referred to as *mitimaes*. Throughout its short life of only 50–80 years, the empire moved hundreds of thousands of people from their homes to distant parts of the realm through forced migration.

The Spanish Jesuit chronicler Bernabé Cobo (1582–1657) relates that one of the first things that the Inca ruler did after conquering a province was to remove several thousand families from the conquered population and move them to another part of the empire where they were surrounded by people who had been under Inca rule longer and were more loyal. At the same time, these transplanted families were replaced in their recently conquered homeland by people brought from distant regions that were known to be loyal to the empire. Thus strangers were

introduced into the midst of a potentially rebellious population, disrupting cultural cohesion and traditional power networks and potentially acting as spies for the government. The other side of the coin was the introduction of recently conquered people into a larger, culturally different population of proven loyalty that could keep them under surveillance.

Great care was taken by the rulers to make sure that the peoples transferred about as *mitimaes* were sent to lands of equivalent quality and in similar environmental zones. The object was to maintain the health and productivity of the *mitimaes*. People removed from their communities in this manner were relieved of their obligations to their native rulers and became subjects of the lords in the lands to which they were taken. Once they arrived they were given land to farm and materials with which to build their houses, and they became permanent residents of the lands to which they had been moved. They were ordered to adopt the local customs and culture of the peoples native to the lands

to which they had been moved with one important exception: they were required to retain their distinctive dress and headgear so that they could be easily distinguished from the natives of the lands by the Inca rulers.

The distances over which the *mitimaes* were moved were often enormous. Peoples native to what is now Bolivia were resettled thousands of miles away in what is now Ecuador at the opposite end of the empire. Cobo noted that so many people were relocated during the reign of the Incas that there was hardly a valley in Peru that did not have at least a small population of foreign native groups.

An additional use for *mitimaes* was to place them in Inca administrative centers throughout the empire, where they functioned as a military garrison. In addition to farming to support themselves, they were responsible for enforcing decrees of the local Inca governor and defending imperial installations. These obligations were passed through the generations from parents to children in perpetuity.

Mitimaes were also used to even out the distribution of population within the Inca empire. People in densely populated areas were uprooted and forced to migrate to sparsely populated lands. Friction due to competition for resources could be eliminated by arbitrarily removing part of the population and thus lowering population density. This also had the desirable effect of evening out agricultural production throughout the em-

pire because no good lands would lack people to work them.

Another motive for moving *mitimaes* was to satisfy the individual whim of the Inca ruling elite. Communities could be moved to work on particular state projects or estates. There was also desire on the part of the Inca rulers to collect and concentrate the best artisans at their capital of Cuzco. Thus the famed metal smiths and artisans of the Chimu culture were carried off from the northern coast of Peru to the Inca capital, although without regard in this instance for the drastic difference in climate between the coast and sierra.

■ Introduction: The Vicissitudes of Avenues for Exchange—Caravan Routes and Sea Lanes

Humans have followed well-known pathways and waterways and, as well, blazed new trails and established fresh sea routes since time immemorial. During the period 1000–1500, large numbers of traditional routes that had existed for at least several millennia continued to flourish, other routes shut down or shifted due to environmental or political-military realities, and a significant number of new routes opened up as a result of a wide variety of factors.

The so-called Silk Road is a case in point of how old routes underwent challenges and changes. Well before the year 1000, Japan had been added as the easternmost terminus of the Silk Road. To be sure, although Baltic amber, furs, and slaves had been traded along the pathways of the Silk Road well before that same symbolic year, around the turn of the millennium Russia and Scandinavia became full Silk Road partners in the far northwest, thereby integrating

more completely the Baltic Sea region into this complex network. While new cultures were being tied into the Silk Road, the traditional cross-Eurasian routes that followed the oasis towns that skirted the northern and southern fringes of the Taklamakan desert became less important as avenues of interchange between (very roughly) 1000 and 1250. Merchants, pilgrims, diplomats, missionaries, and many others still trekked the many different portions of the Silk Road during these two and a half centuries, but sea-lanes from Japan to Africa and everywhere in between became increasingly important and well-trafficked routes for commerce and travel. This was largely due to developments in navigation and naval technology that made sea travel faster, cheaper, safer, and surer than long-distance overland travel. When the Mongol Peace rejuvenated Silk Road travel across Eurasia for about a century (roughly 1260–1368), its main routes shifted northward toward and through the Mongol heartland. After the collapse of the Mongol empire, Timur-i Leng's city of Samarqand in present-day Uzbekistan became a new nexus for the Silk Road for about a century, thanks to his and his Timurid successors' patronage and aggressive commercial policies. By 1500, however, with the entry of Western Europeans into the Indian Ocean by way of the Cape of Good Hope, the caravan routes of the Silk Road were again being superseded by maritime routes, and the volume of traffic along its many routes fell dramatically. Of course, insofar as political, military, and environmental factors allowed, these caravan routes were never abandoned, especially when it came to tying India, China, and Russia to Central Asia. In the centuries to follow and until the rise of railroads, however, oceanic travel was the element above all else that tied the world into a globalized entity.

Old routes were expanded, and new routes developed across the Sahara and deeply into the savanna empires of West Africa. In Oceania, expert navigators added routes to and from Aotearoa (New Zealand) to the Polynesian Triangle, and in South America, the Incas transformed mountain pathways into a coherent Incan road system in order to tie their vast empire together.

Finally, a brand new route opened up during the last decade of the fifteenth century that ulti-

mately proved transformative in the course of world history, namely the sea route connecting Iberia (and West Africa) with the Americas. Within a few short decades, connections between the Eastern and Western Hemispheres of the world would be multiplied many times over.

—Alfred J. Andrea

Caravans across the Sahara

The caravan trade across the Sahara supplied most of the world's gold and became a conduit for the spread of Islam in West Africa between 1000 and 1500. Dominance over trade routes became a major factor in the rise and fall of savanna states including Ghana and Mali. An ocean of sand, the Sahara was traversed at great risk and for even greater profits.

Although Berber and Tuareg merchants traded gold before the arrival of Islam, regular caravan trade was made possible by the introduction of the single-humped camel, or dromedary, around the second century CE. The growing demand for gold in Eurasia led to the development of commercial networks. Islam in turn sparked the growth of ports on the edge of the desert (the so-called *sahel*, or shore of the desert) and helped to unify the cultural and commercial life of these outposts and other urban centers to the south.

During the first half of the second millennium, gold was mined from the alluvial deposits at Bambuk and Bure on the Senegal and Niger rivers, the Lobi gold fields along the Upper Black Volta, as well as the exceedingly rich forest and coastal sites farther south in Akan territory. African gold was a well-known commodity, as illustrated by the 1375 map by Abraham Cresques of Majorca, known as the *Catalan World Atlas*, showing Mansa Musa, the ruler of Mali, holding an enormous gold nugget. Yet most Muslim merchants from the north were unaware of the locations of the gold sources, since goods were transferred to camel caravans in cities along the Niger for the next journey northward. Indigenous West African Dyula merchants, who steadily converted to Islam over the years, were among those who carried the gold northward to collecting points in the *sahel*. They settled in communities that had relatively few converts to Islam

such as Begho north of the Akan gold fields, occupying distinctive Muslim quarters of the town and maintaining responsibility for the steady flow of technology and trade.

More than gold was traded across the Sahara. Foodstuffs, textiles, salt, copper, horses, ivory, books, kola nuts, leather, and slaves as well as ideas and diseases also made their way via camel caravan. Merchants were joined by pilgrims on their hajj to Mecca and by other adventure travelers, scholars, and craftsmen. Travel itself became a virtue, as many cultural proverbs testify.

Trans-Saharan caravans were organized by specialized merchant families, which acted as hosts and agents and provided the key connections linking buyers and sellers of goods stored in warehouses. The caravan journeys were speeded up with the use of the camel, which could travel for more than ten days without water while carrying loads of anywhere from about 330 pounds to 440 pounds (150 to 200 kilos) in weight. Because of the intense heat of the desert sun, travel took place in early morning or late afternoon. When joined by hundreds of slaves, porters, or pilgrims on foot, these caravans could stretch for many miles. The fourteenth-century traveler Ibn Battuta described one small leg of the journey along the trail from the copper mines of Takadda northward to a site north of Air in southern Morocco during which the travelers saw no sign of habitation for weeks at a time.

Shorter caravan routes across the Sahara stretched southward from Fez to the walled towns of Kanem in the central Sudan and the borders of Darfur to the east. Kanem was ruled by a Muslim dynasty in the eleventh century, and the empire expanded militarily during the reign of Mai Dunama Dibalami (r. 1210–1247). With legendary horse cavalry of some 40,000 troops, the empire secured the entire length of caravan routes between the Lake Chad basin in the Sudan and the Fezzan, the outpost of Moroccan rule. Tuareg control of horses, salt, and copper extended caravan trade to the Hausa states, where the goods were exchanged for cotton textiles and leatherwork by the end of the fifteenth century. The Hausa language would become West Africa's lingua franca and the conduit for commercial and cultural change for centuries to come.

—Candice Goucher

A West African king, probably Mansa Musa, holds a gold nugget amid scenes depicting the rich trade of the Saharan region. From the Catalan Atlas, crafted for the king of Aragon by the Jewish cartographer Abraham Cresques, probably in 1375. (The Art Archive/John Webb)

THE LOST CARAVAN OF MAJABAT AL-KOUBRA

Not every trans-Saharan caravan arrived safely, and one of the unfortunate failures was the journey of a twelfth-century camel caravan buried in sand dunes halfway across the desert at Majabat Al-Koubra. Discovered and excavated by the French archaeologist Theodore Monod, the remains of the site's cargo lost in the Mauritanian Sahara provide material confirmation of the extensive long-distance trade in two key commodities: copper-alloys and cowrie shells.

About 2,000 brass rods together with cowrie shells of the species *Monetaria moneta* had been loaded on camels in North Africa. Both commodities were used as currencies in the western Sudan, but the copper alloys in particular would have provided materials in high demand for the metallurgical arts of industrial West Africa. Which had traveled the longer distance? Historians still debate the sources of copper, but the shells were more than 5,500 miles (8,850 kilometers) from their source in the Maldive Islands of the Indian Ocean. Their survival in the sands of the Sahara gives witness to the remarkable world connections of African trade in the past millennium.

From the Straits of Malacca to Madagascar—The Indian Ocean Ecumene

The band of interacting trading communities located on the coasts of the Indian Ocean constituted a cultural continuum by 1300 CE. This was a multi-ethnic world, which nevertheless shared a common conversation in civilization and culture. This Indian Ocean ecumene developed in two phases: 1000–1250 and 1250–1500. During the early phase, the Indian Ocean trade route connected the different communities in the Indian Ocean littoral, but culturally the area of Muslim preeminence was confined to the area west of India's Malabar (southwestern) Coast. East of that coast and across the Bay of Bengal into the Malay Archipelago, it was largely Tamil Hindu beliefs and practices that dominated the cultures of continental Indians and the coastal peoples of the central Indian Ocean and Southeast Asia. This early phase witnessed the most expansive period in the power of the Tamil empires of the Cholas and the Pandyas who held the Malay Srivijaya empire in the Malay Archipelago in a tributary relationship until Srivijaya was destroyed by its own tributaries in 1293. The second phase in the development of the Indian Ocean ecumene witnessed the mostly peaceful conversion in the thirteenth through the fifteenth century of the peoples in the Malay Peninsula and archipelago.

Around the year 1000, the Malay Peninsula and Sumatra were part of the Buddhist Srivijaya empire, which controlled and protected oceanic trade through the straits of Sunda and Malacca. Srivijaya, under the Sailendras dynasty, had formerly also controlled much of central Java, but in the mid-tenth century, a Hindu dynasty replaced

the Buddhist Sailendras there. One of the most important economic and cultural concerns of Srivijaya was the care and protection of Buddhist pilgrims from Southeast Asia, China, Japan, and Korea. Buddhist monasteries near the present-day city of Palembang served as rest houses for pilgrims on their way to the great Buddhist monastic center of higher education at Nalanda (in present-day Bihar, India). In 1025, the Tamil ruler Rajendra Chola took his navy across the Bay of Bengal and sacked the Srivijaya capital. The Chola kings, devout worshippers of Shiva, reduced Srivijaya to a tributary status and changed the dominant religion to Saivite Hinduism. From the conquest of Srivijaya to the mid-thirteenth century, the Tamil Chola empire dominated the eastern part of the Indian Ocean ecumene, including the Malay Peninsula and some of the archipelago (present-day Malaya, Indonesia and the Philippines), as well as South India, northern Sri Lanka and the Maldives Islands. The Cholas disseminated Hindu culture in the process of exerting Tamil power. Tamil merchants frequented all of the ports in this empire, bringing Brahmin priests, Saivite rituals, and the Hindu epics of the *Mahabharata* and *Ramayana*. Southeast Asian culture, already highly saturated by Indian influences, became even more so.

Meanwhile, in the far western part of the Indian Ocean ecumene, the Swahili cities on Africa's east coast had begun conversion to Sunni Islam before the tenth century, and their inhabitants were noted for their Islamic piety. In the process of conversion, the Swahili coast became an integral part of Dar al-Islam and was noted for the beauty of its mosques and the correct manners of its people.

In the last centuries of the first millennium, the Swahili people had constructed trading towns on the coast and coastal islands from Mogadishu to Sofala. During the early part of this period, the chief cities were Lamu, Mombassa, and Kilwa. All of these cities were independent city-states whose rulers claimed descent from Shirazi Persian or Wadebuli Indian merchant kings. These cities were involved in the export of ivory, rhinoceros horn, ebony, gold, pig iron, and slaves. On their part, the Swahili cities imported gold from Zimbabwe and traded with Malagasy colonies in the Comoro Islands and northwestern

Madagascar. Indigenous Bantu merchant houses handled much of the commerce, but they intermarried with immigrant Arab, Omani, Persian and Indian merchants to form a Swahili ethnicity that has persisted into modern times.

Cairo, which had been founded as a Fatimid city in the tenth century, emerged as the nerve center and great emporium of the Indian Ocean ecumene. From Cairo, Muslim merchants, as well as some Jewish and occasional Christian (mostly Italian) traders, set forth into the Red Sea and from there to the Indian Ocean. Before the thirteenth century, these merchants usually journeyed as far as the Malabar ports of India. In those ports, Indian traders, members of Indian merchant guilds, took over, and shipped some of the merchandise that had originated in Cairo to the Malay Peninsula and archipelago. In Cairo the Jewish merchants left what has become the most important surviving historical archive of medieval Cairene trade in the synagogue's geniza, a depository of Jewish letters and records, many of which were commercial transactions.

After Cairo, other important western Indian Ocean merchant communities were in Oman where merchandise (including slaves) from the Swahili cities was transshipped to the ports on the Malabar Coast. The trade in horses from Arabia to India was a profitable and growing item of commerce for Omani merchants. Siraf, one of the most important Persian Indian Ocean ports, shipped out blue cobalt ore for use in the production of Chinese blue porcelain.

The Malabar Coast of southwestern India was perhaps the most interesting ethnic potpourri of the Indian Ocean littoral. Extending from near present-day Mumbai (formerly Bombay) to Cape Comorin, this region had traded across the Arabian Sea since the early centuries of the Roman empire. It was a very productive region, manufacturing the best steel swords in antiquity and the medieval period, and it was the source of most of the globe's pepper, the world's most-used spice. Wealthy merchants, who were given special privileges by the rulers, dominated its cities, particularly Calicut, Cochin, and Kanner. From the time of the emergence of the Islamic caliphate, Arab and Persian merchants had formed expatriate Muslim colonies in these cities but also, from early in the Common Era, these cities

➤ PROMOTING COMMERCE AT CALICUT

Two visitors to Calicut on the Malabar Coast, the famous trans-Afro-Eurasian traveler Ibn Battuta, who arrived there in 1341, and Ma Huan, who visited the port city on at least one of the seven voyages of the fleets led by Zheng He (1405–1433), provide valuable testimony regarding the city's flourishing maritime commerce. What is particularly remarkable is that the city had no natural harbor. Ships had to anchor off the coast and transport their goods to shore in small craft. As these visitors' two accounts suggest, however, the policies put in place by Calicut's *samudri rajas* ("lords of the sea," a title corrupted by the Portuguese to *zamorin*) more than compensated for that deficiency.

According to Ibn Battuta, 13 Chinese vessels of various sizes were anchored there, several of which were four-masted and held a complement of 600 sailors and 400 marines. One of the reasons so many Chinese and other merchants did business at Calicut was that its *sultan Sâmári* (as Ibn Battuta termed the *samudri raja*) returned intact to its owners any and all shipwrecked cargo, rather than confiscating it. Of all the cities of this coast, Calicut alone did not claim such goods for its treasury.

Ma Huan informs his readers that the "king" of Calicut appointed two brokers to superintend all sales, and to guarantee the honesty of all transactions and the inviolability of contractual arrangements. As a result, "foreign ships from every place come there."

—Alfred J. Andrea

had been the homes of Cochin Jews, who claimed descent from refugees fleeing the destruction of the Second Temple in 70 CE, as well as Syrian, or St. Thomas, Christians, most of whom were said to be converts from the Cochin Jews evangelized by Christian missionaries in the fourth century. Before its demise in the thirteenth century, the Chola empire ruled much of the Malabar Coast, but after that, local rulers were more important. Calicut's *Zomorin* (raja, or lord) emerged as a powerful ruler because of his dealings with Arab merchants and his army of Muslim mercenaries.

After the fall of Chola power and the rise of the Delhi sultanate in India, Muslim merchants

came to dominate almost all of the Indian Ocean trade. Muslim influence displaced that of the Hindus in coastal Southeast Asia as well as the Malay Peninsula and archipelago. Muslim merchants settled in Malay cities and began the process of converting the Hinduized indigenes. Marrying into local families, Muslim merchants, because of the hemispheric reach of their trade network, became the “big men” of their communities. In the late fourteenth century, Malacca became a Muslim sultanate. Within a few decades, most of the Malay Peninsula was ruled by Muslim sultans, and, by the end of the fifteenth century, the Hindu empire of Majapahit, which ruled most of Indonesia and some of the Philippines, had fallen, to be replaced by Muslim sultanates. The Indian Ocean had become a Muslim lake, and the Indian Ocean coast did indeed, constitute an “Indian Ocean ecumene.”

Throughout this period, the pilgrim trade, transporting pilgrims to the holy Muslim cities of Mecca and Medina, was one of the principal elements of commerce in the Indian Ocean. With the Islamic conversion of large populations in South and Southeast Asia, especially after the thirteenth century, the transportation of Muslim pilgrims burgeoned as never before and overshadowed all other varieties of commerce in the Indian Ocean. The pilgrimage to Mecca (Makkah) served to unify the increasingly Islamicized high culture of the Indian Ocean littoral, as pilgrims and students from every corner of the Muslim world imbibed, in Mecca and Medina, the latest in Muslim scholarship and practice and brought it, together with the “civilized” manners (*adab*) of the refined Muslim gentleman, back to their homelands. Muslim teachings also involved the acceptance of Sharia, the Muslim system of jurisprudence that included a system of commercial law that came to govern commercial relations throughout the ecumene.

Jewish Travelers in the Early Middle Ages

By the early Middle Ages, the Jewish Diaspora had included one of the most widely dispersed populations in the history of the world. Jewish communities could be found from the Atlantic Ocean in the west to the South China Sea in the east and from Ethiopia and India in the south to the steppes of Siberia in the north. This dispersion, together with the consolidation of the major trans-Eurasia trade network under the relatively stable Frankish, Byzantine, Khazar, Abbasid, Uighur, and Chinese empires, created an ideal set of circumstances for Jewish traders, adventurers, and explorers.

Some Jews wandered the roads and sea-lanes in search of wealth. Jewish travelers and merchants could rely on sanctuary and hospitality in Jewish communities situated in towns all over Eurasia and northern Africa. The Radhanites, a Jewish mercantile association that traded between Europe and China, are a prime example of Jews who took full advantage of the beneficial aspects of dispersion, bringing prosperity to many communities along their trade routes. Other Jewish merchant guilds may have existed in either competition or cooperation with the Radhanites. According to the tenth-century Arabic book *Ajaib al-Hind* (*The Wonders of India*) by Buzurg ibn Shahriyar of Ramhurmuz, a Jew named Ishaq traveled from Oman to India, Bhutan, and China, where he lived for 30 years and became fabulously wealthy. He returned to Oman in 912 or 913 but was later murdered in Sumatra on orders of Oman’s governor, Ahmad ibn Hilal. Another Jewish merchant, Ibrahim ibn Yaqub of Tortosa (present-day Tartus in Syria), visited France, Germany, and Bohemia, plying his trade at the court of the German emperor Otto I in 966. Yaqub later visited the Vikings of Hedeby (southern Denmark) and the nascent kingdom of Poland.

➤ BENJAMIN OF TUDELA

Benjamin ben Jonah, a medieval rabbi and explorer, was born in the middle of the twelfth century in the town of Tudela in Christian Spain. He began his journey from Saragossa in 1160 as a pilgrim to Jerusalem. It is unclear whether Benjamin also had a commercial motive for his travels. He went down the valley of the Ebro River and crossed into France, setting sail from the port of Marseilles for Rome and then Constantinople. From there he traveled through Anatolia, turning south through Syria, the Galilee, and Judea before stopping in Jerusalem. At some point thereafter he went to Mesopotamia and Persia before setting sail again for Egypt and North Africa (via the Arabian and Red Seas), returning to Spain in 1173.

During his 13-year journey Benjamin visited more than 300 cities, including Rome, Constantinople, Alexandria, Jerusalem, Damascus, and Baghdad. He took what was colloquially known as the long road, meaning that he made frequent extended stops, where he studied the local Jewish community, making detailed notes about local customs, politics, geography, and other matters, especially the status and state of the local Jewish community. He visited and described many people who are otherwise obscure and poorly attested to, including the Druze of Lebanon, the Nizari (Assassins) of Syria and Iraq, and the Wallachians of what is now Romania. He made extensive observations regarding the court of the Byzantine emperor and the caliph of Baghdad as well as the Jewish exilarch, or head of the People in Exile, who resided in Baghdad and enjoyed, thanks to the patronage of the Abbasid caliph, extensive prestige and authority over the Jews of West Asia.

After Benjamin's return to Spain his observations were organized and published under the

Engraving of Benjamin of Tudela, twelfth-century Spanish traveler and rabbi. (Roger-Viollet/The Image Works)

title *Sefer ha-Maasot shel Rabbi Benjamin* (*Book of the Deeds of Rabbi Benjamin*). In it he describes the places he visited, the people he met, and sites and landmarks he passed along the way. Unlike many medieval chroniclers, Benjamin not only reported facts but also cited his sources and is regarded by modern historians as an invaluable source.

—Brian Gottesman

Many Jews, fluent in a number of languages in order to communicate with their brethren in other lands, turned their talents toward diplomacy. A man known as Isaac the Jew, an adviser in the court of Charlemagne, accompanied the emperor's embassy on a visit to Caliph Harun al-Rashid in 797 as an interpreter. Isaac returned several years later with an elephant, sent as a gift by the caliph to Charlemagne. Hisdai ibn Shaprut (915–70), a Spanish Jew who became court

physician and foreign minister to Caliph Abd-ar-Rahman III of Cordoba, relied on Jewish travelers to carry his diplomatic correspondence. The correspondence between King Joseph of the Khazars, who dwelt in the region of the Caspian Sea, and Hisdai indicates that a number of Jewish adventurers, including Judah ben Meir, Joseph Gagris, and Isaac ben Eliezer from the land of Nemetz (Germany) were responsible for transmitting Hisdai's letter to the king.

Still other travelers appear to have wandered for purely spiritual reasons. From the sixth to the eleventh centuries Jewish communities around the world often submitted queries of a religious nature to the *gaonim*, the heads of the Talmudic academies of Sura and Pumbedita in Mesopotamia, as well as to other famous rabbis in the centers of learning in the Holy Land. The rabbis and *gaonim* would reply with written documents called *responsa*, many of which still survive to this day. The questions and their responses would have to be carried by emissaries who often traveled for months or even years to reach and return from Babylonia. Along the route they would be hosted at Jewish communities, who would scrupulously copy down the answer of the *gaonim* for their future reference. Travelers from these towns would in turn transmit the *responsa* to nearby communities, propagating a uniform observance of the Torah and *halakha* (Jewish religious law). Some rabbis traveled for the purpose of bringing their learning to Jews living at the margins of the Jewish world. For example, medieval Jewish sources report that a rabbi called Isaac ha-Sangari was responsible for converting the Khazars, a Turco-Mongol people, to Judaism in the ninth century and bringing in scholars to teach them Jewish law and customs, but historians today debate his historicity; a later rabbi, Isaac ben Abraham, is reported by the scholar Saadia Gaon to have moved from Iraq to Khazaria, possibly as a missionary.

Pilgrimage was a common motivation for travel. Judah ha-Levi, a famous tenth-century jurist, scholar, and poet of Muslim Spain, left the comforts of Cordova to make the difficult journey to Jerusalem while in his sixties; he died shortly after completing his voyage. Jews such as Benjamin of Tudela and Petachiah of Ratisbon (both late twelfth to early thirteenth century) probably began their far-flung travels as pilgrims. Petachiah traveled east from Bohemia through Eastern Europe and southern Russia before turning south into Caucasus, Armenia, Mesopotamia, and Persia. He then traveled west into the Levant, ending his journey in Jerusalem before returning home via Greece and the Balkans. His contemporary Benjamin of Tudela traveled across Europe to reach Jerusalem before setting off on a series of expeditions in Asia and Africa.

Jews sometimes traveled to collect charity from the communities they passed, either for a specific family or person, to fund a yeshiva (school of religious learning), or to provide relief to Jews suffering from hardship. A Jew of Kiev made a long journey carrying a letter from the rabbinical council of the city in the tenth century; his purpose was to collect alms to pay off his extensive debts and prevent his sale into debt-slavery. His letter has been found in a Cairo synagogue; whether he died in Egypt or left the letter behind, having achieved his goal, is unknown. Moses ben Hanoch, another tenth-century Jew, left Iraq with his wife and son to collect funds for the yeshiva of Sura. The family was captured by pirates, and Moses's wife committed suicide to avoid rape; shortly thereafter Moses and his son were redeemed by the community of Cordoba, where he became a prominent religious authority.

Travel for study was common. Those who were promising enough and whose communities could afford it were often sent to Mesopotamia, the Holy Land, or Kairouan in North Africa, to study Jewish law and jurisprudence. Rabbis from Kiev studied in England in the eleventh century, and Abraham ibn Daud reported that Khazar Jews studied in the Talmudic academies of Spain in the thirteenth century. Some Jews traveled for more secular studies; Jacob ben Sheara and Jacob ibn Tariq were two Mesopotamian Jews of the tenth century who journeyed to Sri Lanka to study astronomy and brought back astronomical texts upon their returns. Abraham ibn Daud also mentions a Jew named Joseph who reportedly studied mathematics in India and brought the so-called Arabic numerals to Europe. A Jewish school of cartography existed on Majorca during the twelfth through the fifteenth centuries; the mapmakers who studied there relied on Jewish travelers for much of their information. A document of King James IV of Majorca mentions a Jew named Yuceff Faquin whose claims to have circumnavigated the globe in the late fourteenth century are impossible to substantiate.

Then there are those travelers whose motivations are difficult to categorize. Perhaps the most mysterious was a man who called himself Eldad ha-Dani ("Eldad of the Tribe of Dan") who

arrived in Spain around the year 880. Eldad claimed to have come from Ethiopia (where Jewish tribes and statelets did exist) and to have traveled extensively in North Africa and the Middle East. He brought fabulous tales (almost certainly exaggerated or invented) of Jewish kingdoms, mythical beasts, and ancient civilizations, including an island protected by a magic river where the descendents of Moses lived in contemplation and prayer. Seven decades later scholars were still puzzling over Eldad's tales; Hisdai ibn Shaprut's letter to the Khazar king Joseph contains a query regarding their veracity.

Abraham ibn Ezra, a famous twelfth-century Spanish rabbi, left home after a series of family tragedies and wandered aimlessly through Provence, Italy, France, England, north Africa, Greece, the Middle East, and India. His book *Reshit Hokhmah* contains important information on these regions, especially the Jewish communities. Judah al-Harizi, whose extensive travels in Europe and Asia from 1216 to 1230 were documented in his classical work *Tabkemoni*, provided invaluable insights into geography and the political landscape of his period.

The collapse of many trans-Eurasian trade routes in the eleventh and twelfth centuries made travel in general, and for Jews in particular, exceedingly difficult. Nonetheless, Jews continued to involve themselves with exploration and travel. Luis de Torres, Columbus's interpreter, was a Jew baptized the day before the expedition's departure. Joao Peraz of Covilha, Alfonso de Paiva, Abraham of Beja, and Joseph Copateiro, all Jews, were prominent in Portugal's early expeditions to discover overland and sea routes to India and East Asia. Hernando Alonso, a Spanish Jew, was an aide and master shipbuilder for Cortez. In 1528 Alonso was denounced as a Judaizer (a convert who had secretly relapsed to Judaism) and became one of the first people burned at the stake by the Inquisition in the New World. David Reubeni, a self-proclaimed messiah who appeared in Italy in 1524, came from Arabia or India. Pedro Teixeira, a converso, circumnavigated the globe with Magellan and explored the Amazon basin. These travelers and others like them, in addition to contributing to human knowledge generally, served a vital function in continuing to keep the lines of communi-

cation between the far-flung communities of the Jewish world open.

The Silk Road during the Pax Mongolica, 1260–1368

During the period of peace and stability that prevailed after the Mongol conquests, conventionally known as the Pax Mongolica (1260–1368), trade flourished along the Silk Road (the overland commercial routes linking Western Eurasia and China, named collectively in 1877 by the German geographer Ferdinand von Richthofen after one of the principal commodities, silk). Merchants from West and Central Asia, as well as a considerable number of Europeans, of whom Marco Polo is undoubtedly the most famous, traveled throughout the Mongol empire plying their wares and at times taking posts in the Mongol administration. They traded luxury items such as fine jewels, as well as less expensive goods such as plain raw silk. Their two main routes were the overland trail from the port city of Tana through the territory of the Golden Horde in Central Asia to China and the route from Trebizond, in what is now northeastern Turkey, to Tabriz in Iran and from there around the periphery of the Taklamakan Desert to China.

There were two main reasons for the influx of merchants and growth in trade during this period: the development of a safe and secure transportation infrastructure and the direct promotion of commerce by the Mongols. In order to facilitate communication across their vast empire, the khans—particularly Chinggis Khan's successor, Ogedei (r. 1229–1241)—developed a sophisticated postal relay system (*yam*). Spaced

➤ DID MARCO POLO GO TO CHINA?

In *Did Marco Polo Go to China?* (1995), Frances Wood argued that although Marco's father and uncle went to China, Marco himself probably did not travel beyond the Black Sea. Wood's thesis, which she has drastically toned down recently in the face of overwhelming criticism, rests principally on arguments from silence, the most important being Marco's failure to mention the Great Wall; his failure to mention important aspects of Chinese life, such as the Chinese writing system and tea; and the failure of Chinese sources to mention Marco or his visit.

All of these omissions, however, can be adequately explained. The Great Wall, for instance, did not yet exist at the time of Marco's visit. Although a series of unconnected walls existed along China's northern border, the massive wall that stands today was not built until the Ming dynasty. As for Marco's failure to mention important aspects of Chinese life, it should be kept in mind that Marco spent most of his time with the

Mongol overlords and foreign merchants, not the subject Chinese. This fact likewise explains the failure of Chinese sources to mention Marco and his visit.

Two details cannot be explained on the assumption that Marco did not go to China: (1) Venetian court records confirming the existence of the three gold paiza given by Khubilai Khan to the three Polos, as well as Marco's possession of a gold paiza at the time of his death, and (2) his knowledge of the 1290 embassy escorting Princess Kokechin to Arghun, the il-khan of Persia. Marco's account of the embassy tallies perfectly with the only other two sources—Chinese and Persian, respectively—that detail this episode. In fact, it alone provides us with the details that allow us to reconcile the other two accounts. Since Marco could not have obtained this information from any written source and an oral source is unlikely, we must conclude that his information was firsthand.

—John Wei

a day's journey apart, these relay stations provided fresh mounts, free food, and accommodations to all those traveling on official business, that is, all those who possessed appropriate tablets of authority, known as *paizas*. Paizas were oblong or round inscribed tablets given to dignitaries and envoys on official missions or to certain officials as signs of office. Their material—gold, silver, and bronze—differed according to the recipient's status. Marco Polo and his family members, for instance, received seven paizas, four of which were made out of gold. The protection that merchants such as the Polos received along the postal relay routes, as well as the food and accommodations, essentially amounted to a government subsidy of trade.

The khans also promoted trade in more direct ways. During the first half of the thirteenth century, they implemented policies that attracted merchants to the Mongol court, such as buying goods at above-market prices and making advantageous loans to merchants. Mongols entered into trade partnerships, known as *ortaq*s, investing large sums of money that they then received back with interest. Later on, the Mongols took a direct

hand in organizing various industries, most notably the textile industry. Already in the expansionist phase of the Mongol empire, the Mongols took care to identify and spare the lives of artisans, whom they resettled in Inner and East Asia. In the 1230s and 1240s, a formal organization of artisans on a wide scale took place, while beginning in Khubilai Khan's reign (r. 1260–1294) a further reorganization of artisans took place throughout Yuan China. This forced resettlement of peoples facilitated not only the transfer of goods but also the interchange of artistic techniques and methods of production. The goods produced by these transplanted colonies of artisans and court-sponsored workshops were used by the Mongols themselves as well as traded along the Silk Road.

The large concentration of merchants in Mongol-controlled territories coupled with the Mongols' own unfamiliarity with governing sedentary peoples led quite naturally to an alliance between the two groups. Large numbers of foreign merchants entered government employment, taking jobs as commercial agents, diplomats, spies, tax collectors, and bureaucrats. Literate, able to

keep accounts, and skilled in foreign languages, merchants adapted very well to these posts. Moreover, since foreign merchants—unlike the local elites employed by the Mongols—were outsiders, they had to depend upon the government for support; consequently, they were more likely to look upon the Mongols as benefactors and less likely to foment trouble by siding with subject peoples.

Unfortunately, many of the foreign merchants employed by the Mongols engaged in oppressive practices, in particular, extortion, usury (charging excessive interest), and tax farming. Tax farming was the age-old practice of a private person paying the government a stipulated sum for the right to collect and keep tax monies. The potential profit was a strong incentive for wringing excessive amounts from taxpayers. Complaints about these abuses appear repeatedly in Chinese documents from this period. Yet aside from Khubilai Khan, no other emperor seems to have tried to curtail or rectify these practices. This unchecked corruption eventually led to the overthrow of the Mongol Yuan dynasty and the establishment of the Ming dynasty in 1368, two events that along with other political disorders in Central Asia and the outbreak of the plague brought about the decline of Silk Road trade.

The Silk Road after the Collapse of the Mongol Empire

After the collapse of the Mongol empire, European trade along the Silk Road came to a virtual end. Already in the late 1330s with the division of the Chaghatai khanate, the smallest of the Mongol khanates, into two entities, Mughulistan and Transoxiana, the overland trade routes in Central Asia were becoming dangerous and inhospitable to merchants. Warfare in the following decades—civil war in Byzantium, attacks by the Golden Horde, the expansion of the Mameluks, the initial expansion of the Ottomans, and the rise of Timur-i Leng (Tamerlane)—combined with the outbreak of the highly infectious bacterium *yersinia pestis* in its bubonic and pneumonic forms, known in Europe as the Black Death (1347–1350), further discouraged trade and travel. Essentially the western ends of the two major overland routes linking Europe to China, the one through Anatolia and the one north of the Caspian Sea, were closed. For instance, while we know the names of dozens of merchants who traveled to East Asia during the period 1260–1363, we know the existence of but two active there between 1363 and 1440: Niccolo from Fulin and Nicolò de' Conti from Chioggia.

The closing off of the Silk Road to the West led to Christian Europe's greater reliance on trade with Muslim middlemen in Egypt and Syria. This, along with a desire to find Christian allies in the East (the mythical Prester John), provided Europeans with a strong stimulus to search for alternative routes to the "Indies." Their efforts eventually touched off the age of exploration: Columbus's discovery of America in 1492 and Da Gama's rounding of the Cape of Good Hope in 1498.

Despite the decline in the western portions of the Silk Road, trade in the Central and East Asian portions continued, albeit at a much reduced level. The collapse of the Mongol dynasty followed by the establishment of the Ming dynasty in China in 1368 led to a dropoff in trade between the northern steppe and China. Under Timur-i Leng (ca. 1330–1405) and his successors, however, Samarqand became a major economic hub that attracted merchants and caravans from both China and the West. At the same time, the

► TIMUR-I LENG'S SAMARQAND AND THE SILK ROAD'S INDIAN SUMMER

In 1403 King Henry III of Castile-León dispatched Ruy González de Clavijo on an embassy to Timur-i Leng. After 15 months and almost 3,000 miles (4,828 kilometers) of travel, Clavijo reached Timur's court in Samarqand. His effort to establish an alliance against the Muslim powers of western Asia failed, but Clavijo left behind an important account of his adventures. In the following selection, he describes Samarqand's place on the Silk Road.

"... Samarqand is not only rich in food stuffs but also in manufactures, such as factories of silk. . . , also crapes, taffetas . . . which are all produced here in great numbers. Further, they make up special fur linings for silk garments, and manufacture stuffs in gold and blue with other colors of diverse tints dyed, and besides all these kinds of stuffs there are the spices. Thus trade has always been fostered by Timur with the view of making his capital the noblest of cities: and during all his conquests wheresoever he came he carried off the best men of the population to people Samarqand, bringing there the master-craftsmen of all nations. Thus from Damascus he carried away with him all the weavers of that city, those who worked at the silk looms . . . also the craftsmen in glass and

porcelain, who are known to be the best in all the world. From Turkey he had brought their gunsmiths . . . and all men of other crafts wheresoever he found them, such as silversmiths and masons. These all were in very great numbers, indeed so many had been brought together of craftsmen of all sorts that of every denomination and kind you might find many master-workmen established in the capital . . . The markets of Samarqand further are amply stored with merchandise imported from distant and foreign countries. From Russia and Tartary [the khanate of the Golden Horde] come leathers and linens, from Cathay silk stuffs that are the finest in the whole world . . . From India there are brought to Samarqand the smaller spices, which indeed are the most costly of the kind, such as nutmegs and cloves and mace with cinnamon . . . all these with many other kinds that are never to be found in the markets of Alexandria."

early Ming emperors encouraged trade in the form of diplomatic and tributary embassies in which the bestowal of Chinese "gifts" camouflaged the Middle Kingdom's paying of tribute to various neighbors, especially steppe nomads. These embassies traveled not only overland, following the Silk Road, but also by sea. The celebrated seven voyages of Zheng He (1405–1433) are the most well-known instances of these embassies, as well as some of the last examples of them, for as the fifteenth century progressed, Ming officials seem to have begun losing interest in trade with foreigners. Although Ming China continued to allow entry to foreign merchants and envoys, it stopped sending embassies of its own to Central Asia and beyond.

This last period of particular vitality along the Silk Road suffered a major decline with the collapse of the Timurid dynasty in 1506 and the growth and dominance of European traders in the Indian and Pacific oceans in the sixteenth

century. Yet despite all of this maritime activity, Western Europeans did not usurp or dominate all trans-Eurasian trade. Not only did the Silk Road continue to bear some long-distance traffic in the sixteenth century, but under China's Manchu, or Qing, dynasty (1644–1911) there was a marked upturn in overland trade along the ancient pathways of the Silk Road with China's victories over the Mongol Junghurs in 1758–1759 and establishment of the Xinjiang (New Province) district in eastern Turkistan.

Viking Expansion—To the Faroes, Iceland, Greenland, and North America

The inner Scandinavian expansion marked by cultivation of new agricultural land and population growth from about 500 CE not only spurred the Viking raids on continental Europe and the British Isles but also led to the discovery, followed by the settlement, of the North Atlantic islands of the Faroes, Iceland, and Greenland. Norse immigration to the Faroes commenced in the early ninth century, but Celtic monks had already visited the islands. The majority of immigrants came from the southwestern parts of modern Norway. The medieval population lived mostly on subsistence farming, fishing, and whaling that produced no economic surplus that could form the basis of central governance. From the eleventh century, the Faroe people were taxed by the Norwegian Crown and were placed under the same jurisdiction as Shetland, also part of the Norwegian medieval North Sea empire. A bishopric was established on the islands in 1153 and made subject to the archbishopric of Nidaros in Norway.

During the thirteenth century, Iceland developed a rich written literary tradition that documented in detail its legends and history from the age of the first settlers. From these sources, known as the Icelandic Sagas, we know that Norse navigators discovered Iceland around 870. As with the Faroe Islands that lie north of Scotland, Celtic monks might have also visited Iceland prior to the arrival of Scandinavians. Many who resisted consolidation of the Norwegian Crown in the late ninth century left to settle on Iceland. Some also came over to escape injustice in the old country. The majority of these immigrants came from northwestern parts of Norway, but many also arrived from other Norse colonies.

Most of the arable land on Iceland was occupied around 930. The Icelanders now felt a need to develop a judicial system, and an envoy was sent to Norway to study the courts and laws there. Subsequently, the Allthing was established, where free men met each summer to settle disputes and pass laws. Over the ensuing decades the Icelandic court system was further developed, and the island was divided into 12 and later 13 jurisdictions that again were divided into 3

➤ A NORSE PENNY

Aside from the L'Anse aux Meadows site, only one other authentic Norse artifact has been found along the eastern coast of North America. This was a Norse penny minted between 1065 and 1080, about a half century after the Vinland voyages mentioned in the sagas. It was recovered from a prehistoric Native American occupation site on the coast of Maine. Other artifacts found at the site included a unique stone from Ramah Bay in far northern Labrador and a distinctive artifact of a type made by people using the Dorset technology. This has led archaeologists to conclude that it was brought to Labrador during a late-eleventh-century Norse voyage and that from there it reached present-day Maine through prehistoric Native American trade routes and exchange networks.

The Norse probably contacted Native American populations in southern Labrador and Newfoundland, Dorset ancestral Eskimos in northern Labrador, and probably the Inuit in the eastern Canadian Arctic. Occasional contacts involving both trade and plundering probably occurred over a period of several centuries. There is no evidence, however, that these contacts had any major influence on indigenous North American populations in terms of demography or culture.

—Peter N. Jones

subdivisions presided over by a local justice of the peace. Further reforms followed, and a supreme court was established with the Allthing in the early eleventh century. The Allthing adopted Christendom in 1000; the first bishopric was established in 1056 and a second in 1106. Both became subject to the archbishop of Nidaros in 1152.

A treaty between the Allthing and the Norwegian Crown guaranteed citizen's rights for Norwegians in Iceland and vice versa. But Norway gained further influence, benefiting from the division among the Icelanders, fear of civil war, and economic dependency on Norway. Finally in 1262, Iceland was made subject to the Crown. Law reforms were passed, royal officials replaced the justices of the peace, and the Allthing was reformed to become more in tune with its counterpart in Norway.

► THE EXCAVATION OF NORSE SETTLEMENTS ON NEWFOUNDLAND

The discovery and settlement in North America by Norse people around the year 1000 had long been known through Icelandic sagas. Final proof and the exact location of Norse settlements were not available until 1960, when Norwegian explorer and archaeologist Helge Ingstad and his wife Anne Stine waded ashore in L'Anse aux Meadows on the northern tip of Newfoundland. They were greeted by a local fisherman, who upon learning of their mission showed them an elevation in the surrounding landscape. Ingstad stated later that he sensed an aura of mystique about these features. They were barely visible but bore a striking resemblance to remains of known Norse settlements on Greenland. The local residents had believed them to be remains of an Indian camp but were soon to learn otherwise.

Excavations commenced the following year. They uncovered eight houses, an iron forge, a spinning wheel, multiple hearths, iron rivets, and many other artifacts and constructions. The layout of the houses was distinctively Norse, and the houses may have been home to between 70 and 80 individuals. They were oblong-shaped and were divided into several rooms. The walls were made of peat, and a box made of slate was placed beside the hearth to conserve the glowing coals over night. Any doubt that the findings were of Norse origin ended when a decorative bronze

L'Anse aux Meadows, site of an early-eleventh-century Viking colony at the tip of the Great Northern Peninsula of the island of Newfoundland. (Dylan Kereluk)

needle was found by Stine on September 2, 1968, the final day of the excavation.

The findings affected the contemporary local community. The site became a major tourist attraction and has been placed on the UNESCO World Heritage List, a welcome feature for a small community threatened by depopulation. A museum with a courtyard surrounded by reconstructed Norse longhouses has been erected, and local cafés and motels have taken on names such as Valhalla and The Norseman. L'Anse aux Meadows also hosted the presumed 1,000-year anniversary of Leiv (Leif) Erikson's discovery of North America in 2000.

—Frode Lindgjerdet

In 982, Erik the Red from Iceland arrived at the south of Greenland and returned three years later with a party of settlers. The Norse immigrants established themselves mainly in the Eastern Settlement near present-day Qaqortoq and the Western Settlement in Godthåbsfjorden. The settlers soon adopted Christianity, and a bishopric was established in 1124. About 1261, the Greenlanders voluntarily also became subjects of the Norwegian Crown. Approximately 3,000–6,000 people lived in these Norse settlements. In addition to fishing and farming, they traded ivory from walrus for grain to supplement the meager local agricultural output. Around 1300 the climate got colder, leading to failed crops and ice flows that prevented supplies from reaching the settlements. Economic and demographic cri-

ses in Europe also undermined their exports markets and thereby the basis for their much-needed foodstuff imports. The outside world lost contact with the Western Settlement after about 1350 and with the Eastern Settlement sometime after 1409. Both disappeared sometime before 1500, probably due to a combination of climatic change, the southward migration of the Inuit, epidemics, and raiding by pirates and slave traders.

From Greenland, Leiv (Leif) Erikson, son of Erik the Red, reached North America around the year 1000. The circumstances regarding Norse presence in the Western Hemisphere remain unclear, and the sagas seem to be full of inaccuracies and fictional adaptations on this point. They do relate that 140 people accompanied Erikson on a second voyage three years after his ini-

tial discovery. They settled at a place they called Vinland but soon left, according to the sagas, due to attacks from Native Americans, whom the Vikings called *skraelinger* (weaklings or wretches) because of their small physical stature compared to that of the Norsemen. Norse presence in North America in the Middle Ages was universally acknowledged following the 1960–1968 discovery and excavation of the irrefutable remains of a Norse settlement at L'Anse aux Meadows on the northern coast of Newfoundland.

Formal sovereignty over Greenland, Iceland, and the Faroe Islands followed Norway into union with Denmark in 1387, and the Danish king remained their sovereign after the mother country ceased to be an independent kingdom after 1450. While the Norse settlements on Iceland survived, contact with the outside world remained sporadic until the eighteenth century. Greenland and the Faroe Islands remain Danish dependencies today.

The Vinland Map

On the eve of Columbus Day 1965, Yale University Library announced that it owned a small black-and-white manuscript world map from about 1440 that showed the location of the North American region that Norse travelers had explored in the early eleventh century and named Vinland (Wine Land). Aided by a book-length commentary released at the same time, this allusion to medieval Norse contact with North America caught the public imagination, for prior to 1965 the earliest known depiction of Vinland had been Sigurd Stefansson's speculative "Skalholt Map" (about 1590) combining Norse saga descriptions with late-sixteenth-century geogra-

phy. Bound with an account of Friar John of Plano Carpini's mission during 1245–1247 to the Mongols (the so-called *Tartar Relation*), the map had been purchased in 1957 by Laurence C. Witten, a dealer in New Haven, Connecticut. At that time, the map was not only unprovenanced (no known history of origin and ownership) and in bad condition but was also anonymous and untitled.

The volume's provenance has still not been proved beyond 1957 and a connection to the Spanish-Italian dealer Enzo Ferrajoli de Ry; the map's condition has deteriorated further, and its likely author and purpose are still debated. The map had been named for its most striking feature by 1959, however, when Paul Mellon bought the "Vinland Map" volume from Witten and placed it in Yale's custody together with four separately bound sections of the thirteenth-century world history text *Speculum Historiale* (*Historical Mirror*) by Vincent of Beauvais. Matching wormholes supposedly connected the texts and apparently validated the map as a mid-fifteenth-century work, the period to which the paper marks in the two texts may be assigned.

The map was drawn on poor-quality parchment (cured animal skin) with crumbling carbon-based ink and shows a roughly mid-fifteenth-century concept of Eurasia and northern Africa, to which were added Iceland and Greenland in the northwestern Atlantic along with the feature identified by one short and one long legend, or caption, as *Vinilanda Insula* (The Island of Vinland). Five widely dispersed map captions indicate a worldwide Roman Church outreach and reveal a concern with illustrating medieval Christian missionary activity.

Both the map's failure to show the long Canadian coastline that the Norse kept exploring long after they had discovered grapes farther south and the outline of *Vinilanda Insula* are based on the nineteenth-century mistaken assumptions that the Norse voyages to America had been short-lived and that Vinland was Nova Scotia and Cape Breton combined. The precociously named *Magnum mare Tartarorum* (Great Tartar Sea) separating Northeast Asia from two unidentifiable islands in the farthest east has also worried scholars about this map, a work that furthermore lacks both antecedents and descendants

and that was never copied. Additional perennial concerns include the wormholes, the handwriting, the source of the map's fabric and sister texts, and the likely composition of the original codex (bound manuscript) involved.

The anomalous composition of the map's ink has nevertheless dominated the authenticity debate since 1974, when the McCrone Institute in Chicago found that the residual ink line contains anatase crystals modified by methods available only after about 1920. Confirmed by later studies, this discovery has led to a general, but not unanimous, conclusion that the "Vinland Map" is a modern fake. This conclusion is supported by the longer legend accompanying *Vinilanda Insula*, which contains references to medieval Norse historical events that are as colored by erroneous nineteenth-century ideas as the outline and placement of Vinland, a region that cannot in fact be defined because the medieval Norse neither used nor made maps and the literary sources are vague in that respect. They are clear enough, however, to reveal that the author of the "Vinland Map" was as ignorant about Norse naming practices as about Bishop Eirik of Greenland, who is in the historical record as having gone to Vinland in 1121 but whose fate and purpose are otherwise unknown. Both Vinland captions also run contrary to historical fact when claiming that Leif Erikson and Bjarni Herjolfsson discovered Vinland together, a notion that did not appear until 1765, when David Crantz made this ultimately unsubstantiated claim in his *Historie von Grönland*.

The cartographic, historical, and chemical indications that the Vinland Map is a modern fake preclude speculations that the map could have influenced fifteenth- and sixteenth-century European explorers in the North Atlantic.

Chola Imperialism and the Sanskritization of the Malay Peninsula and Archipelago

In the first millennium CE, Indian civilization spread from South Asia to the many kingdoms of mainland and island Southeast Asia, expanding the zone in which Indian literature, religions, and manners were a shared cultural currency. The transfer of Indian civilization to the Southeast Asian peninsula and the Malay (Indonesian) archipelago began in the early to middle centuries of the first millennium CE. It was a process mainly carried out by Indian and Southeast Asian merchants, missionaries, chiefly Buddhist, and, occasionally, embassies from Southeast Asian kingdoms intent on studying Indian culture. Large-scale migrations were not involved, although mercantile diasporas involving small numbers did play a role. Conquest of Southeast Asian kingdoms and imperialism by Indian states did occur, although it played a distinctly minor role.

The period in which Indian kingdoms exhibited the most bellicose imperialism towards the Southeast Asian kingdoms occurred during the late Chola empire (985–1279), especially during the reigns of the founder of the late Chola empire, Rajaraja Chola (r. 985–1014), and his successor Rajendra Chola (r. 1014–1044). Rajaraja created the Chola empire by defeating, but not destroying, the kingdoms of the Cheras on the Malabar Coast, the Pandyas (at the southern tip of the Indian Peninsula, centering on Madurai), and the Chalukyas, as well as subduing the northern half of the island of Sri Lanka. Rajendra extended Rajaraja's conquests to the Ganges, and, for a time, occupied all of Sri Lanka, although he never extinguished Singhalese resistance. Rajendra's land conquests were impressive, but his greatest achievement was the creation of a sea empire. Rajendra's powerful fleet patrolled the

eastern reaches of the Arabian Sea, annexing the Lakshadweep and Maldiv Islands. In the east, Rajendra's fleet raided all of the Southeast Asian coastlands and forced both mainland and island states to pay tribute. In 1025, Rajendra's ship-borne forces occupied and sacked the capital of Srivijaya, an empire with which the Cholas had hitherto been on excellent terms. The sacking of Srivijaya marked the zenith of Chola overseas imperialism. In the twelfth century, Southeast Asian tributes had become mere tokens, and Sri Lanka had regained its independence.

By the eleventh century, the ruling classes in the Southeast Asian kingdoms had become *sanskritized*; that is to say that they had adopted the "high culture" and religions of India, such as Mahayana and Theravada Buddhism, Saivite and Vaishnavite Hinduism, and, frequently, a *mélange* of these. Indian literature, especially the great epics (the *Mahabharata* and the *Ramayana*), was naturalized in all the Southeast Asian cultures, and the Indian conception of divine kingship was being used by all Southeast Asian rulers to define and legitimize their status. Brahmin priests, often from India, officiated at Hindu public rituals in Southeast Asian royal courts, and Southeast Asian kings took names from Sanskrit to increase their claims to divine favor.

In many parts of Southeast Asia Sanskrit, or Indian, culture, after permeating the courtly levels of the ruling classes, seeped out to the rural villages to influence the popular village culture. This was nowhere more true than in the Malay Peninsula and archipelago (present-day Malaysia, Indonesia and some of the Philippines) where the great Indian epics merged with the indigenous oral literature to produce art forms such as the shadow plays accompanied by gamelan music presented in rural villages even today, though this region is now largely Muslim.

The political history of the sanskritized kingdoms of the Malay Peninsula and archipelago has become part of the popular folklore, kept alive in the oral history along with versions of the *Mahabharata* and *Ramayana*. Briefly stated, we are told of three powerful native empires, which dominated the region consecutively: Srivijaya (late sixth to thirteenth century, centering in eastern Sumatra), Singhasari (thirteenth cen-

tury, East Java), and Majapahit (fourteenth through sixteenth century, centered in East Java).

Srivijaya was an empire of the sea, profiting from hemispheric trade that passed through the Sunda and Malacca straits. The rulers of Srivijaya used their strong navy to suppress piracy in those straits, but also to collect tolls from the merchants plying these waters. Srivijaya exercised hegemony over a wide swath of territory, stretching from the kingdom of Langkasuka in Malaya to the Brantas River in central Java. It was a devoutly Buddhist realm that, in the ninth century, built the great temple-monument of Borobudur. Although driven out of Java in the ninth century by a Saivite kingdom that built the impressive Hindu monument temple complex of Prambanan, and sacked by the Cholas in the eleventh century, Srivijaya endured as an important maritime power until the rising power of Majapahit destroyed it in 1377.

Singhasari and Majapahit were both East Javan states that exercised hegemony in the Malay Archipelago from the thirteenth century until the rise of Islam in the Malay Archipelago in the sixteenth century. In thirteenth-century Java under Singhasari rule, the process of adapting or naturalizing Indian forms to indigenous culture proceeded apace. Javan court as well as folk culture was a type of Hindu culture even as it was peculiarly localized and insisted on its strong Javan identity. Indian epics, temple dances, and artistic forms now all found their Indonesian voice.

In 1293, when the Mongols sent a powerful armada to Java to punish the Singhasari ruler for "impertinence," the local forces repulsed the Mongols, but in the melee, Majapahit overthrew the Singhasari state. Majapahit grew very powerful, creating the largest Southeast Asian empire in history. This empire included territory from Papua to western Malaya, and some of southern Philippines.

The fourteenth and fifteenth centuries were the golden age of Hindu Indonesia. Old Javan literature flourished, and old Hindu stories were recast in Indonesian forms. The caste system of India was reshaped into an Indonesian social system, with the peasants as the lowest caste. The different castes were very distinct, relying on

different dialects when speaking to each other, as in modern Bali.

By 1400, Majapahit power reached its zenith. As already mentioned, in 1377 a Majapahit force destroyed Srivijaya. This may have been a Pyrrhic victory, however, because one of the princes of the erstwhile Buddhist sea kingdom found allies among the Muslim traders in Aceh, on the western coast of Sumatra, and converted to Islam. This former prince of Srivijaya then established his power as the Sultan of Malacca, a city-state that in the subsequent century became a central force in the Islamification of the Malay Peninsula and archipelago. In the early 1500s, a coalition of Muslim sultanates defeated Majapahit and drove the Hindu society to take refuge on Bali.

Chinese Oceanic Commerce in the Age of Southern Song

Oceanic trade in the time of China's Southern Song dynasty (1127–1279) established strong diplomatic and economic relations with its trade partners, integrating China as an influential player in foreign economies across Southeast Asia and the Indian Ocean. Southern Song's flourishing domestic economy created high demand for imported luxuries and growth in the ranks of private investors willing to finance foreign trade endeavors. Additionally, the climate of instability in Song's military relations with its neighbor to the north, the newly established Jin dynasty (1115–1234), contributed to its commit-

ment to the development of naval and shipbuilding capabilities.

After the loss of the Song capital of Kaifeng to Jin conquerors in 1126, Song leaders retreated below the Yangzi River to reestablish a government in Hangzhou. Protected to a certain extent by natural barriers of rivers and lakes, as well as by agreeing to make annual tributary payments to the Jin to deter aggression, the Southern Song government turned to greater investment in its maritime interests. The Song established China's first permanent navy in 1132, bolstering the protection and improvement of its harbors and major seaports at Quanzhou, Hangzhou, Xiamen, and Fuzhou. The abundance of large merchant ships sailing international trade routes—complete with multiple decks and masts, sails as well as oars, the innovation of compass use, and the ability to carry several hundred sailors—illustrated the technological superiority and advancement of Song shipbuilding.

The Song also enjoyed a prosperous economic and cultural elevation at this time. Earlier improvements in rice cultivation enabled the southern regions to increase both the production and trade of rice, resulting in a significantly larger and wealthier population by the onset of the twelfth century. This in turn produced a growth in city populations as well as commercial contact throughout the region. An increasing number of investors and merchants found leisure and entertainment in fine art, cultivation of intellectual and philosophical pursuits, and refined culinary tastes. This higher standard of living engendered a greater demand for foreign luxuries, and vigorous and widespread Chinese oceanic trade provided them in bulk.

Although overland trade with Song's northern neighbors and those along the Silk Road had long played an important role in sustaining its commerce, oceanic trade surpassed land trade during the Southern Song era. The government sent emissaries to Korea, Japan, and various Southeast Asian countries to invite trade to China. The prevalence of Chinese trade ships in the Indian Ocean rivaled the number of Indian and Arab traders. Sea junks transported massive amounts of goods from the Spice Route along the East Indies. Sumatra and Java supplied so-called long pepper and herbal medicines; ginseng, fra-

grant wood, and quicksilver were among the imports from Korea and Japan; and Arab traders brought pearls, tortoiseshell, frankincense, and rose. Myrrh and cinnabar arrived from Somalia to turn large profits for lucky investors. Cloves and nutmeg were transported from the Spice Islands (Maluku Islands or Moluccas), Indian black pepper from its namesake, and Ceylonese cinnamon from Sri Lanka.

The export commerce of Chinese merchants in the Southern Song era was indicative of an economy that was vastly improved in organization. Large-scale oceanic trade endeavors were known to turn very high profits, but they also posed the possibility of huge losses. The establishment of a shareholder system in which an excursion was financed by several investors provided effective risk management. Production became highly specialized, and in larger cities craftsmen were organized into guilds that became known for the quality of specific goods, such as tea, paper, and rice. The rise in development and production of iron and textiles provided a large source of exports. Traditional Chinese exports such as silk, porcelain, and ceramics were also vastly improved in quality and craftsmanship, creating far-spread demand overseas; remnants of porcelain identified to the Southern Song era have been discovered as far as East Africa.

Burgeoning overseas commerce created ample opportunities for diplomatic ties as well. The volume and prevalence of Chinese trade earned admiration among foreigners. The Moroccan geographer al-Idrisi wrote in 1154 of the impressiveness of Song ships bringing goods to the Euphrates River. Muslim traders who traveled to China were known to have stayed in official advisory roles over economic affairs. The Southern Song government welcomed the revenue gained in import taxes—much of which came from Arab trade—that by this point had become more profitable than the traditional land tax.

The high profile of Chinese trade in the age of Southern Song was largely responsible for the economic prosperity of the region and its partners around Southeast Asia and the Indian Ocean. Some historians believe that the climate of economic cooperation—in lieu of military aggression—as well as mutual prosperity provided

➤ PAPER MONEY

Commerce grew so rapidly that imports into the Southern Song region began to greatly outweigh exports. Copper currency—round coins with holes in the middle that could be tied together on a string—had long been the standard for conducting business. However, as the volume of traded goods increased, so did the number of coins carried on string, up to hundreds and thousands on one string. These became quite a burden to carry and use.

The first use of paper banknotes occurred in China with the “flying cash” of the Tang dynasty (618–907), so-named because of its propensity to fly away. Private merchants were issued transferable certificates for government purchases that could be traded for cash at the capital. However, it was not until the 1120s in the Song dynasty that widely circulating government-issued paper money appeared. With the expansion of the economy in the Southern Song era, there was a need for a less cumbersome means of currency. Additionally, the standardization of paper money freed up copper for use in other avenues of production. As the Yuan dynasty succeeded the Song, the practice was adopted by the government, and printing expanded to the point that inflation necessitated several overhauls of the value system.

—Jennifer Lei

an environment in which an introspective moral philosophy, such as Neo-Confucianism, was able to develop. The long-standing network of trade relations established in this era lasted well after the conquest of the Song dynasty by Khubilai Khan in 1279.

Prester John

In December 1144, the Seljuk Turkish *atabeg* (governor) of Mosul, Zengi, captured the crusader-held city of Edessa. When news reached Pope Eugenius III in 1145, it was accompanied by a report (delivered by Hugh, Latin bishop of Jabala, Syria) about a Christian priest-king in the “Indies,” that is, somewhere in distant Asia, named John. According to Bishop Otto of Freising’s account of Hugh’s report, John was a descendent of the Magi who, after defeating “the Persians and Medes,” had tried to come to the aid of Jerusalem but was unable to cross the Tigris River.

Somewhat later, during the reign of the Byzantine emperor Manuel I Comnenus (r. 1143–1180), a letter began to circulate in Europe addressed to him claiming to be from Prester (Priest) John. In it, he described the glory and extent of his realm, extending over “the Three Indias,” and announced his plan to visit the Sepulcher of Jerusalem and defeat the enemies of Christ. In succeeding decades belief in the leg-

end of Prester John grew, fueled by Europe’s need for an ally in its ongoing conflict with Islam.

In 1177 Pope Alexander III dispatched an embassy to Prester John, seeking to convert him to Latin Christianity, but the embassy never returned. During the Fifth Crusade (1217–1221), a report reached the crusaders at Damietta, Egypt in 1221 that a Christian king of India named David, a descendent of Prester John, would soon join them in the fight against the Muslims. The expected help never materialized, and the crusaders were subsequently defeated by the Mamluk ruler of Egypt.

What were the roots of the Prester John legend? Prester John’s letter incorporated many elements of the *Alexander Romance* and played on European ideas of Asia’s great wealth, fabulous wonders, and grandiose rulers. However, the stories themselves almost certainly originated in the East, probably Central Asia, where many Syriac Christians (commonly called Nestorians) lived. In particular, they may reflect Eastern Christian traditions about the Magi and St. Thomas, both of whom were connected with Prester John.

Prester John himself was modeled on a series of Inner Asian rulers, none of whom were Christians. The historical basis of the 1145 report was probably the defeat near Samarqand of the Seljuk sultan Sanjar in 1140/1141 by the Qarakhitai, refugees from the recently dissolved Liao state of the Khitan (Qidan) Mongols in northern China. Although anti-Muslim, they were Buddhists, not Christians. Another Inner Asian ruler who probably influenced the development of the legend was Küchlüg, a Naiman prince who was raised Nestorian but converted to Buddhism after ousting the Qarakhitai ruler in 1211.

Stories about Chinggis Khan, the Mongol conqueror who defeated Küchlüg (1218) and then the Khwarezm-shah Muhammad (1219–1221) in his steady advance westward, also probably played a role in the development of the legend. Because all three rulers attacked Muslims, Christians who heard these stories erroneously thought them to be fellow Christians. This fantasy was soon abandoned when Mongol hordes subsequently invaded the Middle East and eastern Europe, slaughtering Muslims and Christians alike, until they were recalled eastward in 1241 because of the need to elect a new khan of khans.

Detail from a portolan chart of the Indian Ocean shows Prester John seated on a throne, by Diego Homem, about 1558. (The British Library/StockphotoPro)

Nonetheless, the myth of Prester John hung on, and Europeans who traveled to China kept their eyes open for signs of the elusive monarch. John of Plano Carpini (1247) located him in southern India, whereas William of Rubruck (ca. 1255) associated him with the ruler of the Mongol Naiman tribe, now subservient to Chinggis Khan. Later, Marco Polo (1298) identified him with Unc (Wang) Khan, the Nestorian Christian ruler of the Kerait Turks who was originally Chinggis Khan's mentor but was killed by him around 1200.

Polo also referred to another historical figure as a descendent of Prester John: George, Prince of the Ongut Turks, a vassal of Khubilai Khan, who was later converted from Eastern, or Assyrian (Nestorian), Christianity to the faith and practices of the Roman Church by John of Monte Corvino (ca. 1305). The last attempt to locate Prester John in Inner Asia was around 1328, when Odoric of Pordenone described him as living to the east of Cathay. Both he and Rubruck observed that very little of what was said of this ruler was true, indicating growing pessimism in some quarters about the legendary figure.

Most accounts of Prester John had located him in "India" or "the Indies," which at the time was considered to be composed of Nearer India, Farther India, and Middle India, corresponding to northern India (extending north into Inner Asia), southern India, and Ethiopia. It was now clear that Prester John was not to be found in Nearer India. Marco Polo, visiting the shrine of St. Thomas in southern India en route back home (1290–1291), found no evidence of him there either. The only place left to look was Ethiopia.

European Christendom was well aware that the rulers of Ethiopia were Monophysite Christians. Beginning in 1270, a vigorous new Ethiopian dynasty was founded that claimed to be descended from King Solomon. It is likely that an Ethiopian embassy to Spain around 1310 revived hope in Prester John's existence. By 1324 a Catholic bishop of southern India, Jordan Catalani, was openly equating him with the emperor of the Ethiopians. The Muslim capture of the last major crusader stronghold of Acre in 1291, the conversion of the Mongol il-khanids in Persia to Islam in 1295, and the subsequent rise of two new Turkish powers, the Ottomans in Anatolia

➤ THE LETTER OF PRESTER JOHN

"Prester John, by the power and virtue of God and our lord Jesus Christ, lord of lords, to Emmanuel, governor of the Romans. . . . It has been reported to our majesty that you esteem our excellency and that mention of our High One has reached you. . . . We wish and long to know if, as with us, you hold the true faith and if you, through all things, believe in our lord Jesus Christ. . . .

If you truly wish to know the magnitude and excellence of our Highness and over what lands our power dominates, then know and believe without hesitation that I, Prester John, am lord of lords and surpass, in all riches which are under the heaven, in virtue and in power, all the kings of the wide world. Seventy-two kings are tributaries to us. I am a devout Christian, and everywhere do we defend poor Christians, whom the empire of our clemency rules, and we sustain them with alms. We have vowed to visit the Sepulcher of the Lord with the greatest army, just as it is befitting the glory of our majesty, in order to humble and defeat the enemies of the cross of Christ and to exalt his blessed name.

Our magnificence dominates the three Indias, and our land extends from farthest India, where the body of St. Thomas the Apostle rests, to the place where the sun rises, and returns by slopes of the Babylonian desert near the tower of Babel. Seventy-two provinces serve us, of which a few are Christian, and each one of them has its own king, who all are our tributaries. . . ."

and the Timurids in western Central Asia, once again brought home the need for Europe to have allies against the ongoing Muslim threat.

However, it was not until much later, around 1520, that Portuguese envoys were finally able to reach Ethiopia from the east coast of Africa. Although a member of the mission, Fr. Francisco Alvares, titled his memoirs of the embassy *The Prester John of the Indies*, it was clear to those who had traveled to see the elusive ruler that his

kingdom was nothing like that described in the letter written 350 years before. Shortly thereafter the dream of a powerful Christian king in the East who would come to the aid of his European coreligionists died.

The Western Missionary Presence in the East

Western missionary presence in China, the Middle East, and India roughly paralleled the era of the Pax Mongolica (ca. 1250–1350). The Dominicans, who were already active during the early thirteenth century in the Latin empire of Constantinople and in the Holy Land by 1250, began to push their proselytizing efforts east in the fourteenth century, sending missionaries along the established trade routes by sea as far as southern India and by land into the il-khanid territories in present-day Iran, Iraq, Armenia, and Turkey. The Franciscans established a missionary presence in China in 1294 in response to a specific request by Khubilai Khan (r. 1260–1294) that 100 Latin Christian monks be sent to him at the Mongol court known as Dadu (close by the imperial city of Khanbalik, or City of the Khan; both were located in present-day Beijing). Responding to the presumed success of the mission, the pope in 1306 made the Mongol capital of Dadu/Khanbalik an archbishopric, and over the next four decades the Franciscans established a presence at the imperial court and strengthened the Latin Christian presence in Guangzhou, Yangzhou, and other cities.

In 1318 Pope John XXII formally recognized the de facto split of the eastern territories between the two proselytizing orders but decided

that the Dominicans should supervise their more radical Franciscan brethren. The pope elevated to an archbishopric the Dominican house in Sultanieh, which was located within the Il-khanid empire, and put its new archbishop in charge of all missionary activity in the East. The Franciscans maintained a vibrant, growing presence in China until the ascension of the xenophobic Ming dynasty in 1368. And although the Dominican mission to India was virtually moribund by 1350 and the entire Latin Christian missionary presence in the Middle East was badly depleted during the reign of Timur-i Leng (r. 1370–1405), known in the West as Tamerlane, the Dominicans retained small mission houses in Armenia and Turkey as late as the seventeenth century. The missionary presence of both the Franciscans and the Dominicans in China, India, and the Middle East during this turbulent era had an impact on the emerging art, architecture, and scientific thought of the pre-Renaissance West.

The Franciscan mission to China served a threefold purpose: to convert the Mongols, the Chinese, and various Turkic peoples of the region to the Latin Christian faith; to support the European merchants who flocked to China during the Yuan dynasty (1279–1368); and to act as diplomats between the emperor at Dadu and the pope in Rome (and later Avignon). During the 100-year course of this diplomatic exchange, 1250 to 1350, letters and gifts were regularly exchanged. The pope sent the emperor vestments, manuscripts, and relics and, on one singular occasion, a magnificent gift horse. The emperor reciprocated with rich portable goods from China. The Dominican mission to the Middle East and India had a lasting effect on medical and scientific inquiry in fourteenth- and fifteenth-century Italy. The Dominicans were herbalists of the first order, and the pharmacy of Santa Maria Novella in Florence was famous for centuries. Early missionaries to the East sent back reports filled with descriptions of medicinal herbs and plants and undoubtedly collected many of the rare specimens that are depicted in medical manuals of the era. The Dominicans also had a mission house in the one-time il-khanid capital of Maragha, Iran, where, in addition to a madrasa with a library reported to have hundreds of thousands of books,

► LANGUAGE INSTRUCTION FOR THE ROMAN CHURCH'S MISSIONARIES

The missionary activity of Franciscan and Dominican friars in North Africa and Asia necessitated their learning languages that would enable them to communicate with those whom they sought to convert. A leader in promoting missionary-specific language study in Latin Europe was the Catalan poet, novelist, scholar, university professor, theologian, and mystic Ramon Llull (ca. 1232–1316), who according to a pious tradition died a martyr's death as a result of injuries sustained on his third mission to North Africa. A native of the island of Majorca, which passed from Muslim to Christian Aragonese hands around the time of his birth, Llull had grown up in a culturally complex society in which knowledge of a variety of languages was almost a necessity. He was fluent in his native Catalan and in Occitan (the language of southern France), Latin, and Arabic.

Llull, who was deeply influenced by both Sufi and Franciscan ideals, dedicated the last five decades of his life to the spiritual unification of all humanity, which he expounded in a large body of books in Latin, Catalan, and Arabic. An activist as well as a theorist, he convinced King Jaume (James) II of Aragon (r. 1291–1327) to establish

a short-lived school of Oriental languages for missionaries on Majorca. Llull also openly but unsuccessfully urged the masters of the University of Paris, Latin Europe's premier school, to establish chairs of Eastern languages. His efforts in this latter endeavor appeared to have been rewarded in 1312 when the Council of Vienne, a General Council of the Roman Church that met in southeastern France, mandated that the universities of Paris, Oxford, Bologna, and Salamanca, as well as the papal court, provide six professors each, two for each language, for the teaching of Hebrew, Arabic, and Chaldean. This last language, also known as Syriac and Neo-Aramaic, was spoken by Eastern Assyrian, or Chaldean, Christians in Iraq, Iran, and neighboring areas.

There is often a great gap between ideal and reality, and there certainly was in this case. The decree enjoining the five institutions to establish chairs of Eastern languages went largely unrealized, even by the papacy that had convened and presided over the council. The cause of the failure might have been a scarcity of qualified professors to teach the languages.

—Alfred J. Andrea

a significant astronomical observatory was built between 1260 and 1270 during the reign of Hulegu. The observatory was famous for the work of two Arab astronomers—Kaje Nassir al-din al-Tusi and Muhyi al-din al-Maghribi—who made observations of solar eccentricities and the sun's apogee. Al-Maghribi also translated a number of Greek scientific and mathematical treatises into Arabic, which preserved this ancient body of work from destruction.

The Dominican humanists of the early Renaissance era were keenly interested in the seasonal movements of sunlight, as it determined the date of Easter. It is likely that some of the early scientific work done at the observatory at Maragha (although the structure itself was ruined in an earthquake ca. 1330) informed their thought. Cardinal Bessarion, a scholar-refugee from the Byzantine empire who converted to Latin Christianity, encouraged several humanist

scientists to put their minds to the problem around 1460, and the newly constructed dome of the *duomo*, or cathedral, of Florence in 1475 became the site of one of the first *meridiana* (simply a hole in the ceiling of a large dark building with a rod in the floor that marked the return of sunlight to the same spot every year, signaling the vernal equinox). A *meridiana* was installed in the Dominican church of Santa Maria Novella in 1575.

European Missionaries, Diplomats, and Merchants in East Asia

During the century between about 1240 and 1340, Europeans had an unprecedented opportunity to travel to East Asia. Envoys, missionaries, and merchants regularly visited Mongolia, China, and India and returned to relate new information about the peoples and cultures they encountered. The result was an explosion of knowledge about the wider world and Europe's place within it.

By far the most important factor producing these new conditions was the rise of the Mongol empire. By 1206 Chinggis Khan had turned the nomadic groups of the Mongolian steppes into a formidable conquering army, and by the 1270s his descendants ruled an empire that sprawled from China to Russia and covered much of the Middle East. Europeans got their first experience of this new power in the 1220s when raiding parties struck into Russia. Then, between 1237 and 1241, Mongol armies devastated Russia, Poland, and Hungary, only breaking off their attack at news of the Great Khan Ogedei's death. Though Europeans initially reacted to these incursions with horror and fear, it soon became apparent that a vast new area of the world was now accessible to European travelers.

The first Europeans to venture into the Mongol heartlands were members of the new Franciscan and Dominican orders who shared an ideal of wandering, begging, and preaching. These friars were mobile, well educated, and loyal to the papacy and hence ideal for long-distance missions as papal envoys. The first important embassy to the Mongols was led by the Franciscan John of Plano Carpini, who departed from Lyons, France, in April 1245; reached devastated Kiev by early 1246; and was relayed from one Mongol official to another until arriving at Karakorum, the Mongols' "tent city" in Mongolia, in July. After a five-month stay, John returned to Europe and wrote his *History of the Mongols*, a sober account of the Mongols' customs, morals, origins, religion, and fighting tactics. Another Franciscan, William of Rubruck, made a similar journey a few years later. Departing from the crusader kingdom of Jerusalem around March 1253, he arrived in Karakorum in December 1253 and was

back in the Holy Land by August 1255. His account of his journey, which he presented to King Louis IX of France, while not as widely read as John of Plano Carpini's, was more lively and personal. A number of other mendicants, most notably the Dominican Andrew of Longjumeau, undertook similar diplomatic missions to the Mongols in these years.

What these friars found was a cosmopolitan world in which cultures, religions, and ethnicities converged on the capital of Karakorum. The Mongols valued capable craftsmen, engineers, and administrators wherever they could find them and traditionally adhered to a shamanistic religion that did not preclude considering other beliefs. Consequently, Muslims, Buddhists, Daoists, and Latin, Orthodox, and Assyrian (Nestorian) Christians all competed for favor. William of Rubruck actually participated in a debate among these religious groups and described a number of Buddhist practices to Western readers for the first time. He also provided lively accounts of various Central and East Asian peoples whom he had encountered, such as Uighurs, Tibetans, and Chinese, although he never entered into Tibet or China.

Following in the footsteps of these envoys, European merchants quickly recognized an opportunity for profit. Among the first to venture east, and certainly the most famous, were the Polos, a Venetian merchant family already established in the Black Sea trade. Around 1260 Niccolò and Maffeo Polo set out to trade in Mongol-controlled Russia but were prevented from returning via Constantinople and were forced east by the outbreak of hostilities between Berke, khan of the Golden Horde in Russia, and Hulegu, the il-khan (subordinate khan) of Persia. Three years later the Polos arrived in northern China at the court of Khubilai, the Great Khan, who eventually sent them back to Europe with letters for the pope. In 1271 they set out once more on the long trek east, this time taking with them Niccolò's 17-year-old son Marco. During their three-year trip across Asia (which they broke up with long stays at towns along the way), Khubilai had essentially completed the Mongol conquest of southern China. Thus, unlike earlier travelers, the Polos experienced firsthand all of the wealth and sophistication of Chinese civilization. Some-

time shortly after 1290 they departed with a seaborne mission to Persia via India, traveled overland to the Black Sea, and reached Venice in 1295. Three years later while imprisoned in Genoa and in collaboration with his ghostwriter Rustichello of Pisa, Marco produced the famous account of his travels. The book describes the wealth and power of Mongol China, gives a geographic tour of the Mongol domains with attention to local customs and products, and includes the only Western European mention of Japan in the medieval period. Rustichello's embellishments may be to blame for some of this book's unsustainable claims about Marco's exalted role in the Mongol administration, but, a few modern doubters notwithstanding, the work and its widespread influence rested on Marco's authentic Asian travels.

The Polos were only the most famous of a substantial number of similar Italian merchant voyagers. A number of Genoese and Venetian merchants were in India between 1315 and 1340. John of Monte Corvino and Andrew of Perugia refer to Genoese in Khanbalik (present-day Beijing) and Zayton (Quanzhou) between 1305 and 1326, and the Genoese merchant Andalo da Savignone traveled to China several times in the 1330s and 1340s. Perhaps the most moving evidence for these mercantile contacts is the tombstone, discovered in 1951, of Caterina Vilioni, who died at Yangzhou in 1342. The Vilioni were a well-established Venetian merchant family with connections across the Mongol world, apparently secure enough in China to have at least one young female member of the family there.

The Mongol conquests also afforded Latin Christians new opportunities for missionary work, most spectacularly the mission undertaken by John of Monte Corvino, first Catholic bishop of China, and his Franciscan brethren. Another Franciscan, Odoric of Pordenone, traveled through Iran, India, and Southeast Asia to reach Khanbalik in 1325 and returned overland to Europe by 1330. His account of his travels is entertaining but filled with improbable marvels and rumors. Nevertheless, his wide-eyed account of the glories of the Great Khan's capital of Daidu (or Dadu) and the great seaport city of Hangzhou ring with authenticity. At the same time,

➤ JOHN OF MONTE CORVINO

The career of John of Monte Corvino (ca. 1247–ca. 1330) is one of the most interesting of the entire medieval era. An Italian Franciscan, John was a missionary to the Mongol-controlled Middle East in the 1270s. In 1289 he was named by the pope to head a delegation to Mongol China. John traveled east through Iran and then by sea from the Persian Gulf to India, finally reaching Khanbalik (present-day Beijing) by 1294. There he had some success convincing local Nestorian Christians of Turkic ethnicity to embrace Latin Christianity and was able to build a new church, translate the New Testament into Mongol script, and baptize about 6,000 people (or so he claimed). The pope, learning of John's successes, named him the first Catholic archbishop of Khanbalik in 1307 and sent Franciscan reinforcements. Three of these friars successfully reached China in 1313 and were appointed John's suffragan (or subordinate) bishops. John had in the meantime moved south to Zayton (Quanzhou), where he led a small flock of Western Christians until his death around 1330. A number of poignant letters from John and his companions survive, revealing both the facts of their mission and the recurring sense of isolation that enveloped them as they ended their days so far from home.

—Sean Field

the Dominican Jordan of Séverac traveled widely in the Middle East and India, where he was named first bishop of Quilon in 1329. Thus, for a time in the early fourteenth century, the Church hoped to incorporate the vast expanses of Asia into its diocesan structure. Although by 1330 these contacts were becoming increasingly precarious, the era of Franciscan travelers to China was not quite over. John of Marignolli was sent in 1338 to Beijing to assess the situation and reported the continuing existence of Franciscan houses in the southern seaport city of Quanzhou. On his return voyage through India in 1346 he found Dominicans still ensconced in Quilon. As late as 1412 popes were still attempting to name archbishops of Khanbalik.

Such hopes were by then illusory, however, for the conditions that had allowed relatively safe travel across such a wide area were coming

to an end. When the Florentine merchant Francesco Balducci di Pegolotti wrote around 1340 that the route to Cathay was quite safe, he may have been stretching the truth only a bit.

The Mongol empire was still theoretically a single entity up through the early fourteenth century, but increasingly the reality was one of regional powers in conflict with each other. This disintegration was hastened by religious conversions; Mongol leaders in the east adopted Buddhism, while those in the west converted to Islam. As these rival leaders turned on each other, the fearsome military power of the Mongols began to decline. The il-khans in Persia were deposed around 1335, and the last Mongol ruler of China was overthrown in 1368. Though Mongol overlords continued to control parts of Russia and Central Asia into the fifteenth century, the age of Mongol dominance was over.

In spite of its brevity, this era was of immeasurable importance to European perceptions of the world. It was now apparent that the Latin West was only a small corner of the known world and that it was vastly inferior in terms of wealth and power to the teeming cities of the Far East. Christianity, moreover, was revealed to be the religion of only a small number of people when compared to the Muslim, Buddhist, and Hindu populations of Asia, especially China and India. In addition, one of the great surprises for Latin travelers in Asia was the discovery of extensive Eastern, or Assyrian (Nestorian), Christian communities paying allegiance to neither the pope in Rome nor the patriarch in Constantinople. As a result, the centrality of Latin Christianity itself was cast into doubt. At the same time, at least a few people like William of Rubruck realized that when compared with Eastern traditions such as Buddhism, Christianity and Islam shared a great deal, having emerged from the same Western, Abrahamic tradition. On the other hand, the general lack of success for missionizing efforts led to new claims that Muslims and Asians in general were irrational and stubborn.

European travelers in the Mongol empire bequeathed to the West new images of the fabulous wealth of China, examples of the enticing possibilities and frustrating limits of Christian missionizing, and self-justifying claims about the

irrationality of the “Orient.” This mental picture accompanied Christopher Columbus as he sailed west to find the land of the Great Khan and informed the early modern contacts between Europe and the rest of the world.

The Franciscan Origin of the Image of Child-giving Guanyin

It took several centuries and vast cultural upheavals in China before the Buddhist image of the benevolent male guide of souls—the bodhisattva Avalokitesvara—evolved into the distinctive folk goddess of mercy, Guanyin. It is important to note that Avalokitesvara (“The One Who Hears the Cries of the World”), known as Guanshiyin or Guanyin in Chinese, was always understood to be masculine within the Indian scriptures, although androgynously so. In China, however, Avalokitesvara/Guanyin underwent a sex change. Ever since around the Sui dynasty (589–618), Guanyin had been represented in female as well as male form, and by the time of Southern Song (960–1126/27) the female form predominated. Inasmuch as the *Lotus Sutra*, the main text for this bodhisattva’s cult, stated that Avalokitesvara/Guanyin would assume any form in order to save a devotee, this shift between sexes presented no problem to believers. Moreover, even in his male form, the bodhisattva’s power to grant children was clearly stated in the *Lotus Sutra*, and as early as the eleventh century miraculous births of children were being reported

White-robed Guanyin holding a child, about 1420, detail of a stele with inscribed text attributed to the poet Qin Guan (1049–1100). From *Lidai Guanyin Baoxiang Minghua*, vol. 2, no. 144. (Chun-fang Yu. *Kuan-yin: The Chinese Transformation of Avalokitesvara*, 2001)

after prayers to him/her. This creative power passed easily to the unmistakably female form, with Guanyin extolled as Perfect Wisdom, “the mother of bodhisattvas.”

One particular form of Guanyin arose during the turbulent years of the transition from the Song to the Yuan dynasty. The divinity appeared—as a woman—in a dream to a pilgrim on the island of Putuo off the coast of China in 1276. Coincidentally, around the year 1300, just as this womanly Guanyin was receiving widespread attention and was being prayed to locally for sons, the Christian image of the Madonna of Humility was introduced into the same area by Franciscan missionaries from Italy.

The largely forgotten Franciscan mission to China (ca. 1300 to 1400) is well documented in both Western and Chinese sources. They established schools and churches in the Mongol capital of Dadu (present-day Beijing) and in all the major cities on the southern seacoast of China that were visited by European merchants, and archaeological evidence of their presence has been found in several cities. In the city of Yangzhou a grave marker excavated in 1951 was discovered

➤ FRANCISCAN GUANYIN

Tombstone of Catarina Vilioni, 1342. (Ricci Institute for Chinese-Western Cultural History, University of San Francisco)

By the fifteenth century, medieval Christian devotional images had helped local artists visualize and transform White-robed Guanyin into a distinctly Chinese depiction of the Child-giving Guanyin. By the time the Jesuits arrived in the late sixteenth century, the early Christian context had been completely subsumed into a uniquely Chinese image.

—Lauren Arnold

to have Latin script and Franciscan imagery carved on it. Dated to 1342, the marker testified to the life and death of Caterina Vilioni, whose father Dominico had been an Italian merchant living in the city.

No images of the Child-giving Guanyin are known before the year 1400. The Yangzhou Madonna of 1342, then, can be understood as a link between the evolution of images of the goddess Guanyin in her many roles. Popular images of Guanyin—who had always been prayed to for children—by 1400 were being overlaid upon images of the seated Madonna tenderly holding her son, becoming a melded but distinctly Chinese depiction of Guanyin in her child-giving role. These early-fifteenth-century images no longer had overt Christian overtones, as the Franciscan presence on the southern coast was largely diminished and underground if not extinct by this time due to a Ming governmental ban on Christianity as a foreign religion. But the evolved image of Guanyin is clearly based on the Franciscan prototype, when compared with the carvings on the Yangzhou tombstone of 1342.

By the time the Jesuits landed on the southern seacoast of China in the 1580s, all memory of the Franciscan mission to the very same area had been lost. Without this knowledge, the Jesuits expressed surprise that images with a distinctly Marian flavor were already being worshipped locally when they arrived. The leader of the Jesuits in China, Matteo Ricci, went to his grave never knowing that his brother Franciscans had ever set foot in the country, let alone had thousands of converts. Yet the images that Ricci saw—the Child-giving Guanyin that resonated as the Madonna and Child in his eyes—were truly the fruits of the Franciscan effort before him. Ricci was seeing not only a transformed and locally distinct image of Guanyin but also a relic of medieval European presence.

Artistic Exchange between East and West during the Mongol Era

Dante, Boccaccio, and Chaucer all mention the astonishing beauty of objects brought back to Europe from China, the Middle East, and India. Certainly, Giotto, Simone Martini, Ambrogio Lorenzetti, and many other artists of their time were equally aware of and influenced by the lure of the East: Mongol and Indian faces peer out of altarpieces and church frescos of the period, angels and saints wear robes of recognizable Chinese and Persian silks, and the Madonna stands upon exquisite oriental carpets. The presence of these Eastern items in religious paintings speaks not only to merchants moving along the trade routes but also to Latin Christian missionaries traveling along them. The Mongol descendants of Chinggis Khan—founders of the Yuan dynasty in China (1279–1368) and the Ilkhanid dynasty in present-day Iran and Iraq (1256–1353)—at varying times actively welcomed or at least tolerated Western missionaries within their territories. The presence of the Franciscans in China and the Dominicans in the Middle East and India during the Pax Mongolica (ca. 1250–1350) virtually ensured that Eastern influences would find their way back to churches in the West. Art created for the missionary home churches in Assisi and in Florence at Santa Maria Novella in particular underline this Eastern contact in fresco cycles, altarpieces, and illuminated manuscripts.

The Franciscan mission to China was the conduit to the West of gifts from the emperor of China, many of which entered the papal treasury beginning in the late thirteenth century. Over a hundred items specifically labeled “Tartarico” are cited in the papal inventories of 1295 and 1314. Most are luxury goods such as silk, metalwork, and other precious, easily portable commodities, but listed among them is a *papirum tartaricorum* (Tartar scroll), presumably a painted scroll of late Song or early Yuan fabrication. Chinese paintings of that era were distinctive for their atmospheric natural landscapes

The mountainous background in this fresco can be seen as a hesitant interpretation of a late Song/early Yuan Chinese landscape scroll. (Giraudon/The Bridgeman Art Library)

and their voluminous solid figures. Such a scroll in the hands of Giotto and his contemporaries would have had a penetrating influence on this generation of artists, who were rapidly distancing themselves from the *maniera greca* (Greek, that is Byzantine, style) of their mentors. The rocky landscapes and the weighty figure forms so similar to Chinese exemplars are particularly evident in works painted by Giotto and Simone Martini (who were completing fresco cycles at Assisi in anticipation of the Jubilee of 1300) and in a fresco by Ambrogio Lorenzetti several decades later at the Church of San Francesco in Siena.

The Dominican mission to the Middle East and India was supported by a series of active mission houses and scriptoria (centers for book production) established in major cities along the eastern trade routes. Dominicans are documented in Nachivan in Greater Armenia; in Mo-

sul and Baghdad in modern-day Iraq; in Tabriz, Maragha, and Sultanieh in Iran; and in the southwestern Indian port city of Quilon in Kerala Province. Many of these cities, especially Tabriz, Mosul, and Baghdad, had renowned Muslim scriptoria, and there is strong evidence of cross-fertilization of imagery among the illuminators. For example, images of the Apotheosis of St. Thomas Aquinas (especially in the Dominican chapter house in Florence and elsewhere) are strikingly similar to Muslim illumination archetypes of the enthroned king. Conversely, the *Birth of the Prophet*, painted circa 1330 in Tabriz, Iran, where the Dominicans had a mission house, has long been noted as clearly based upon a Western prototype, the *Nativity of Christ*.

The introduction of certain Eastern architectural techniques into the West may also have been fostered by missionary contact. The il-khanid capital of Sultanieh, site of the domed mausoleum of Oljeitu (r. 1304–1316), completed by 1313, was also the seat of the Dominican archbishop, who was in regular contact with his superiors in Florence. Given the significant presence of the Dominicans in both cities, the extraordinary dome of Oljeitu's tomb must be considered as a possible influence on the one that Brunelleschi (1377–1446) designed for Florence's *duomo* (cathedral church), begun in 1420. Certainly, Florence's double-shelled dome, with its unusual interlocking herringbone brickwork reinforcing the interior shell—both characteristic of medieval Islamic mosques and tombs—is virtually unique in Europe at the time.

There is evidence that the Franciscans and the Dominicans, their missionary work in the East facilitated by portable illuminated manuscripts and small painted and carved altarpieces, left a lasting artistic influence there as well. Franciscan sources are probably the origin of the image of the Child-giving Guanyin. There are also archaeological data that indicate Franciscan architectural activity in a temple complex that survives in the Nanjing area.

Two Fourteenth-Century Friars' Accounts of the Wonders of Asia

The mid-fourteenth century saw the creation of a new genre of illustrated writings in Western Europe—the travel compendium—that grew out of the reports of wayfarers and missionaries who went to the East. More than 100 examples of illustrated travel compendia have survived in manuscript form. Each was unique and pictorially rich and drew from a variety of sources. Nevertheless, they shared a common core: the tales of their respective trips to China as reported by Fra (Friar) Odorico da Pordenone and Marco Polo.

Odorico's and Polo's widespread popularity was possibly due to pure serendipity: the equally vivid account of Jordanus de Severac, a contemporary of Odorico who traveled in India and the Middle East during the 1320s, was filed away soon after it arrived in Europe and remained relatively unknown until the nineteenth century.

Odorico da Pordenone

Odorico da Pordenone (also known as Blessed Odoric of Pordenone, ca. 1265–1331) was a Franciscan who wandered the mission fields of southern Russia, Persia, and India before arriving in China, where he assisted Archbishop John of Monte Corvino. Fra Odorico arrived in Censcalan (Guangzhou, or Canton) on the southern coast of China around 1322–1323, bearing the bones of several Franciscans who had met martyrdom in Tana (present-day Azov in Ukraine). These he took for burial to Fra Andreas of Perugia, the bishop of the city of Zaiton (Quanzhou), where the Franciscans had two churches. Odorico was eager to travel in Mongol-dominated China. According to Odorico, "Having stayed for some

days we set out and arrived at a wonderful city called Kampsay (Hangzhou), which in our tongue means to say 'City of Heaven.' This city is the largest that there is in all the world." He was enthralled by cosmopolitan Hangzhou, where he was treated as an honored visitor by some of the wealthy Christian converts. From there he traveled on to the new imperial court of Dadu (Great Capital) just outside the city of Khanbalik (present-day Beijing), very likely making this long trip at least in part by barge on the Grand Canal. The dynastic upheavals of 1323 do not seem to have restricted his travels in any way.

Odorico spent three years at Dadu with his highly placed Franciscan brothers, who had "an assigned place in his [the Yuan emperor's] court" and where "it is always our duty to go and give him our blessing." According to Odorico, in return the emperor treated the Latin missionaries with high regard.

Following his return to Italy around 1329–1330 and very shortly before his death on January 14, 1331, he dictated an account of his travels, known simply as the *Report*. Because of its rich detail, it became one of the most widely read travel accounts in fourteenth- and fifteenth-century Europe. Odorico was a credulous and gullible listener when reporting hearsay from fellow travelers, but he was a first-rate reporter when describing what he had observed. For that reason, the most compelling portions of his report are his wide-eyed descriptions of enchanting Hangzhou and of the Yuan emperor's court. Odorico's tales of the opulence of China and of the rest of "the Indies" was, along with Marco Polo's account, instrumental in fixing within the European imagination a picture of the unimaginable riches that awaited those bold enough to reestablish contact with the Great Khan.

Jordanus de Severac

The Dominican Jordanus de Severac (also known as Jordan of Severac, ca. 1296–1331) traveled extensively throughout the Middle East and India in the first decades of the fourteenth century, and around 1330 he recorded his recollections in *Mirabilia Descripta* (often loosely translated as "The Wonders of the East"). Unlike Franciscan accounts of the East, Jordanus's version is filled

with descriptions of medicinal plants and animals of interest to his healing brethren, the Dominicans of Florence, who were famous for their pharmacological work.

Jordanus was a vivid observer and described India in great detail and with genuine delight. The coconut palm, he wrote, produces “a very large fruit, as big as a man’s head . . . and both flowers and fruit are produced at the same time . . . so there are flowers and fruit in eleven stages of growth to be seen together. . . . A wonder! And a thing which cannot be well understood without being witnessed.” Of the coconut he says: “The kernel at first is very tender and pleasant to eat [with a milk from it] as good as milk of almonds; and an oil is made from it [the kernel] of great medicinal virtue. . . . The fruit is that which we call *nuts of India*, and from the rind of that fruit is made the twine with which they stitch their boats together.” He also observed the fearsome crocodile, and parrots enchanted him because they were “quite different from what are found on this side of the world. When tamed and kept in cages, [they] speak so that you would take them for rational beings. . . . The birds of this India seem really like creatures of Paradise.” Elephants and bats equally fascinated him, as did curious customs.

Jordanus reported on the Indian custom in which the wife of the deceased would willingly walk into the cremating fire consuming her husband’s body. As a Dominican sensitive to heresy, he was also disturbed by the customs of the Parsis, descendants of Iranian Zoroastrians, who worshipped fire, believed in two conflicting First Principles (Good and Evil), and exposed the bodies of their dead in roofless towers where they would be consumed by birds.

It has been conjectured that Jordanus either went to Tibet or was the recipient of a first-person account of its religious customs, which he reports in some detail. His account of Chaldea (Iraq) was less admiring than that of India, and he visited the ruins of Babylon, just south of the great city of Baghdad, where nocturnal sounds produced such a state of terror that “one would not dare to pass a single night there, even with a great army.” Yet because he was interested in all things medicinal, pools of black liquid farther to the north drew his interest: “whence

➤ FRIAR ODORICO DESCRIBES THE RICHES OF DADU

“I passed through many cities . . . before arriving at the noble city of Khanbaliq, an exceedingly . . . ancient city in . . . Cathay. The Tartars (Mongols) took the city and then built another one-half mile away, which they called Taydo (Dadu). This second city has 12 gates, spaced two miles apart from one another. A large population resides between the two cities, and together the cities have a perimeter that extends more than 40 miles. The Great Khan resides in this city and has a great palace, the walls of which are a good four miles in circumference. . . . For this palace . . . is vast and beautiful. Its ground floor is raised about two paces (6 feet), and inside are 24 columns of gold. . . . In the center of the palace there is a great cistern, more than two paces in height, totally fashioned out of a single precious stone called *merdacas* [jade]. It is bound all around in gold. . . . This cistern also has a hanging network of great pearls that fringe it, and these fringes of pearls are a good yard wide.”

Zheng He's Voyages

The voyages of Zheng He (1371–1433) represent one of the most significant ventures in exploration ever undertaken by the Chinese. Under orders from the Yongle (Perpetual Happiness) emperor of the Ming dynasty (r. 1402–1424), Admiral Zheng He carried out a series of important voyages to Southeast Asia, South Asia, Arabia, and Africa in the early fifteenth century. The voyages took place in an era of expanding trade for the Chinese and also served as a demonstration of imperial power.

Zheng He was born as Ma He into a mixed family of Muslim Chinese descent and was raised in Yunnan. He was reported to be of great physical stature and handsome in appearance. When a Ming military expedition captured Yunnan, he was taken captive and made a eunuch of the imperial court. Ma He initially was a page to Prince Zhu Di (1360–1424) and served the prince in a number of battles. For his faithful military service, Ma He received the honorific name Zheng, possibly for his bravery at a battle at Zhenglunba. When Zhu Di became the Yongle emperor, he continued to place trust in and use to advantage the services of Zheng He.

The Yongle emperor was an activist. In a series of military campaigns, his armies pushed out the Mongols to the northwest and also expanded Chinese dominion southward into Annam (present-day Vietnam). The emperor also moved the capital from the southern city of Nanjing to the north, where he established the Forbidden City in Beijing in 1421. He is also famous for commissioning an important compendium of classic Chinese texts, the *Yongle Dadian* (*Yongle Encyclopedia*), a work that included information on everything from medicine to agriculture to astronomy.

It was in this context of imperial expansion and learning that the emperor ordered Zheng He's education, sending him to Nanjing Taixue (Imperial Central Academy) and later tasked him with leading naval expeditions into the Indian Ocean.

The first expedition began in 1405, with Zheng He leading a massive fleet of some 300 ships and more than 25,000 men. There were six subsequent voyages, each one venturing farther west. The fleet included some of the largest vessels then in existence and brigades of soldiers for any possible military engagements, as well as for ceremonial purposes. The expeditions served a number of functions: diplomacy and a show of power, particularly the desire to bring to many of these foreign lands a reassertion of presumed Chinese hegemony; reestablishment of the trade ties China had enjoyed before and during the era of Mongol rule; scientific activity, which included the search for new flora and fauna for medicinal and other purposes; and the exploration and charting of areas of which the Chinese had no certain knowledge. Finally, there was also the declared objective of finding the Yongle emperor's predecessor, whom he had driven from the throne and whose body had never been discovered.

Zheng He's fleet comprised a number of different kinds of ships. These included treasure ships, for the imperial envoys and key officials, and horse ships that carried tribute goods as well as horses and equipment for the fleet. Supply and water ships carried food and water for the fleet. Military support was maintained by troop transport ships and warships, the latter of which carried cannons, rockets, and mines. The largest ships in Zheng He's fleet were said to have been over 400 feet (122 meters) in length, although this size has been recently disputed.

Zheng He's first voyage (1405–1407) proceeded south and west, reaching Java, Sumatra, Ceylon (Sri Lanka), and finally the southwestern, or Malabar, coast of India. Zheng He's fleet battled pirates in the Strait of Malacca and brought back captives to Nanjing, where they were executed. The second voyage (1407–1409) went to present-day Thailand and again India, where the Chinese helped to install a new raja of Calicut.

► CLAIMS OF GAVIN MENZIES

On March 15, 2002, Gavin Menzies, a retired Royal Navy submarine commanding officer, delivered an address in London declaring that a Chinese fleet, led by Zheng He, had reached America seven decades before Columbus. Later that same year, Menzies' *1421: The Year China Discovered the World* was published in Britain. An American edition quickly followed with a slightly modified title: *1421: The Year China Discovered America*.

Menzies, in fact, made a broad variety of claims about the extent of early Chinese explorations. He claimed that they reached Australia in this same period, that they had navigated the Straits of Magellan well before Magellan was born, and so on. His "evidence" was, however, sparse and poorly organized; Menzies ignored key Chinese texts, misinterpreted early maps, and assembled an odd hodgepodge of questionable archaeological evidence to support his arguments. Meanwhile, a series of earlier careful studies of Zheng He and Chinese maritime explorations went unnoticed outside academic circles.

After the appearance of his book, Menzies continued to make, through his web site and public appearances, further claims and strove to rally support for his contention that the Chinese reached the Americas before Columbus. In a review of Menzies' book, the historian Robert Finlay commented that "Menzies . . . laments that China did not become 'mistress of the world,' with Confucian harmony and Buddhist benevolence uniting humankind. Instead the cruel, barbaric West, secretly and fraudulently capitalizing on Chinese achievements, imposed its dominion around the globe."

In fact, prior to Menzies, there were a number of claims that the Chinese reached the Americas

before the Europeans. In 1761, the French scholar of Chinese culture Joseph de Guignes (1721–1800) put forth the idea that the Buddhist monk Hui Shen had reached America in the fifth century CE. Other writers in France, Germany, and the United States further promoted these speculations. These claims, too, were sometimes based on the conception of the Chinese as somehow kinder, gentler investigators of new worlds and other peoples, especially when contrasted with the Spaniards, Portuguese, and English and their militaristic histories of exploration and conquest. The China scholar Joseph Needham argued that the motivations for the Chinese explorations were scientific, not capitalistic. But such assumptions betrayed a manipulation of the historical evidence and Needham's Marxist ideology. Finlay points out that we should not ignore "the ambitions of the Chinese emperor [who sent out Zheng He's fleet], the commodities carried in the junks, and the army which marched ashore in every port." Most recently, the speculations of Gavin Menzies have been ably debunked by Geoff Wade, a scholar at the National University of Singapore, and by Captain Philip J. Rivers, a master mariner and a far better interpreter of naval charts and waters than Menzies.

This has not, however, stopped Menzies' assault on history. In 2008 he produced an equally outlandish sequel, *1434: The Year a Magnificent Chinese Fleet Sailed to Italy and Ignited the Renaissance*. As the reviewer for *China Journal* wrote, "But what we're already wondering is what Menzies is planning next. Perhaps '1447: The Year Zheng He Became the First Man on the Moon.'"

—Benjamin B. Olshin

The third voyage (1409–1411) explored the islands and coastal regions of Southeast Asia, the southwestern coast of India, and again Ceylon. The fourth expedition (1413–1415) saw the fleet divide up, with some ships carrying out further explorations of the islands and coastal regions of Southeast Asia while others sailed as far as Ormuz (Hormuz) in the Persian Gulf. During this fourth voyage Zheng He's fleet, on imperial or-

ders, restored the rightful king of Samudera (modern Aceh Province in Sumatra). Zheng He routed the usurper Sikandar and his forces; Sikandar himself was taken to China in 1415 and later executed.

This fourth expedition also led to closer contact between China and the greater Muslim world and the subsequent arrival in Nanjing of ambassadors from the East African city-states of

Mogadishu and Brawa (in modern Somalia) and Malindi (in present-day Kenya). They were returned home courtesy of another Chinese expedition that set out in 1417. This fleet again split into two groups: one sailed to Java, Brunei, and the Ryukyu Islands that extend between Japan and Taiwan, while the other explored the Persian Gulf and the northeastern Horn of Africa. On the fourth expedition, one part of the fleet went to Bengal and brought a giraffe back for the emperor. This event is recorded in a still extant painting by a Chinese court artist Shen Du (1357–1434). The giraffe had been given by Saifuddin, the sultan of Bengal, who in turn had received it from the king of Malindi. A later voyage (1421–1422) continued explorations of the coasts of the Arab world and East Africa.

Meanwhile at home, changes were taking place. In 1424, the emperor died; his son and successor, Zhu Gaozhi, terminated overseas exploration. However, this emperor died the following year and was succeeded by the Xuande emperor (r. 1426–1435). Under his reign, the last of the expeditions of Zheng He set out. This fleet, numbering some 300 vessels, left in 1431 and went on to establish diplomatic and trade relations with many kingdoms and territories. The expedition went to many places that the earlier voyages had visited, including Java, Malacca, Sri Lanka, and India; part of the fleet went to Africa. Zheng He, around 62 years old at this time, died on the return voyage in 1433 and was buried at sea.

Zheng He's final expedition returned to China in that same year, and two years later the emperor died. Although China continued its trade and contacts throughout Southeast Asia, it never again sent out state-sponsored expeditions on the scale of the grand voyages of Zheng He. A struggle had shaken the imperial court following the deaths of the Yongle and Xuande emperors, who had supported maritime ventures. Now others in the court, citing Confucian teachings against mercantilism as well as the prohibitive cost of the expeditions, won out. Chinese naval power waned.

There are extant Chinese and Arab sources for the voyages of Zheng He. One of the earliest was the 1434 *Xi yang fan guo zhi* (*Record of the Foreign Countries in the Western Ocean*) by

Gong Zhen, a military officer who sailed on the seventh and final voyage. The *Ying ya sheng lan* (*Overall Survey of the Ocean's Shores*), written by Ma Huan, a Chinese Muslim interpreter who had also been a member of Zheng He's staff, appeared in 1451. There was also the *Xing cha sheng lan* (*Overall Survey of the Star Raft*), written in 1433 by Fei Xin, another officer in the fleet; the book is a mixture of firsthand accounts and secondhand reports. The star raft of the title refers to the ship in the fleet assigned to carry the imperial ambassador. A navigational chart of part of Zheng He's voyages, preserved in Ma Yanyi's seventeenth-century *Wu bei zhi* (*Treatise on Military Preparations*), includes many details such as ports, islands, bearings, and sailing distances as well as hundreds of place-names. Unfortunately, Zheng He's logs are lost, apparently destroyed in 1477 by a minister who wished to prevent China from embarking on another series of such "wasteful" expeditions.

European Voyages into the Atlantic

In the early fifteenth century, merchants, fisherman, sailors, and pirates of various nationalities regularly sailed the waters of the eastern Atlantic Ocean. Sometimes they ventured farther. For centuries there had already been regular Norse and English traffic to Iceland and Greenland, although the Norse Greenland colonies were dying out. The Greenland Western Settlement passed away probably around the mid-fourteenth century and the Eastern Settlement sometime after 1409, the last recorded date of contact between the colony and Scandinavia. The Canaries had been reached for slave raiding, and the other Atlantic islands, the Azores and Madeira, had been reached and named. Evidence indicates that the Canaries were sighted by Genoese sailors in 1271 and 1321 and visited around 1336 in an expedition led by the Genoese Lancelotto Malocello, who was in the service of the Portuguese. Madeira and the Azores were also reached probably before the mid-fourteenth century, apparently also by Genoese sailors serving the Portuguese. However, these early discoveries were not exploited, memory of the exact location of the islands was lost, and it was only after 1400 that they were rediscovered and finally settled. There was hope too that one day maritime explorers would find what would eventually prove to be but legendary places such as St. Brendan's Island, Antillia, and the Island of the Seven Cities. By the end of the fifteenth century, however, technological breakthroughs and dogged exploration, especially by the Portuguese, led in the long run to mastery of the Atlantic and the discovery of the New World and the sea route to India and beyond.

The North Atlantic was first mastered by the Irish. Without compass or chart, they managed by dead reckoning to reach the Faroe Islands and then Iceland—halfway across the Atlantic—as early as the eighth century. The Vikings soon followed. By 900 as many as 2,000 settlers a year were traveling to Iceland; it was the first great era of Atlantic exploration and colonization. By the late tenth century the Norwegians had set up colonies in Greenland, and around the year 1000 they became the first Europeans to reach the coast of North America.

During Western Europe's High Middle Ages (1000–1500) trading, farming, and fishing communities were set up in Greenland and Iceland, visited not only by the Norse and the Irish but also by the English, the Germans, and the Dutch. And although the Greenland settlements were finally abandoned, knowledge of how to get there was never lost. By the early fifteenth century sailors from Bristol were conducting regular voyages to Iceland, Gascony, Spain, Portugal, Ireland, and probably Madeira and the Canaries. In the popular imagination, the Bristol sailors' contribution to navigation and shipping in the Atlantic has been largely overshadowed by the voyages of the Spaniards and the Portuguese to the south, but in all likelihood mariners from Bristol had reached the fisheries of Newfoundland a good generation before Columbus made landfall in the Caribbean.

Farther to the south under the auspices of Prince Henry of Portugal, exploration of the Atlantic proceeded in fits and starts. Although the Azores, the Madeiras, and the Canaries were known in the fourteenth century, the first prolonged attempts to chart and colonize them were made in the fifteenth century, especially by the Portuguese. Contrary to popular opinion, Henry was not aiming at a sea route to the Indies. Rather, his interest, while often couched in crusading terms, was trade and conquest. He was particularly obsessed with the Canaries, which in 1402 the Spanish kingdom of Castile had begun trying to colonize and conquer from the native Guanches, a hunter-gatherer people. This Spanish enterprise can be viewed as the first of Europe's colonial conquests in the Atlantic world since the Viking age. Beginning in 1424 Henry launched a number of ill-fated expeditions aimed

► PRINCE HENRY THE NAVIGATOR

Prince Henry of Portugal, called “the Navigator” by the English (but not by the Portuguese), is regarded as one of the initiators of the great age of discovery. (Corbis)

Known today as “The Navigator,” Prince Henry (1394–1460) was the third son of King João I and Philippa of Lancaster, the daughter of John of Gaunt. Henry’s adult life centered on two preoccupations: Portugal’s explorations along Africa’s west coast and crusading expeditions against Morocco, an Islamic power only miles from Portugal’s shores. It is generally believed that Henry had a major hands-on role in the explorations

and navigational innovations, but this was not the case. He did not participate in any voyages, and there is no evidence that he opened any navigational school. He was, however, the main financier of the sailors and ships that undertook these voyages. He also was instrumental in convincing his brother, King Duarte I, to embark on several

expeditions against Morocco in his single-minded desire to achieve a Christian victory over Islam. This mind-set even led him to sacrifice his own brother Fernando to the enemy in order to hold on to Ceuta, a key Moroccan port city, after a disastrous expedition to Tangiers in 1437.

Funding for these expeditions came from two chief sources: (1) the Order of Christ, the Portuguese successor to the Knights Templar that Henry became grand master of in 1420, and (2) the “royal fifth” he was granted by King Duarte, which guaranteed Henry one-fifth of all profits from trade in the lands he discovered. He was also given a monopoly on all expeditions that sailed beyond Cape Bojador along the present-day Western Sahara, the southernmost region known to European sailors at the time. In 1434 Gil Eanes commanded an expedition funded by Henry that rounded the cape. Trips along the African coastline continued, and in 1444 Portugal was finally able to outflank Muslim trading routes across the Sahara and bring gold and slaves back to Portugal by sea. During Henry’s lifetime the islands of the Azores, Madeira, and Cape Verde became Portuguese possessions, and within 30 years of Henry’s death Bartholomeu Dias rounded the Cape of Good Hope.

—Monique Vallance

at wresting the Canary Islands away from their native inhabitants and the Spaniards. By the last decade of the fifteenth century the Spaniards had succeeded where Henry had failed and finally achieved victory over strong Guanche resistance. The Portuguese successfully colonized the islands of Madeira and Porto Santo, where they grew wheat, grape vines, and sugarcane; cut timber; and harvested dragon’s blood, a valuable tree resin used in dyeing and for medicines. To work their sugar plantations the Portuguese introduced slaves from Africa, thereby anticipating the great slave-labor plantations of Brazil and the West Indies.

In 1434 Henry’s men finally reached Cape Bojador, on the Guinea coast. It was an important psychological and navigational barrier, for this was the point beyond which, Arab and European geographers agreed, it was not safe to nav-

igate. From there discovery proceeded apace as Henry’s men for the first time sailed into uncharted waters. By 1444 they had reached the Cape Verde Islands, which are as far from Lisbon as Newfoundland is from Bristol (approximately 2,000 miles or 3,200 kilometers).

By the mid-fifteenth century, charting the west coast of Africa and setting up trading stations had become a regular business. Mariners, who were given licenses of exploration by the Crown, returned with cargoes of slaves and gold as well as oryx skins, gum, wax, palm oil, ivory, ostrich eggs, and civet cats, which produced a highly prized musk.

Although Henry died in 1460, the Portuguese continued their voyages of exploration. Private investors leased from King Afonso V rights to the Guinea enterprise in return for a fixed rent and the promise to explore 100 leagues (300 miles

or 480 kilometers) of coast annually. By the reign of João II (r. 1481–1495), the Crown itself was financing voyages of discovery. From 1483 to 1487 the navigator Diogo Cão explored nearly 1,500 miles (2,400 kilometers) of unknown tropical coast, erecting along the way stone columns to mark his progress and placing the last one just north of the Tropic of Capricorn in what is today Namibia. That same year Cão's successor, Bartolomeu Dias, left Lisbon on the historic journey that would take him around the Cape of Good Hope and open the way to India.

European Travelers to South Asia before 1498

Until the opening of a sea route to India in 1498, Europeans received only occasional and intriguing reports (often a mixture of facts and fiction) about South Asia from returning individual merchants and missionaries. Although direct trade between the West and India had flourished during the Roman empire, it declined as the Romans lost control over the Red Sea in the third century CE. Nonetheless, commercial links never completely died out, and contact between the West and the East slowly increased with the revival of Europe's population and economy in the eleventh century. In the thirteenth century, the formation of the Mongol empire provided safe opportunities for European merchants, missionaries, and diplomats to travel to Persia, China, and South Asia. Italian merchants, already prosperous in the Mediterranean, set off for Eastern lands along the land and sea routes. Western missionaries and diplomats set out to convert the Mongol khan and gain an ally in defeating the Muslims in the Levant. Often these travelers

would reach India. Christian pilgrims sought the tomb of St. Thomas, which they believed was located at Mylapore on the east coast of India. They were also seeking a legendary and powerful Christian king, Prester John, rumored to exist somewhere in the East, possibly India (and after 1330 in Ethiopia), who might someday help European Christians reclaim Jerusalem.

The most famous traveler to the East and to South Asia during the medieval era was the Venetian merchant Marco Polo, who departed for China via an overland route in 1271. After serving Khubilai Khan for almost 17 years, Polo left China in 1292 via the Indian Ocean sea route and visited Sumatra, Ceylon (modern Sri Lanka), and the southern coast of India. In his account of that voyage, Polo reported on the customs and products of India, his pilgrimage to the tomb of St. Thomas, and the alleged miracles surrounding St. Thomas's shrine. Polo also referred to tales of Prester John throughout his narrative. Like most merchants at this time, Polo returned with more than goods; he also delivered diplomatic messages from the Great Khan to the pope.

The founding of two missionary orders in the thirteenth century, the Franciscans and the Dominicans, also led to increased contact between Europe and South Asia. The first medieval European to provide an account of India was the Franciscan John of Monte Corvino. On a papal mission to China to make contact with the khan, John, along with his companion the Dominican friar Nicholas of Pistoia, traveled by sea from Persia to India in 1291. John spent 13 months in the vicinity of St. Thomas's shrine, where he claimed to convert 100 Indians. Next, the Franciscan friar Odoric of Pordenone arrived on the Malabar Coast in 1321. Also en route to China, Odoric spent a year in India and generated a thorough account of the region, including its cultivation of ginger and pepper. In 1321–1322 the Dominican Jordan of Séverac reported in his *Book of Marvels* on India's harsh climate, its strange flora and fauna, and the customs and practices of the Hindus, including the practice of *sati*, namely the immolation of widows on their husbands' funeral pyres. He also remarked on the martyrdom of four friars at Thana, near Bombay, who were burned to death by local Muslims for committing blasphemy against Muhammad.

➤ AFANASII NIKITIN

The first known Russian to travel to India was Afanasii Nikitin, who departed from Tver, Russia, in 1468 to trade furs in the north Caspian region. Near Astrakhan, however, Nikitin fell prey to a Tatar attack and lost all his goods. He crossed the Caspian Sea and ventured through Persia and then India in hope of recouping his losses. After three years in India, Nikitin began his return to Tver across the Arabian Sea and finally the Black Sea. Before reaching home, Nikitin died in 1475 near Smolensk. Although nothing is known about Nikitin's life before his journey, he is remarkable because he kept an account of his expedition in a text subsequently titled *Voyage beyond Three Seas*. Nikitin reported in astute detail Hindu customs and the geography of India. This account occupies a unique place in Russian historical and literary studies because it was unusual for a Russian merchant to travel such distances and even more extraordinary for a merchant to document his journey. Furthermore, Nikitin recorded his personal thoughts and feelings, offering scholars a glimpse into the mind and heart of a business-minded medieval Russian.

—Mary Jane Maxwell

To the Europeans, the accounts of these travelers were all strange and marvelous. All three friars searched fruitlessly for Prester John while in India.

In the mid-fourteenth century, contact between Europe and the Farther East temporarily waned due to the Black Death, collapse of Mongol rule, devastations caused by Timur-i Leng's campaigns, and economic decline. Nonetheless, Italian merchants maintained their commercial ties with the Muslim-controlled ports in the eastern Mediterranean. From Genoa and Venice they funneled goods from the Far East and South Asia throughout western Europe. In 1419 the Venetian merchant Nicoló de Conti set off on a Muslim caravan to India in an attempt to bypass the Arab middlemen of the eastern Mediterranean ports. For the next 25 years he traveled and traded primarily in South Asia along the Arab-controlled land and sea routes that connected Europeans to the East. Upon his return to Venice

in 1444, Conti petitioned the pope to forgive his conversion to Islam while abroad. As light penance for his absolution, Pope Eugenius IV required Conti to provide an account of his travels to the papal secretary and renowned humanist scholar Poggio Bracciolini. Conti's detailed observations of South Asia's products, customs, and geography were published by Poggio in his *Historia de varietate fortunae* (*A Story of the Vicissitudes of Fortune*). Conti's account, as told by Poggio, influenced fifteenth-century geographers and cartographers including the maker of the Genoese World Map of 1457, who also took into account Marco Polo's observations. This map placed the continents of Africa, Asia, and Europe in roughly their proper proportion and depicted Africa as navigable by sea. Such information gave hope to European explorers who attempted to reach India via a sea route at the end of the fifteenth century.

Europe's Overseas Explorations and the Crusading Tradition

The Reconquista, or Reconquest, which various Iberian Christian states waged against the Moors of Al-Andalus from roughly the middle of the eleventh century to 1492, left an undoubted imprint on Iberian Christian culture, and it was one of several factors that drove the overseas explorations of Portugal, Castile-León, and Aragon.

Prince Henry of Portugal (1394–1460), who had already crusaded in North Africa at Ceuta in 1415 (and would crusade again in 1437 and 1458), assumed administration of the Order of Christ in 1420 in order to further this Portuguese crusader-military order's operations against Islam in North Africa and beyond. To this end, Prince Henry used the resources of the order to finance the small expeditions of exploration that he sent out almost annually into the Atlantic and down the west coast of Africa beginning in 1419. As his contemporary biographer Gomes Eannes de Azurara noted in the *Chronicle of Guinea*, a sycophantic history of Henry's promotion of these voyages, the prince wanted to discover how far the dominion of the Muslims extended because "every wise man is obliged . . . to wish to know the power of his enemy." Beyond that, he sought to discover some yet-unknown Christian king or prince with whom he could ally in his continuing struggle against these "enemies of the faith."

Azurara exaggerated Henry's role in these ventures and failed to acknowledge the equally significant role that Henry's brother Pedro played in promoting the expeditions. Nevertheless, the fact that resources that had been donated to the Order of Christ for waging holy war against Islam were used to subvent the voyages and that Azurara took pains to point out the prince's crusading motives speaks volumes about popular perceptions, values, and motives in regard to such overseas adventures. Indeed, a series of papal bulls was issued praising Portugal's exploration endeavors and expressing the hope that such efforts would result in Latin Christendom's linking up with Prester John, the faraway Christian priest-king whom crusading Europe had been searching for since the twelfth century. Additionally, to spur Portugal to further efforts, the papacy granted the small monarchy exclusive

COLUMBUS EVALUATES THE MEANING OF HIS FIRST VOYAGE TO THE INDIES

On his homeward voyage in early 1493, Columbus composed an account of his successful expedition to the "Indies" for Luis de Santángel, a counselor to King Fernando and one of Columbus's most avid supporters. Upon landing in Lisbon in March, Columbus dispatched the letter to the Spanish court in full expectation that news of his accomplishment would be warmly received. He was not disappointed. Known subsequently as *A Letter Concerning Recently Discovered Islands*, this report was soon circulated widely throughout Europe. The following excerpt is from the letter's closing lines.

"[S]ince Our Redeemer has given this victory to our most illustrious king and queen, and to their renowned kingdoms, in so great a matter, for this all Christendom ought to feel delight and make great feasts and give solemn thanks to the Holy Trinity with many solemn prayers for the great exaltation which they shall have, in the turning of so many people to our holy faith, and afterwards for temporal benefits; for not only Spain but all Christians will have hence refreshment and gain."

commercial rights in Africa and the "Indies." Needless to say, the papacy recognized fully that secular motives as well as crusading fervor drove the Portuguese. But God's agents deserved their just reward.

The momentum initiated by Henry and Pedro picked up considerably during the later years of the reign of Afonso V (r. 1438–1481) and especially during the reign of his son João II (r. 1481–1495), both of whom also crusaded in North Africa. João, who famously rejected as impractical the overtures of Christopher Columbus to sail west to reach the Indies, lived long enough to see the realization of his long-expressed hope that his captains would circumnavigate the tip of Africa. In 1488 Bartolomeu Dias, whom King

João had specifically instructed to seek out Prester John, rounded the Cape of Good Hope. Dias did not find Prester John, although early Portuguese visits to Christian Ethiopia, beginning in the last decade of the fifteenth century, would, at least momentarily, appear to have achieved that goal. What Dias did do was to open the way for the voyage of Vasco da Gama to Calicut, India, and his triumphant return home.

When da Gama reached Calicut in May 1498 he visited a temple dedicated to a Hindu goddess, which he mistook for a church raised in honor of the Virgin Mary. Laboring under that misperception, he informed the town's raja that for 60 years the monarchs of Portugal had been searching for Christian kings such as he, and this was the primary motive behind his voyage. That was a bit of dissembling, but regardless of the unquestioned mercantile motives that primarily drove this voyage, evidence strongly suggests that da Gama and King Manuel I (r. 1495–1521), who had dispatched da Gama to the Indies, shared Prince Henry's desire to find Prester John and to open a new crusade front. The Portuguese soon learned that the vast majority of India's coastal population was not Christian, and they subsequently sent missionary friars to the "Indies." Such missionary activity along the coasts of India, Africa, and other regions of the expanding Portuguese empire in the East was accompanied by an equally sincere desire to wage holy war at Islam's back door, a desire on which the Portuguese acted with militant gusto during the early sixteenth century. In 1541, for example, a contingent of Portuguese soldiers led by Christovão da Gama, son of Vasco da Gama, arrived in Ethiopia to assist Emperor Gelawdewos, whose lands were being overrun by the neighboring Adel sultanate led by Ahmad ibn Ibrihim al-Ghazi (also known as "the left-handed"). The Portuguese were a key factor in the victory at Wayna Daga (February 13, 1543) that resulted in Ahmad's death and led directly to Ethiopia's driving Adelite forces out of the empire. To be sure, worldly purposes mainly drove Portugal's adventures and empire building in the Indian Ocean, but as this campaign suggests, it would be wrong to disregard Portugal's continuing desire and efforts to wage crusades.

Another example of this mind-set is the military career of Afonso Albuquerque (1453–1515), viceroy of India and a *commendador* of the Spanish military order of Santiago, which had served as one of the primary driving forces of the Reconquista since its founding in 1170. Albuquerque had fought Muslims in Morocco, the Atlantic, and Italy prior to going to the Indian Ocean in 1503. In 1507 he won a singular victory over an Arab fleet off of Hormuz. According to the *Commentaries of Afonso Albuquerque the Great*, a posthumous compilation of selections from his papers strung together by his son, when Albuquerque's sailors fished the bodies of Muslim sailors from the waters, they found about 80 who had been killed by arrows, although no one in the Portuguese fleet had possessed a bow or knew how to use one. The *Commentaries* notes that God performed this miracle to demonstrate how victory is guaranteed for those who fight with true faith against unbelievers. That putative miracle and sentiment could just as easily have been recorded and expressed by any chronicler of the First Crusade, but a sixteenth-century epic poet, Luís Vaz de Camões (ca. 1524–1580), was as impressed by this reported incident as any twelfth-century historian would have been. He noted in his great national epic poem the *Lusiads* (1571), which celebrated the voyage of da Gama and placed the events of 1497–1499 into the context of the crusades, that this miracle showed "How God will fight for them who fight for Him." Camões himself had been a crusader and had lost an eye fighting Moors in North Africa.

By 1488 Columbus realized that the Portuguese Crown would not support his grand plan to reach the Indies by sailing west. He had, however, other potential patrons in the persons of the Catholic monarchs of Spain, Fernando II of Aragon (r. 1479–1516) and Isabel of Castile and León (r. 1474–1504). Both were avid crusaders in Iberia, and with their subjugation of Granada on January 2, 1492, the way was open for their minimal but real support of Columbus's venture. Many motives drove Columbus, but one purpose that inspired this complex and often inconsistent man was the dream of converting the Great Khan of Cathay and joining with him in a final,

great, and successful crusade against Islam, which in turn would usher in even greater events. In his so-called *Book of Prophecies*, a compilation of texts prepared essentially between 1501 and 1505 for Fernando and Isabel, the master mariner placed the discovery of the Indies into the grand divine plan for the forthcoming salvation of all humanity, the Final Judgment, and the End of Time. He argued that his voyage to the west had been the first step in the process of liberating Jerusalem, itself a necessary step in the unfolding of God's plan of universal salvation. Leaving aside the issue of whether or not he actually believed these messianic prophecies (and it seems he did), it is clear that Columbus was appealing to a widespread belief that the road to Jerusalem lay through the Indies. After all, he was appealing to two crusaders who saw their victory over Granada as more than just the culmination of over four and a half centuries of crusading in Iberia. It was another stepping stone in their God-sanctioned global struggle against Islam, a struggle that was foreordained to result in triumph.

The Early Voyages of Columbus

On October 12, 1492, after 33 days in the Atlantic searching for a western route to Asia, Christopher Columbus and 90 men landed in the Bahamas. On his second trip in 1493 Columbus sailed with 17 ships and more than 1,500 settlers. The objectives had shifted from discovery and trade to conquest and colonization, and a

new era in world history had begun, one that would see the rise of Europe as a global power and the destruction of the indigenous peoples of the Americas.

Born in the Italian port city of Genoa, Christopher Columbus (1451–1506) began life in his father's weaving business but took to the sea at an early age and gained considerable experience of the western Mediterranean and the Atlantic. In his mid-20s he moved to Lisbon, where he earned a living in various maritime activities and where he first conceived of the idea of sailing west to Japan and Cathay.

Through his wife's family's connections, Columbus approached King João II of Portugal with his proposal but was turned down. In 1485 he went to Spain to try his luck with King Fernando and Queen Isabel, rulers of Aragon and Castile-León. They listened to Columbus's ideas as he showed them maps and explained his theories, and they set up a commission to review the project. But the Spaniards rejected it too, at least in part on the grounds that Columbus had overestimated the size of Asia and underestimated the size of the Earth. They concluded that the eastern shores of Japan and Cathay were not nearly as close to Europe as he claimed they were, and they were correct.

But Columbus persevered. Back in Portugal in 1488, he once more tried to persuade João II of the viability of his project when, to Columbus's great misfortune, Bartolomeu Dias appeared in Lisbon after a two-year voyage with the news that he had rounded the cape of Africa and that the way to India lay open. Any hopes that Columbus might have had were dashed. But this time—perhaps because of the Portuguese success—the Spaniards decided to support him. After all, it was a relatively small outlay of capital with a potentially huge payoff if Columbus was correct.

On their first voyage, Columbus and his Spanish cocaptains sailed three small ships westward from the Canary islands by dead reckoning, which means that in the absence of charts they used their accumulated experience with stars, winds, compass, and hourglass to estimate distance and to set a course at the same latitude. After a month the crew began to grumble, and there

was the threat of mutiny: Columbus had promised a crossing of between 700 and 750 leagues (2,100 and 2,250 miles or 3,380 and 3,600 kilometers) and they had already sailed 800 leagues (2,400 miles or 3,800 kilometers).

Within days, however, land was sighted, and Europeans made their first contact with the Tainos, an Arawak people, on an island they called Guanahani (probably San Salvador). It was not what the explorers expected: instead of the wealth and cities of the Far East, they found poor, primitive tribal people and barely a trace of gold. To make matters worse, within weeks one of the Spanish cocaptains absconded with the *Pinta*. A month later Columbus's flagship the *Santa Maria* foundered on a reef, and he found himself stranded on Hispaniola (Haiti/Dominican Republic) with but the smallest ship *Niña* and too many crew members. Eventually the *Pinta* and *Niña*, the two remaining ships, were reunited, but Columbus was forced to leave a colony of 39 men when he returned to Spain in

early March 1493. It was the last he or any other European ever saw of them.

The second voyage, which lasted for three years (1493–1496), was a much larger expedition. In addition to soldiers, farmers, and craftsmen, Columbus brought with him cows, horses, chickens, pigs, and seeds for wheat, vegetables, and fruit; in return, staples such as sweet potato and maize (corn) and other crops such as tobacco and cacao were introduced to Europe, thereby altering farming, nutrition, and food production on a worldwide scale.

They also brought germs. With no natural immunities to protect them, native peoples were devastated by epidemic Afro-Eurasian diseases such as smallpox. It is estimated that over the course of the following centuries up to 95 percent of the indigenous peoples of the Americas succumbed to smallpox and other deadly diseases, something on the order of between 60 million and 80 million people. Columbus continued to insist that he had found Asia, but by the

➤ WHY TRAVEL TO THE INDIES?

The following account is from the *Logbook (Roteiro) of the First Voyage of Vasco da Gama*. The journal was kept by an anonymous crewmember aboard Vasco da Gama's ship the *São Rafael*. This account of the long and costly journey of spices from Calicut to the Mediterranean indicates one of the several reasons why the Portuguese desired direct access to the Indies. Crusade ideology was not the only, or even the main, factor driving Portuguese exploration.

"From this country of Calicut . . . come the spices that are consumed in the East and the West, in Portugal, as in all other countries of the world, as also [are] precious stones of every description. The following spices are to be found in this city of Calicut, being its own produce: much ginger and pepper and cinnamon. . . . Cloves are brought to this city from an island called Melqua [Malacca]. The Mecca vessels carry these spices from there to a city in Mecca [in Arabia] called Judea [Jeddah], and from the said island to Judea is a voyage of 50 days sailing before the wind. . . . At Judea they discharge their cargoes, paying customs duties to the [Mamluk] Grand Sultan. The merchandise is then transhipped to smaller vessels,

which carry it through the Red Sea to a place close to Santa Catarina [Monastery] of Mount Sinai, called Tuuz [El Tur] where customs dues are paid once more. From that place the merchants carry the spices on the backs of camels . . . to Quayro [Cairo], a journey occupying ten days. At Quayro duties are paid again. On this road to Quayro they are frequently robbed by thieves. . . .

At Quayro the spices are embarked on the river Nile . . . and descending that river for two days they reach a place called Roxette [Rosetta], where duties have to be paid once more. There they are placed on camels, and are conveyed in one day to a city called Alexandria, which is a sea-port. This city is visited by the galleys of Venice and Genoa, in search of these spices, which yield the Grand Sultan [an annual] revenue of 600,000 cruzados."

The Inca Highway

One of the most important elements in the success of the Inca empire was its remarkable system of highways extending for at least 24,500 miles (40,000 kilometers). For the empire to operate, it was essential to be able to move goods and people rapidly from place to place. An all-weather road was particularly important for the rapid movement of the army when campaigning to expand the empire or when moving to suppress rebellions. This system also served as a communications network linking all of the many provinces of the empire to a central command system.

The imperial highway system, called the Capac Ñan in the Inca language Quechua, was comprised of two main trunk roads that ran roughly north-south. One was the coastal route from Tumbes on the Peruvian north coast extending south to Talca in modern Chile. The other

THE INCA POSTAL SYSTEM

The Inca postal system was intimately tied to the highway system. Relay runners called *chasqui* were stationed all along the road at intervals of about .9 miles (1.4 kilometers). The swiftest-running young men from the nearest communities performed this duty as laborers, serving a term of one month. They were stationed in pairs at small stone houses along the highway and took turns keeping watch for approaching messengers. A message could be relayed verbally or carried on a *quipu*, or knotted string, passed from one runner to the next. Small amounts of goods could sometimes be carried, and it is said that the emperor could dine on fresh fish from the Pacific Ocean brought to him in fewer than two days. The speed of this system has been estimated at about almost 150 miles (240 kilometers) a day.

—Gordon McEwan

Ancient stone steps lead upward on the Inca Trail in Peru. The Inca Trail was built more than 500 years ago and connected Machu Picchu to the southern Inca capital, Cuzco, and the northern capital, Quito (in present-day Ecuador). (Ben Ferguson)

was the highland route, which extended from Quito in modern Ecuador to Mendoza in modern Argentina. These two trunk roads were cross-connected by a network of shorter highways that linked all of the Inca provincial centers into one large system. Use of this highway system was

restricted to those on official imperial business. Commoners were not allowed to travel on it without special permission.

The construction of the roads varied from place to place depending on the circumstances of the terrain. The width of the highway varied from 3 to 13 feet (1 to 4 meters). The surface treatment ranged from fine paving stones on one extreme to natural dirt surfaces on the other, depending on the climate and terrain to be crossed. Because there were no wheeled vehicles that needed to use them, Inca roads often rose precipitously, climbing steeper slopes with long flights of steps or making use of extensive switchbacks to gain altitude over relatively short distances. Where the ground was marshland or bog, the Inca engineers built raised causeways. Drainage was achieved through gutters and culverts, and often low walls delimited the margins of the road, keeping it free of windborne sand and other obstacles. Tunnels and retaining walls were frequent features of a road as it crossed steep and mountainous terrain.

Bridges were a vital part of the highway system, and without them the highways would have been useless. In the steep canyons and rugged terrain of the Andes, rivers tend to be swift and very difficult to cross. Thus, bridges of various types were constructed and carefully maintained. The most famous are the suspension bridges constructed of rope made from ichu grass. Bridges of this type were up to 65 feet (20 meters) long. These bridges required specialists for their construction and maintenance and had to be renewed on an annual basis. Usually a small community that had the specific task of keeping the bridge was located near the crossing. Bridges crossing shorter distances and more placid waters could be made of pontoon rafts, wood beams, or even stone slabs. One other method commonly used to cross rivers was a device called an *oroya*, which consisted of a basket suspended under a cable that spanned the river. A passenger sat in the basket and was pulled along the cable crossing the water.

As with the bridges, construction and maintenance of the roads were the responsibility of the communities nearest where they passed. Each community was responsible for its segment of the highway as part of its labor tax, and in

this way the work was distributed over a large segment of the population with no one being overly burdened.

An important feature of the royal road system was the presence of way stations known as *tampu*, located approximately every 13.5 miles (22 kilometers). According to Pedro de Cieza de León (1520–1554), the rate of travel for official parties of high rank and not on urgent business was about 12.5 miles (20 kilometers) a day, meaning that the *tampu* were placed at intervals of about a day's travel. *Tampu* varied depending on their location, but all provided lodging, food, and supplies for those traveling on official business. Later, this network of roads served to facilitate the movement of Spanish forces in their drive to conquer the Inca.

Politics and Statecraft—Internal and External State Expansion

Toward the middle of the eleventh century, Abu al-Hasan Ali ibn Muhammad ibn Habib al-Mawardi (972–1058), an Islamic jurist in Baghdad, composed a treatise on government titled *Ordinances of Government*, in which he delineated the qualities and duties of an ideal caliph. According to al-Mawardi, the caliph's many obligations included executing justice, defending Islam from intrusions, ensuring peace by maintaining the safety of internal routes and the integrity of frontier fortifications, using the treasury wisely, and employing capable and trustworthy ministers.

Ironically, this was a period in which the Abbasid caliphs of Baghdad had lost all effective control over governmental matters, initially to Buyid emirs and then to Seljuk sultans. Nevertheless, the caliphal responsibilities that al-Mawardi enumerated nicely summarize the political realities of the period 1000–1500 so far as Afro-Eurasia was concerned. Regardless of who governed their affairs, most states were becoming increasingly complex so far as their organs of government were concerned, and much of this was in response to increasing demands from all levels of society for justice, security, and good government. Consequently, many of them (certainly not all, as Song China bore witness) tended to grow in size, with some of them becoming virtual empires across large portions of Afro-Eurasia. Moreover, as they expanded there was a continued trend toward interaction among them. In brief, Afro-Eurasia was becoming a world community. In the course of the thirteenth century, this was most dramatically manifested in the Mongol empire, the largest land empire in history. In western sub-Saharan Africa, great trading empires such as Ghana, Mali, and Songhai were emerging, all of which had profound contact with the greater Islamic world in North Africa and Southwest Asia. And Zimbabwe in East Africa was tied into the world of the Greater Indian Ocean by reason of its contacts with coastal trading emporia.

Across the oceans a similar phenomenon was at work in the Americas, which were untouched by the developments taking place in Afro-Eurasia. Before the fifteenth century had ended, two of the Americas' greatest empires had emerged and were prospering, the Aztec empire of central Mexico and the Inca empire of the South American Andes. These might be the two best-known pre-Conquest empires of the Western Hemisphere, but they were only two of the many complex polities that flourished and interacted throughout the Americas. Certainly the Mississippian culture centered on Cahokia near present-day East St. Louis, Illinois, had far-reaching contacts.

In like fashion, many other Afro-Eurasian states tend to be unjustly overshadowed in the pages of history because of the mesmerizing attraction to modern students of the Mongol empire. Chief among these is the so-called forgotten empire of Byzantium that reached heights of cultural, political, and military influence in the early eleventh century; underwent a series of crises later in that century; witnessed its capital city seized in 1204 and held by crusaders until 1261; and was fragmented by attacks from both Western coreligionists and Islamic Turks but held on grimly through all of these trials until 1453. In the course of these four and a half centuries, Byzantium not only survived against all odds but also played profoundly important diplomatic and cultural roles in the Balkans, eastern and central Europe (most notably the land of the Rus), and Italy.

In the course of these four and a half centuries, Byzantium not only survived against all odds but also played profoundly important diplomatic and cultural roles in the Balkans, eastern and central Europe (most notably the land of the Rus), and Italy.

Other Christian states played equally significant roles including Ethiopia, which was the sole Christian state in Africa during these centuries. Even more significant perhaps, the emerging nations, principalities, and city-states of western and central Europe were not only expanding the frontiers of Latin Christendom into the Baltic and deep into the Iberian Peninsula during the period from roughly 1100 to 1300

but were also supporting the crusader states of the eastern Mediterranean. During the fourteenth and fifteenth centuries, the fairly new kingdoms of the Iberian Peninsula, notably Portugal, Castile, and Aragon, supported overseas explorations that, by the end of the fifteenth century, opened up the African coasts, the Indian Ocean, East Asia, and, most important of all, the Americas to direct contact by western Europeans.

Within Dar al-Islam (the House of Islam), which by 1500 stretched from West Africa to the southern Philippines, a wide variety of political communities followed this same general pattern of growth, increasing complexity, and outreach far beyond their borders. The Fatimid empire of the eleventh century and much of the twelfth century certainly played a significant role as a conduit of trade and cross-cultural contacts, and this was but one of many Islamic states that evolved highly effective bureaucratic infrastructures and had far-reaching influences across major portions of Afro-Eurasia. One of the most dramatic was the late-fourteenth-century empire of Timur-i Leng (Tamerlane), a short-lived attempt at creating a world empire along the lines of the Mongol empire. Although this effort died with its would-be world conqueror in 1405, Amir Timur (or Temūr) laid the basis for both the culturally brilliant Timurid dynasty of western Central Asia and even the long-lived Mughal dynasty that established itself in India in the sixteenth century. Timur's legacy was mixed. His armies ravaged large swaths of Central Asia, the Caucasus, Southwest Asia, and eastern Europe, destroying many great cities in the process and killing untold numbers of people. Yet he also established his capital of Samarqand (in present-day Uzbekistan) as a focal point of the Silk Road during what might well be called the Indian Summer of this great trans-Eurasian network of caravan routes.

Of all the Islamic state builders and rulers who arose in Southwest Asia—the Seljuks, Ayyubids, and the Mamluks, to name but three of the most important—the Ottoman Turks who emerged in fourteenth-century Anatolia were certainly the most significant. By 1500 they had established an empire that not only had captured Constantinople but also extended deeply into southeastern Europe and was on the verge of dominating the Arabian Peninsula and much of North Africa. The Ottoman empire, a vast multiethnic entity, would play a major transregional role in world history down into the early twentieth century.

Whereas the Islamic sultanate of Delhi dominated northern India, where Muslims and Hindus were forced by circumstances to reach some sort of accommodation, the southern portions of the subcontinent saw the rise of strong native states, most notably the Chola kingdom and Vijayanagara. Of these, the former had a political and cultural reach far into the Indian Ocean. The smaller states of India that proliferated along its two coasts enjoyed the prosperity that came with fostering, controlling, and taxing the commerce that attracted maritime merchants who arrived from all points between East Africa and South China and, finally, at the very end of the fifteenth century from Western Europe.

China during these five centuries witnessed much of its northern and western territories overrun by such “barbarian” peoples as the Tanguts, who established the XiXia empire; the Khitan (Qidan) Mongols,

who established the Liao kingdom; and the Jurchen (Ruzhen), who created the Jin empire. Despite this loss of territory, China's Song dynasty, in both its Northern (960–1126) and Southern incarnations (1127–1279), managed to maintain and improve on what was probably the most effective governmental bureaucracy in the world at that time. What is more, the attraction of Chinese civilization resulted in a significant level of sinification of the XiXia, Khitan, and Jurchen peoples and their states. Eventually all of China was conquered by the Mongols, who established the Yuan dynasty (1279–1368), which now claimed the Mandate of Heaven. The mandate lasted only a century, but during that time travelers from as far as Western Europe came to the Middle Kingdom. The native Ming dynasty (1368–1644) that threw out the Mongols initially sought to extend Chinese political and commercial influence far into the waters of the Indian Ocean with the seven voyages of Zheng He's fleets (1405–1433). After abandoning this enterprise, the Ming empire concentrated its energies on its northern frontier in order to ensure that never again would the Mongols overrun China. With this focus on its steppe frontier, the Ming set in place a policy that several centuries after their being replaced by the Qing dynasty (1644–1911) would result in major Chinese expansion into Mongolia and eastern Central Asia, today's Xinjiang.

Mainland Southeast Asia, so deeply influenced by both China and India (and, hence, its being known into modern times as Indo-China), saw the rise of several hybrid states that were essentially native in their cultures but exhibited strong outside influences, sure evidence of their contacts with a world greater than their immediate borders. Chief among these were the Khmer empire, which for centuries dominated a vast region encompassed by present-day Cambodia and major portions of Laos, Thailand, and southern Vietnam, and the Dai Viet kingdom of northern Vietnam.

Korea was essentially unified under the Koryo, or Goryeo, dynasty (918–1392), and during its first century plus of rule the family set Korea firmly on the path to establishing a central government modeled on that of China but with distinctly Korean overtones. By 1200, however, power passed from the royal court to military aristocrats, thereby causing a sharp departure from the Chinese model. This largely paralleled what was happening at the same time in Japan, where native aristocratic elements overwhelmed many of the bureaucratic institutions and forms of government that the Japanese had copied from Tang China (618–907) in the seventh and eighth centuries.

Unlike Japan, which twice successfully resisted Mongol invasions, Korea submitted to Mongol rule and became a vassal state of the empire. This was probably a blessing for the weak royal family, which was propped up by its Mongol overlords into the fourteenth century. In 1392, however, the Koryo dynasty gave way to the Yi (also known as Choson) dynasty, which reigned until 1910. Under the Yi, Confucianism flourished in large part due to close diplomatic ties with the Ming court at Beijing. Indeed, Confucian values and systems so dominated Korean culture and the structures of Yi government that Korea under the Yi has been termed “the perfected Confucian state.”

Across the waters of the Sea of Japan, to the contrary, Japan, enjoying relative isolation or, rather, separation on its terms, developed into a feudal society with governmental structures that sharply deviated from those crafted in imitation of Tang China centuries earlier. In 1185 the Minamoto family established the shogunate, a military form of government in which all power was in the hands of the shogun, or commander in chief, while a puppet emperor reigned in Kyoto. This feudal system, known as the *bakufu* (tent government), dominated the island empire's government and shaped the lives of all Japanese until modern times.

Japan might not have been interacting with its neighbors to the degree of other strong governments, and it certainly was not expanding its territory, but very much like the vast majority of other states around the world, Japan witnessed during these five centuries a growth in effective government, despite its feudal underpinnings.

—Alfred J. Andrea

Under the Yi, Confucianism flourished in large part due to close diplomatic ties with the Ming court at Beijing. Indeed, Confucian values and systems so dominated Korean culture and the structures of Yi government that Korea under the Yi has been termed “the perfected Confucian state.”

■ Introduction: Sub-Saharan Africa

Rarely does a society or state develop in isolation. It is normal for polities to not only grow organically out of the cultures of the people who craft them but also to be influenced by external stimuli and to borrow from or model themselves on foreign entities. Such was the case in sub-Saharan Africa. It would be wrong to consider such states as Ghana, Mali, Gao, Great Zimbabwe, and the Swahili cities as creations imposed on Africans from outside. Yet each rose in response to certain opportunities presented by both distant and closer-to-home forces, namely trade. Additionally, with the major exception of Great Zimbabwe, they all embraced Islam in the course of their developments as states. Islam did not create them, but their embracing of Islam, in whatever form and to whatever degree, was a factor in their growth.

Very much like the emerging kingdoms of Europe in the period from roughly 500 to 1000, in which conversion to Byzantine and Latin forms of Christianity provided monarchs and their nascent states with a certain legitimacy and sup-

port, and, just as important, integration into a large network of societies and states that espoused the same religion, so also Islam provided this opportunity for these sub-Saharan kings and their states.

Writing in 1067–1068, the Andalusian geographer al-Bakri noted the different levels of Islam's penetration into sub-Saharan West Africa.

The monarch of Takrur on the lower Senegal River had enthusiastically embraced Islam, imposed Sharia (Islamic holy law) on his subjects, and waged holy jihad against his non-Muslim neighbors. Takrur appears to have been the first state in the West African savanna to have embraced Islam, and initially Islam benefitted the kingdom economically and politically, especially insofar as it allied with the powerful Almoravids, a militantly fundamentalist Muslim state to their north. But ultimately Takrur disintegrated, finally being swallowed up by a new Islamic state, Mali, in the late thirteenth century. Quite possibly Takrur's Islamization proved ultimately to be a classic double-edged sword, a factor that

worked for and against its best interests. Its Almoravid allies passed out of existence by the mid-twelfth century, and Takrur had made too many enemies close to home.

Wagadugu, better known today as the kingdom or empire of Ghana (although “Ghana” was actually the title accorded its monarchs), was a political and economic competitor of Takrur. Its monarch (or ghana), Tunka Manin, maintained allegiance to traditional religious ways but was generous in inviting Muslims to live in his kingdom. Indeed, his capital, Koumbi-Saleh, was a double city consisting of two separated walled towns connected by a strip of private dwellings. One of those two walled entities was inhabited by Muslims and contained 12 mosques. In addition, Tunka Manin employed Muslim interpreters, and all the officials in charge of the treasury were Muslims, as were a majority of his other ministers. Obviously he realized the economic and political advantages presented by Islam, even as he followed the ancient ways of his Soninke people. But this adherence to what Muslims disparagingly called “idol-worship” did not last much longer. According to another Andalusian geographer, al-Zuhri, who was writing in the 1130s, the people of Wagadugu converted to Islam in 1076. How sweeping and complete that conversion was initially is impossible to say, but the kingdom and its people were firmly Muslim a century later when the kingdom was absorbed by Mali, a state in which Islam had taken firm root.

Islam therefore, obviously an import from outside, must be seen as a significant tool in state building and expansion for many but not all of the polities of sub-Saharan Africa. That noted, however, as was true for both Takrur and Ghana/Wagadugu, as well as for all the other sub-Saharan African polities of the eleventh century that were beginning to welcome in Muslims and even to adopt Islam, Islam did not create these kingdoms and city-states. Their foundations were indigenous.

—*Alfred J. Andrea*

Ethiopia

In the half millennium between 1000 and 1500, the Ethiopian kingdom took a shape that later generations deemed definitive. Two major politi-

cal developments were the emergence and overthrow of the Zagwe dynasty (ca. 1150–1270) and its replacement by the Solomonic, or Solomonid, dynasty, which ruled until 1974. During this period Ethiopia shared in the expansion of Red Sea trade, which grew steadily following the tenth-century establishment in Egypt of the Fatimid dynasty. With expanding trade, the political power of Islam spread in northeastern Africa. The Zagwe stimulated a cultural revival, which carried through the Solomonic period. Within the Ethiopian Orthodox Church monastic renewal took place. Finally, as Ethiopian rulers expanded their territory, the peoples whom they ruled became increasingly diverse.

The events of the first centuries of the millennium are obscure. The rise toward the middle of the twelfth century of the Agaw-speaking Zagwe, based in the mountains around the headwaters of the Takazze River, brings developments into sharper focus. This region had already been important in the sixth century, and the Zagwe emergence reflected the steady southward shift of power after the eclipse of Aksum in the seventh century. The dynasty's most enduring achievement was construction of a remarkable complex of rock-hewn churches. Tradition ascribes them all to the dynasty's most famous ruler, Lalibela, after whom they have come to be known. Lalibela ruled roughly from 1205 to 1235 and was subsequently regarded as a saint. The complex symbolically reproduces the geography of the Holy Land, which was becoming a destination for an increasing number of Ethiopian pilgrims. However, a further shift of power led in 1270 to the violent overthrow of the last of Lalibela's successors by Yikunno Amlak, the founder of a new dynasty, who claimed descent from the biblical King Solomon and the Queen of Sheba and also claimed to be the heir of the political legacy of Aksum.

The Solomonic rise is surrounded by legends. Tradition holds that the dynasty came to power peacefully through the intervention of Saint Takla Haymanot, an outstanding representative of monastic renewal. Allegedly, he persuaded the last Zagwe king to acknowledge the rightful claim of the Solomonic. In return, tradition holds that Yikunno Amlak gave the Church one-third of the land in the kingdom. The legend of a dynasty

Bet Giyorgis (St. George's), one of a number of rock-hewn churches reportedly built under Lalibela, a Christian king of Ethiopia during the twelfth or thirteenth century. (Klaas Lingbeek van Kranen)

of Christian kings, descended from Solomon, emerged in the Middle East and was elaborated in a text, the *Kebra Nagast* (*Glory of the Kings*). By the ninth century, the legend had attached itself to Ethiopia. The Zagwe, who were Kushitic rather than Semitic speakers, prevented the translation of the text from Arabic into Ge'ez, the Ethiopian literary language. Yikunno Amlak successfully appropriated the legend and used it as propaganda. The substance of his claim was that his people were Semitic-speaking Christians—the Amhara—and products of the southward spread of language, culture, and material technology from the classical empire of Aksum.

The Solomonic dynasty was not firmly established until the rise, after decades of succession conflicts, of Amda Seyon (r. 1314–1344), one of the dynasty's great rulers. Amda Seyon expanded his empire in all directions, challenging the control of international trade by a string of Muslim principalities to his east and establishing his rule

around Lake Tana, the source of the Blue Nile. His name, which means “Pillar of Zion,” reflects the identification of the Solomonic rulers with the kings of biblical Israel. To them, Christian Ethiopia was the new Zion. This did not preclude conflict with the Church, with which Amda Seyon's relations were turbulent. His polygynous practices were attacked by the generation of monastic leaders who succeeded Takla Haymanot. In spite of these conflicts the Church expanded rapidly, with only the Muslim communities proving resistant over the long run.

Amda Seyon's grandson, Dawit (r. 1382–1411), reconciled the monks with rich land grants and paved the way for his son, Zara Yaqob (“Seed of Jacob,” r. 1434–1468), under whom military expansion continued. However, Zara Yaqob is most noted for his impact on Ethiopian Christianity. He was an author and theologian and led the Ethiopian Church to recognize as normative long-standing practices, distinct from those of its mother Alexandrian Church, such as the recognition of Saturday (the Sabbath) as a holy day equal in status to Sunday and a greatly expanded devotion to Mary the Mother of Jesus. The historian Tadesse Tamrat describes Zara Yaqob's reign as marked by a sense of “religious nationalism.” Nevertheless, the subjects of Zara Yaqob were heterogeneous in language, ethnicity, and religion. Military expansion had brought under the Solomonic sway peoples speaking numerous Semitic, Kushitic, and Omotic languages and committed to distinctive religious practices, which the king himself viewed as pagan but that prevailed even in his own court.

Ethiopia's larger world in the middle of our period was marked by the crusades in which the country was not directly involved. However, in the Holy Land Ethiopians and Western Europeans became increasingly aware of each other, with the Western Europeans attaching to Ethiopia yet another myth about a powerful Christian priest-king called Prester John in the lands beyond Islam. In 1450 Zara Yaqob established direct, if tenuous, relations with Western Europe by sending an embassy to Italy.

This stage of Ethiopia's history ends properly during the reign of Zara Yaqob's great-grandson, Lebna Dengel (“Incense of the Virgin,” r. 1508–1540). The Solomonic kingdom dominated its

➤ A ROYAL BURIAL

Francisco Alvares was the chaplain to a Portuguese embassy that arrived at the court of King Lebna Dengel (1508–1540) in 1520. In the following passage Alvares describes the burial of the king's father.

“On Saturday, 12 January [1521], there was a great assembly of clergy in the said church [Mekana Sellase], and all the night they were engaged in much singing and playing of instruments and they said that they were consecrating the church. Mass had not yet been said in this church, for it was said in another small church which was close to this, in which was buried the father of this Prester [Lebna Dengel]; and he wished to remove him to the large church which he had ordered to be built and had begun in his lifetime, and which his son had finished; and they said that it was thirteen years since he died. [Jan. 15] Whilst we were standing thus . . . there passed between us and the big church all the clergy and people in a very well ordered procession, and they brought the bones of the father

of the Prester, and carried them to the big church; and there came in this procession . . . the Queens, that is, the Queen Elena, mother of the Prester, and the Queen his wife; and each of them with her black canopy for mourning. . . . The bier in which the bones came was under a canopy of gold brocade, closed in with curtains of satin. So they placed the said canopy and bier in the church, in the cross part, where we stood with the people who could not get into the church. We came to this service at sunrise, and we went away by night with [innumerable] torches.”

region almost continuously from 1270, but in 1527 Muslim principalities along the trade routes of northeastern Africa united under a charismatic leader, Ahmed ibn Ibrahim (known in Christian Ethiopian tradition as Grañ, “the left-handed”). They inflicted a military defeat on Lebna Dengel's army and ushered in a century of violent upheavals and international transformation marked by the rise of the Ottoman Turks and Portuguese expansion into the northwest Indian Ocean. This century shook to their core the institutions of Solomonic Ethiopia.

Ghana—A Trading Empire of the West African Savanna

Ghana was the first of three empires that wielded considerable economic and political influence in the West African savanna region from around the fourth through the sixteenth centuries. Ghana's rise was possible because local populations not only developed agriculture in this environmentally challenging region but also took advantage of a number of opportunities provided by the physical and economic geography of West Africa. First, the presence of a number of significant river systems, particularly the Senegal, Gambia, and Niger rivers, allowed the movement of people and goods along the savanna's east-west axis. Furthermore, the savanna was well placed to mediate between pastoralist populations in the Sahel, the semiarid area bordering the Sahara to the north, and the forest regions to the south. Thus, grains and finished goods from the agricultural and urban regions of the

savanna could be traded for forest products and gold from the south and finished goods and salt from the north. Such trade was greatly facilitated by the introduction of the dromedary, or Arabian camel, to the region sometime around 300 CE. Thus, while the beginnings of Ghana are best attributed to the skillful innovations and adaptations of local populations, the region's wealth was in no small part a result of its status as a broker between very different environmental (and cultural) zones to its north and south.

Much of what we know about the empire of Ghana in the period around the end of the first millennium comes from archeological sources and also the accounts of Muslim geographers. The historical picture created by these sources is of a decentralized trading empire that was at the peak of its power around 1000 CE. Indeed, ancient Ghana's two main cities, Kumbi-Saleh and Awdaghost, were located on the northern fringe of the savanna, suggesting that the importance of trade to the north was great enough to encourage the establishment of cities in an agriculturally marginal zone. Much of Ghana's wealth appears to have come from a direct tax on salt and gold traded into and across the empire's borders. So great was this wealth that Islamic geographers often stressed that the rulers of Ghana were among the world's richest and most powerful. The trade with the north also seems to have been a major conduit for the introduction of Islam into the savanna region.

By the eleventh century a number of factors were contributing to Ghana's decline. The drying up of the region was making agriculture, particularly in the northern savanna, less reliable. Also, the rise of the Almoravid empire to the northwest led to competition over control of major trade centers and routes running north across the Sahara. In 1076, for example, an Almoravid army seized the city of Awdaghost from Ghana, a defeat that no doubt cost the empire dearly. Furthermore, by the period of around 1100, a number of new urban complexes, such as Niani and Goa, were becoming the centers of new trading states to the east. Thus, a number of factors conspired to limit Ghana's ability to control an expanding system of trans-Saharan trade. Nonetheless, so great was the legacy of ancient Ghana that in 1957 the former British colony of

➤ AL-BAKRI, *THE BOOK OF ROUTES AND REALMS* (1067/1068)

"The city of Ghana consists of two towns situated on a plain. One of these towns, which is inhabited by Muslims, is large and possesses twelve mosques. . . . Around the king's town are domed buildings and groves and thickets where the sorcerers of these people, men in charge of the religious cult, live. In them too are their idols and the tombs of their kings. The king's interpreters, the official in charge of his treasury and the majority of his ministers are Muslims. Among the people who follow the king's religion only he and his heir apparent (who is the son of his sister) may wear sewn clothes. All the other people wear robes of cotton, silk, or brocade, according to their means. . . . [The king] sits in audience or to hear grievances against officials in a domed pavilion around which stand ten horses covered with gold-embroidered materials. Behind the king stand ten pages holding shields and swords decorated with gold, and on his right are the sons of the [vassal] kings of his country, wearing splendid garments and their hair plaited with gold. The governor of the city sits on the ground before the king and around him are ministers seated likewise."

Mali—A New Islamic State of the Western Sudan

With the decline of the Ghana empire in the eleventh and twelfth centuries, a political vacuum developed in the savanna (grasslands) and *sabel* (the semiarid “coast” bordering the southern Sahara) regions of West Africa. Numerous states vied for power and dominance as a result, each seeking to assert control over local agricultural production and also the lucrative trade in salt and gold. By the early thirteenth century, the state of Soso, under the king Soumaoro, had succeeded in subjugating many smaller states in the region near the headwaters of the Niger River.

Soumaoro’s attempt at empire building, however, was challenged by a young prince named Sundiata from the city-state of Niani. Building a

coalition of Mandinka and Soninke groups, Sundiata met and defeated his rival at the Battle of Kirina, which probably took place in 1235. Following his victory, Sundiata was named *mansa*, a term that had previously meant king but took on the implication of emperor. Sundiata established the precedent of ruling in collaboration with those who granted him sovereignty and established the Gbara (Grand Assembly) to give voice to representatives of the various groups that constituted Mali.

The oral account of the clash of Sundiata and Soumaoro was handed down through generations of griots. Combining both real history and literary drama, this epic poem is now a classic of world literature. Soumaoro is identified as the villain not only because of his alleged brutality but also because of his reliance on witchcraft for his power. Sundiata, on the other hand, is identified as good, in no small part because he eschews witchcraft for Islam. Not surprisingly, this account reflects the growing influence of Islam among the political and economic elites who lived in the urban centers of the savanna and sahel during this period. Indeed, Sundiata’s dynasty created a fictional lineage that traced their origins all the way back to Bilali Bunama, the first *muezzin* (leader of daily prayer at mosques) of Medina and Mecca who, according to Islamic tradition, had been a slave from Africa before the Prophet gave him his freedom.

The Mali empire grew to far exceed the borders of ancient Ghana. By the fourteenth century, it stretched from the Atlantic coast of the Senegambia eastward to what is today northern Nigeria. Located largely within the savanna and sahal zones, the empire drew upon a diversity of ecological zones, in no small part thanks to the presence of the Niger River, which ran west to east through much of the empire. This ecological diversity meant that the Mali empire could draw upon surpluses of rice, millet, and sorghum; meat produced by pastoralists; and fish caught from the river. Trade in gold, which came from the forest regions to the south of the empire, and salt, which came from the desert to the north, were also crucial to its economy. Although the state controlled the production of neither, its ability to tax these vital resources as they passed through its borders was a source of great wealth.

► THE GRIOTS OF WEST AFRICA

In recent years, griot (pronounced gree-oh) has become a generic term for anyone in West Africa who memorizes and relates oral histories, genealogies, and epic poems. The origin of the word is poorly understood, but as a result of its growing usage, a number of other terms (such as *jali* in southern Mande) have fallen out of use, particularly in Western scholarship.

The training and role of a griot could vary considerably. Among the Mande, a people who dominate the region of the upper Niger River in contemporary Mali and Guinea, griots have traditionally comprised a class separate from the rest of society. The children of griots were required to marry the children of griots, what is known as an endogamous community. Parents were expected to pass down the stories verbatim to their children. Within the empire-states of the savanna, such as Ghana, Mali, and Songhai, griots were supported by the state, and it was their duty to preserve and tell the histories that legitimated the ruling family. The most famous of these oral histories is the *Epic of Sundiata*.

In other societies, the position of griot was less regulated by the ruling class or state, and a griot could be anyone who took it upon himself or herself to learn and pass on oral traditions.

—Jonathan T. Reynolds

The combination of wealth and the expanding influence of Islam in the region became famous in 1324–1325 when Mansa Musa undertook the pilgrimage to Mecca. With some 5,000 attendants and 100 camel loads of gold in his train, Musa made rather a splash as he traveled through Egypt and Arabia on his way to Mecca. More so, on his return he brought books and scholars with him to Mali and undertook a state-sponsored initiative to foster more orthodox Islamic practices and greater Islamic scholarship within the empire. Among the scholars was the architect Abu Ishaq Ibrahim al-Sahili, originally from Islamic Spain (Al-Andalus), who was instrumental in creating the Savanna Style of mosques typified by the great mosque of Jenne. Musa's investment in scholarship was so great that the academy at Sankore, based in Timbuktu, eventually became one of the Islamic world's great centers of scholarship. When the famed traveler Ibn Battuta visited Mali in the middle of the fourteenth century, he recorded his favorable impressions of the Malians' dedication to Islam and the safety and security of the region (always a concern to travelers). He was, however, concerned with the so-called lack of modesty of women in the region. Indeed, while the influence of Islam was growing during this period, it is important to note that many local practices, such as allowing women freedom of mobility and association, continued.

In the fifteenth century, Mali began a long period of decline. In particular, the rise of the Songhai empire, which grew from the city-state of Gao located near the Niger Bend region in the east, gradually eroded Mali's control over production and trade. There is no clear date for the fall of Mali, but by the latter half of the fifteenth century it had been eclipsed by Songhai as the dominant power in the region.

Other Islamic States—Kanem-Bornu, and the Hausa City-States

The middle centuries of the second millennium CE saw the extensive growth of urban centers and Islamic states across the savanna and sahel regions of West Africa. In addition to the major savanna empires of Mali and Songhai, a number of other Islamic states grew up in the area around Lake Chad and also in what is now northern Nigeria and the region of southern Niger.

The process of state formation in the Lake Chad region began around 1100, with a number of Kanuri-speaking groups creating polities and competing for control of the region's fishing and salt resources and growing trade networks. Islam was also being introduced to the region by Berber traders from the Fezzan region of contemporary Libya. In the early thirteenth century, the Kanuri leader Mai Dunama Dibbalemi, of the Saifawa dynasty, reputedly converted to Islam. He then launched a series of campaigns (sometimes identified as jihads) and created the Kanem empire, which stretched from Lake Chad northward to the Fezzan. Kanem's influence to the west was largely limited by the power of the Mali empire and later by Songhai.

In the late fourteenth and early fifteenth centuries, a series of internal disputes significantly weakened Kanem's power. A Kanuri state, that of Bornu, began to grow in power in the area just to the southwest of Lake Chad. Bornu eventually grew powerful enough to dominate the entire region surrounding the lake and, as a result, is often referred to as "Kanem-Bornu." Bornu's capital, N'gazargamu, became known as an important center of Islamic scholarship.

To the west of Lake Chad, spanning the border of contemporary Nigeria and Niger, is a large Hausa-speaking region. Here, relatively fertile soils and good rainfall had long supported millet- and sorghum-based agriculture and higher-than-average population densities. In the early centuries of the second millennium CE, a number of urban centers began to develop in the region.

► LEGEND OF BAYAJIDA—THE ORIGINS OF THE HAUSA

The Legend of Bayajida recounts the founding of the Hausa city-states. In the story, a “Prince of Baghdad” named Bayajida (sometimes identified as Abu Yazid) arrives in the town of Daura and seeks water for himself and his horse. He is informed that the town’s well is guarded by an evil snake named Sarki (the Hausa word for “king”) and will only allow water to be drawn on Fridays. Bayajida goes to draw water anyway and slays the snake when it attacks him. The queen of the city is so pleased that upon determining who killed Sarki, she offers Bayajida half of her kingdom. Bayajida accepts but only on the condition that the queen marry him. Their children go on to found the major cities of the region.

The legend is generally assumed to represent both the introduction of Islam into the region and the subsequent shift from matrilineal to patrilineal succession.

—Jonathan T. Reynolds

These towns served as centers of iron, textile, and leather production and soon came to be centers of political power as well. By the middle centuries of the millennium, the major towns of the region were defined by extensive earthen fortifications. Each town was ruled by a *sarki* (king) and functioned largely as an autonomous city-state, though during the period they often paid tribute to Mali and Songhai. Among the most important of these cities were Kano, Katsina, Zaria, Gobir, and Zinder. Islam became increasingly prevalent among the urban populace during the thirteenth and fourteenth centuries. In the fifteenth century, the Islamic scholar al-Maghili visited the region and authored the text *The Obligations of Princes* for the sarki of Kano, outlining the proper behavior for an Islamic ruler.

Great Zimbabwe

The Great Zimbabwe state, which reached its peak between circa 1250 and 1350 in present-day south-central Zimbabwe, is best understood in its relationship to other Zambebian states during an extended period of time beginning in the tenth century CE. Before Great Zimbabwe, the Mapungubwe state thrived in the Limpopo Valley, and after Great Zimbabwe two strong states developed: the Mutapa state (founded ca. 1420) on the northern plateau margins and the Torwa-Changamire state in southwestern Zimbabwe. Thus, political state structures in what is today Zimbabwe developed over several centuries.

The political centralization of the small-scale horticultural settlements around Great Zimbabwe occurred during the second millennium CE and was based on control of strategic resources, such as labor, cattle, ivory, copper, and gold. It appears that the traditional kinship practices and politics of the Karanga, a people who spoke Shona, a Bantu language, aided by trade and new economic practices, as well as religious and ideological beliefs led to state formation in Great Zimbabwe.

A traditional clan-based system with a four-tiered hierarchical structure ranging from the family controlled by a male head of household to the village controlled by a headman to a group of villages controlled by subchiefs, and above this a society controlled by the king provided basic political and social organization. Social relations were based on kinship ties and were conducted through a system of obligatory duties and reciprocal functions. Extended family (including affinal [related by marriage] members, who join by association rather than by birth or marriage) and lineage members practicing shifting cultivation (moving from one farming area to another) carried the principles of kinship alliances over large areas of the Zimbabwe Plateau. The accumulation of wealth and political power in this society most likely developed based on cattle, which were a source of movable wealth. Families who owned cattle were able to gain social and political power by loaning cattle to neighbors,

➤ RIDDLE OF RHODESIA

A number of fanciful tales have been told over the past 400 years about the ruins at Great Zimbabwe. Portuguese sailors, early explorers, and colonial administrators have made claims that the ruins of Great Zimbabwe were once home to the queen of Sheba, the kingdom of Prester John (the Christian king beyond the Islamic realm), the source of King Solomon's gold, or home to a lost white tribe of Africa. These magnificent ruins have been touted by outsiders to be historic evidence of a lost civilization but not the remnants of a thriving medieval African empire.

In the nineteenth and twentieth centuries, detailing and describing the Great Zimbabwe ruins produced a spate of white chauvinistic writing determined to prove that the city and architecture were not African in origin. Among the first publications of these now discredited theories were J. Theodore Bent's *Ruined Cities of Mashonaland* (1892) and Richard Hall's *Ancient Ruins of Rhodesia* (1902). These works supported the colonial enterprise, and their myths were perpetuated by postcards such as the one developed in 1938 by the Rhodesian government showing the ghost of the queen of Sheba standing at Great Zimbabwe with a subservient African kneeling to offer her gold and a question mark placed above the Zimbabwe bird. Today these myths are still given credence in some circles, but an African origin thesis for Great Zimbabwe has been convincingly demonstrated.

—Lorna Lueker Zukas

Poster issued by the Southern Rhodesia Publicity Office in 1938. (Garlake, P.S. Great Zimbabwe, 1973)

who were then obligated to provide support and assistance in return. Cattle forged new political relationships and incorporated outsiders into existing political and social networks.

Cultural practices and religion seemed to have aided state formation at Great Zimbabwe. Through kinship and trade networks, Shona chiefs possessed vast knowledge of the Zimbabwe Plateau and a wide area of south-central Africa. As Bantu speakers, their cultural and linguistic affinity to other peoples enabled many communities to share in and contribute toward a greater Shona common good. In addition, a widespread belief in a High God, deep respect for ancestors,

and the practice of spirit possession helped create political unity among dispersed people.

By the twelfth century, the inland empire on the Zimbabwe Plateau was ruled by the Karanga (Shona) people who organized and facilitated regional and long-distance trade with a greater Indian Ocean world. Trade provided new forms of social relations and enabled individuals to rise to prominence. Key markets, or trading centers, were established to help move goods and enabled the Karanga (Shona) to keep in touch with local, regional, and perhaps international events. The resultant society was highly structured with a powerful centralized authority, and

it featured a complex division of labor with farmers, pastoralists, artisans, craft workers, and priests (spirit mediums). By the thirteenth century they had built Great Zimbabwe and established it as the seat of a vast African state that controlled trade routes from the interior of southern Africa to the East African coast. Portuguese documents suggest that Great Zimbabwe was strategically placed to exploit and dominate important grazing lands and to control possession of the gold fields.

The ancient Great Zimbabwe state was unable to sustain itself, and after about 200 years, around the mid-fifteenth century, internal dissent and complications in subsistence production led to the abandonment and breakup of the state. Two smaller states emerged that left similar stone ruins: the Torwa state marked by the Khami ruins near present-day Bulawayo and a smaller state known as the Mutapa state with a capital at Fura in northeastern Zimbabwe.

Excavators of the Great Zimbabwe ruins have found seven-and-a-half carved soapstone birds. These birds are thought to be symbols of religious or political power. As religious symbols, the birds are thought to link the king to spirits of past kings who could be called upon for help. The political significance of the birds began when the first one was stolen from the ruins in 1889 and was purchased by Cecil Rhodes. The bird was used by Southern Rhodesian white settlers on the Southern Rhodesian coat of arms and currency. In 1980 the new African government named the newly independent nation Zimbabwe and reappropriated the bird as a symbol of power handed down from ancient African kings. The bird is now on the Zimbabwe flag, is used on the front of coins, and is frequently used as a symbol of national pride.

Buganda—The Founding of a Kingdom and Its Constitution

Buganda, the largest and most influential kingdom in what is today Uganda (Uganda being the Swahili variation of the name “Buganda”), came into existence in the late 1300s with Kintu, a semilegendary person, as its founder and crafter of the kingdom’s first constitution, parts of which are still in use. Because the story was handed down orally, several versions exist detailing the kingdom’s founding. However, there is agreement that the area of Uganda today known as Buganda was inhabited by a group of Bantu people known as Baganda before the 1200–1500 general migration and settlement of the area.

Although these people shared a language and cultural practices, they were not organized in one central political unit; instead, they grouped themselves into ancestral clans, each headed by a hereditary clan leader. The clan leader had various responsibilities, including protecting the clan and its traditions, settling disputes among clan members, and day-to-day overall administration of the clan. Generally all clans were considered equal and independent, but every now and then a militarily strong clan leader would annex a number of clans and declare himself their overall leader. One such leader, Bemba, was in charge of 6 clans when a stronger leader, Kintu, with control of 13 clans, took over leadership of the region.

Intriguing versions abound in the oral traditions regarding the origin of the name “Buganda” and the identities of Bemba and Kintu. We are still uncertain whether Bemba and Kintu were related, whether Kintu was born in Buganda and grew up in the northeast, or whether he was an invader. What seems certain is that Bemba was harsh and hated by those he ruled, some of whom helped Kintu to defeat him. After overthrowing Bemba, Kintu consolidated his power over the 19 clans by convening the first-known constitutional conference in Buganda. Kintu in-

vited the clan leaders to this conference, and in consultation with their people they openly discussed and crafted the kingdom's first and only constitution, articles of which are still in use although it was never put on paper. Fourteen political offices were created, including the most important one up to today, that of *katikkiro* (prime minister), and the officers were appointed by Kintu from the assembled clan leaders.

The 14 political officers constituted the first administrative team of the kingdom headed by the prime minister, and Kintu became the first *kabaka* (king). Under this constitution, clan leaders retained their responsibilities, including what is still today the most important task of a clan leader, that of sustaining and preserving the clan's identity, traditions, and sense of pride. By preserving the clan system and sharing power with his appointed chiefs, Kintu created a significant and strong sociopolitical structure with a political component headed by him and a social component under clan leaders. Although these two components functioned effectively side by side, Kintu has to be credited for having empowered the clans by making them strong, viable administrative structures. The clan system has historically sustained the identity, pride, and integrity of the Baganda people through very hard times, especially when the political component was either too weak to function effectively or not in existence.

➤ BAGANDA SOCIAL STRUCTURE

The Baganda clan structure is an intricate hierarchical unit headed by a king. But even in the absence of a king, the group keeps functioning because of the clan administrative system. Within the group are specific clans (*bika*), each headed by a hereditary clan leader; each clan has its own distinct set of names as well as its own headquarters, motto, totem (which is the clan name), and subtotem. Furthermore, clan members cannot intermarry. A clan is divided into several *masiga*, or subclans, each headed by a clan elder. Each *siga* (singular for *masiga*) is comprised of various *mituba* (family trees), and each *mutuba* (singular for *mituba*) is further subdivided into many *nyiriri* (family lineages-lines) with each *lunyiriri* (singular for *nyiriri*) being made up of numerous families (*enda*). This is information that every *muganda* (singular for Baganda) person has to know, and a *muganda* person introducing himself or herself to another *muganda* is supposed to state all the categories that he or she belongs to. For example, a *muganda* might introduce herself as Nnamakula of *lugave* clan and then state the names of her various division leaders beginning with the clan head down to her father who is head of the *enda*. This structure is the essence of Baganda, not some physical space on a map.

■ Introduction: Islam—Ideally a Single Community, in Reality Diversity

The ideal of Islam, as articulated in the Quran and Hadith (the traditions of the Prophet and his Companions), is that just as Allah—the God—is indivisible, so His people must be one, a single community, or *Umma*, gov-

erned by His law and those empowered by Him to lead that community. Originally that leader was the Prophet and the single community was Medinat al-Nabi, the City of the Prophet, better known as Medina. At the time of the Prophet's

death in 632, however, ruptures were already appearing within the Umma, and they became larger and more irreparable in the years between 632 and 661 as the schism between Sunni and Shia took shape.

As the entries and sidebars under this topic show, Islam between 1000 and 1500 was divided into a dizzying collection of polities along sectarian, political, ethnic, personal, and dynastic lines. Indeed, for much of the tenth century and part of the eleventh century, there were three competing caliphates, each presided over by a monarch who claimed to be the rightful caliph, or deputy, of the Prophet: the Sunni Abbasid caliph in Baghdad, the Sunni Umayyad caliph in Córdoba, and the Shia Fatimid caliph in Cairo. Each of these caliphates in turn suffered fragmentation as competing Muslim leaders and states divided and redid them in the course of the eleventh and twelfth centuries.

The same was true for newcomers to Islam and new Muslim states. The Seljuk Turks were divided into several polities, the two most important being the empire of the Great Seljuk and the empire of Rum. In Iberia and Sicily, two lands in which Islam was progressively losing ground against Latin Christendom from the mid-eleventh century onward, much of that regression and eventual total defeat was due to severe divisions among the Muslim principalities and other entities within these lands. The same was true for the initial successes of the Latin crusaders, especially during and shortly following the First Crusade (1096–1099). The capture of Jerusalem and the carving out of four crusader states in the eastern Mediterranean were made easier, and probably even made possible, by the severe factional divisions within Islam at that time and in that region. The fact that the Latin kingdom of Jerusalem was able to hold on for two centuries was also due, at least in part, to factional splits among the would-be champions of Islam. Often enough, Muslim princes allied with Frankish lords in their struggles with fellow Muslims in Iberia, Sicily, and the eastern Mediterranean.

Indeed, some jihadist Muslim warriors were equal-opportunity campaigners, ferociously warring against and butchering large numbers of both Christians and Muslims. The most notori-

ous of these was Timur-i Leng, or Tamerlane. Before Tamerlane there were the Assassins, a Shia Ismaili entity that compensated for its small numbers by employing terror: the terror of assassination, a word derived from the name given them by their enemies. The numbers of their victims were not that great, especially when compared to the state-sponsored terror of warrior-polities such as the Mamluks of Egypt and Syria, but the fear they inspired was far out of proportion to their murderous reach. And the vast majority of those who fell to Assassins' knives were Muslim enemies, usually Sunni Muslims. Even the great Saladin, sultan of Egypt and Syria and the man who restored Jerusalem to Muslim control, was threatened by the Assassins and became so terrified by that threat that for the rest of his life he left them in peace.

Peace (*salaam*, the traditional Arab greeting and blessing) has always been an ideal of Islam, but more often than not the reality was division, distrust, and even war among its many different groups and states. But the same was true for Christendom during this half millennium.

—*Alfred J. Andrea*

Abbasid Caliphs and Seljuk Sultans—A Shift of Power in Southwest Asia

From their capital of Baghdad (established in 762), the Sunni Abbasid caliphs ruled through the strength of their armies, armies that until the reign of the eighth caliph al-Mutasim (r. 833–42) were largely composed of Arabs from Khurasan in northeastern Iran. However, by the middle of al-Mutasim's rule, Turkish military slaves (*mamluks*) began to replace the standard tribal armies in defense of the caliphate.

In the tenth century, Shia Muslims—largely politically quiescent until this point—began to dominate the caliphate. The Buyid dynasty (932–1061), which belonged to the Shia sect known as Twelvers, held the Sunni caliph as a virtual prisoner in Baghdad. It is into this environment that the Seljuk Turks arrived. While Turkic peoples had already held important military and political posts in the caliphate, their entry into Islamic lands prior to the Seljuks was largely piecemeal.

Thus, the coming of the Seljuk Turks marked the first mass migration of a nomadic tribally based Turkic group into Islamic lands.

The Seljuks were members of the Oghuz Turkic branch, one of six branches that ethnographers use to classify the Turkic peoples. Tradition holds that the Seljuks converted to Islam in 985 at Jand, an important trade center on the lower Syr Darya (Jaxartes River) in Central Asia. Seljuk ibn Duqaq, the eponymous founder of the Seljuk tribe, was a military commander under the pagan Turkic ruler—known as the Yabghu—of the region. However, after a falling out with the Yabghu, Seljuk fled with his flocks and followers to Jand and offered to convert to Islam in exchange for defending the city from pagan Turkic raiders under the authority of his former leader. Over the next half century, the Seljuks and the armies of the Yabghu battled for control of the region.

From this new area, the Seljuks hired out their services to various Muslim polities in the region, including the Samanid Persians (819–1005) and the Qara-Khanids, their eventual successors. However, this period of consolidation was not kind to the Seljuks. Constantly changing allegiances and an environment rife with political instability meant that they faced an almost constant state of privation. These hardships, though, also served to forge the Seljuks into an effective and efficient military power. The great power of the region was the Ghaznavid empire (962–1186), centered in Afghanistan and made extremely wealthy through its conquests of sections of the Indian subcontinent. At the height of their power under the great ruler Mahmud of Ghazni (r. 971–1030), the Ghaznavids in 1025 invited some of the Seljuks into Khurasan to help maintain their authority. These Seljuks ultimately proved to be unruly and were forced out by Ghaznavid forces. However, the political instability that accompanied the death of Mahmud just five years later allowed the Seljuks to reenter Khurasan and quickly subdue the province.

Intermittent fighting between the two groups culminated with the Battle of Dandanqan in 1040. It proved a decisive victory for the Seljuks, closing off all but the Indian subcontinent to the truncated Ghaznavids while providing the Seljuks

Seljuk fortress in Ephesus (in present-day Turkey), dating from the eleventh century. After conquering much of Southwest Asia in the early part of the century, Seljuk Turks defeated Byzantine troops at the Battle of Manzikert in 1071. They eventually swept through much of Anatolia, including Ephesus and other Byzantine cities along the Aegean coast. (Peter Long)

➤ TUGHRIL BEG

Abu Talib Muhammad b. Mikail was born toward the end of the tenth century in the Central Asian steppes, north of the Transoxiana Valley. After the death of his father Mikail, Abu Talib Muhammad was brought up by his grandfather, Seljuk b. Duqaq, in Jand. In his youth, Abu Talid Muhammad received the name Tughril, which was Old Turkish for the crested goshawk, a formidable bird of prey on the steppes. As was the nature of Central Asian steppe peoples, political sovereignty was not through primogeniture (passed on to the eldest male heir) as in some societies. Rather, political authority was corporate in nature. Any male from the ruling lineage had the theoretical right to rule. It seems that Tughril and his brother Chagri ruled jointly. In practice, they split their patrimony, with Chagri the ruler (or beg) of the eastern territories and Tughril the beg of the western lands. After his liberation of the Abbasid caliph al-Qaim, the newly titled sultan Tughril Beg attempted to unite his house with that of the caliph through a political marriage. However, the caliph refused for two years until Tughril Beg threatened to confiscate caliphal property. The marriage, though, was never consummated, and Tughril Beg died in 1063 without a male heir.

—Rasheed Hosein

with the core territories that would form the Great Seljuk empire. From this center in Khurasan, a Seljuk group under Tughril Beg (990–1063) began to prosecute attacks against the Shia Buyids in the name of liberating the Sunni caliph, while his brother Chagri Beg maintained control at their newly won capital of Nishapur. In 1055 the Seljuks took Baghdad and effectively broke Buyid dominion over the central regions of the caliphate. As a result, the caliph al-Qaim (r. 1031–1075) granted to Tughril Beg the title of *sultan* (holder of temporal power), and the Seljuk coins of this period were the first to use that title officially.

Alp Arslan (1029–72), the son of Chagri Beg and the second sultan of the Seljuks, increased these holdings substantially in the West with the conquest of Armenia and Georgia in 1064 and the invasion of the Byzantine empire in 1068. Skirmishing on the margins of Anatolia for the better part of two years, the Byzantines, under the direct command of Romanus IV Diogenes (r. 1068–1071), finally met the Seljuks at Manzikert in the Armenian region of eastern Anatolia in 1071. The resulting Seljuk victory opened up the Anatolian peninsula to the Seljuk Turks and greatly weakened the prestige of the Byzantine empire. The net effects of these Seljuk successes were many. Primarily, the victories marked the formal introduction of Turks into Anatolia, which now forms about 90 percent of the landmass of the present-day nation of Turkey. The victories likewise opened the way to future migrations by Turkic peoples such as those who followed Osman Bey (1258–1326), the founder of the Ottoman dynasty, into the region. Finally, the Sunni Seljuks reduced the threat of Shia control in Southwest Asia for more than 400 years until Shah Ismail I (r. 1487–1524) made Shia doctrine the official state religion of the Safavid Persian empire (1501–1736) in the early sixteenth century.

The Great Seljuk Empire

The migration of the Turkic Oghuz peoples out of Central Asia in the tenth century fundamentally changed the nature of the Islamic world. During the period directly preceding this relocation of Turkic peoples, there was great political and religious strife within lands historically subject to the caliphate, as families and factions jockeyed for power over lands previously subject to the caliphs. However, under the Oghuz Seljuks, most of the Islamic world of southwestern Asia was once again unified and subject to the religious authority of the Abbasid caliphate but now under Seljuk political-military hegemony. In this way, the nature of power and authority was radically altered, setting the stage for the future development of the Middle East under the great empires of the early modern period.

Under the Seljuks, the Sunni nature of the caliphate was protected. Prior to their entry into the Islamic world, the Seljuks had converted en masse to the Sunni creed and presented themselves as the champions of an isolated and marginalized Abbasid caliphate. In the tenth century the core lands of the caliphate had been previously dominated by Shia groups such as the Ismaili Fatimid dynasty (969–1171), which claimed universal authority by its adoption of the title of caliph, and the Buyid dynasty of Iraq and Iran (932–1061), which was a Twelver Shia dynasty and kept the caliph as a virtual prisoner in Baghdad. The Seljuk invasion had two major repercussions. First, it restored the Sunni nature of the core Islamic lands, renewing the legitimacy of the previously embattled Abbasids. Second, it created a new aristocratic lineage around which power and authority could coalesce.

Prior to the advent of the Seljuks, power and authority were derived from one's lineage vis-à-vis the Prophet Muhammad. According to Sunni theory, a ruler had to belong to the tribe of Quraysh (the Prophet's tribe), as was the case of the Rashidun ("Rightly Guided"; 632–661), Umayyad (661–750), and Abbasid caliphs. The Shias were even more restrictive, recognizing only direct descent from the Prophet Muhammad's family through the marriage of Ali, who was the Prophet's cousin, and the Prophet's daughter Fatimah. The Seljuks' tremendous suc-

cesses, however, now imbued the lineage of their patriarchal ancestor Seljuk b. Duqaq with a similar authority. Previously, caliphs had appointed Turks to govern territories, and Turkish military commanders often held great sway over weak caliphs, but the idea that a Turk had the right to temporal rule was established with the Seljuk success and would last until the early twentieth century.

Historians mark the beginning of the Seljuk rise with their victory at Dandanqan in Khurasan (northeastern Iran) in 1040 over the previously dominant Ghaznavids (962–1186). Their success in this battle opened up the heartland of Dar al-Islam to their influence and formed the core of the Great Seljuk empire (1040–1194), which at its height stretched from eastern Anatolia and northern Syria to the western fringes of modern Pakistan. At this time the Seljuks were jointly ruled by Tughril Beg (990–1063), who earned the title of sultan (the possessor of temporal power) after liberating the Abbasid caliph in 1050 and who continued to campaign, and his brother Chagri Beg (d. 1060), who maintained authority over the Seljuks' eastern lands from Nishapur in Iran. This feature, known as corporate sovereignty, was a hallmark of Central Asian peoples. Essentially, any Seljuk prince (be he a son or brother of the previous ruler) was entitled to territory and the right to rule. What was uncommon was the degree of cooperation that existed between the two brothers, as this system tended to lead to civil war as claimants tried to reconstitute the original patrimony under a single individual's control.

With the deaths of Chagri and Tughril in the early 1060s, Alp Arslan (1029–1072), the son of Chagri Beg, emerged to claim the title of sultan and to unite the Great Seljuk empire after a brief period of instability, ruling from Chagri's capital of Rayy (near present-day Tehran). The basis for the Seljuk military successes prior to Alp Arslan had been the use of seminomadic Oghuz Turkic groups, of whom the Seljuks were but one. However, while effective in warfare, these elements were not easily settled, preferring instead a life of raiding and campaigning. Their support of the Seljuk cause was contingent upon the ability of the Seljuk ruler to provide an outlet for these martial tendencies. Toward the end of Alp Arslan's

➤ ADMINISTRATION IN THE GREAT SELJUK EMPIRE

Two administrative institutions made it possible for the Great Seljuk empire to achieve a reasonable level of short-lived but effective centralized authority. The first was the *dargah*, a military and judicial council that essentially acted as the sultan's Privy Council. Drawn from the most powerful military commanders, it allowed the great emirs access to the sultan while providing the sultan with a measure of control over these commanders. The second was the *diwan*, or bureaucracy. The bureaucracy was staffed by able Persians, such as the renowned scholar and educator Nizam al-Mulk (1018–1092) who administered the diwan for Sultan Malik-Shah until his murder in 1092, apparently at the hands of an Ismaili assassin. Significantly, 1092 was also the year in which Sultan Nizam al-Mulk died, and as such it was a watershed in Great Seljuk fortunes. Until the empire's precipitous decline after 1092, however, these two bodies helped bind together a state that was by its very nature tenuous and unstable. More significant, the administrative structure represented by these two institutions would be the hallmark of subsequent Iranian dynasties until the nineteenth century.

—Rasheed Hosein

reign, the Oghuz Turks reached Byzantine Anatolia and began to raid, as was their custom. The sultan marched west to restrain these incursions in order to maintain his truce with the Eastern Roman, or Byzantine, empire. However, the Byzantine emperor Romanus IV Diogenes (r. 1068–1071) also sent his forces into eastern Anatolia to curb these raids, which the Seljuks viewed as a breach of the truce. Seljuk and Byzantine forces met at the Battle of Manzikert (1071) in eastern Anatolia, where the Seljuks inflicted the worst defeat on an eastern Roman army since the Battle of Adrianople in 378. During the course of fighting the Byzantine army was smashed, the emperor was captured, and control of central and eastern Anatolia was lost forever. Despite continued existence for almost another four centuries, the Byzantines would never again be able to field as large an army in battle.

With the death of Alp Arslan in 1072, his son Malik-Shah (r. 1072–1092) achieved the title of

sultan and control of the Great Seljuk empire after a brief interregnum. In many ways the reign of Malik-Shah marks the apogee of the Great Seljuk empire. Malik-Shah prospered from the maturation of two key institutions, the *dargah* and the *diwan*, which helped to centralize Seljuk rule.

Despite these centralizing institutions, the Great Seljuk empire was irrevocably fractured upon the death of Malik-Shah. Claiming the right to rule under the theory of corporate sovereignty, the sultan's brother Tutush I (r. 1092–1095) succeeded him in Syria. In the east the situation was far more tenuous, as Malik-Shah's son Mahmud I (r. 1092–1094) earned the title of sultan but was challenged by his brothers Barkiyaruq (r. 1094–1105) from western Iraq, Muhammad Tapar I (r. 1105–1118) from Baghdad, and Ahmad Sanjar (r. 1118–1153) from Khorasan, each of whom acted as the titular head of the fractured state at various times over the next half century. After the death of Ahmad Sanjar, the state continued in a greatly diminished capacity for another 40 years,

until it was subsumed by the Khwarezm shahs from eastern Iran (1077–1231).

The Seljuk Sultanate of Rum

The death of Malik-Shah, the Great Seljuk sultan, in 1092 opened the door for remote lineal relations to peel off peripheral territories from the central state. Sulayman b. Qutulmush (r. 1077–1086), a distant cousin of Malik-Shah, founded the sultanate of Rum (1077–1307) largely by chance and circumstance. During the interregnum immediately following the death of Alp Arslan, all of the Seljuk-appointed military commanders returned to the capital of Rayy, leaving their regiments in the field. As a result of Malik-Shah's eventual triumph over all other claimants to the title of sultan, the losers were banished to the remote areas of the empire. Sulayman ended up in Anatolia and was able to unite under his banner the Oghuz tribesmen in the region. With this fortunate turn, the Seljuk prince was able to carve out a substantial holding in Anatolia, and by 1175 he had conquered much of central Anatolia, including the key cities of Iconium (Konya) and Nicaea (Iznik), naming the latter as his capital. In 1077 Sulayman officially broke with the Great Seljuk empire, proclaiming himself sultan of the Seljuk sultanate of Rum (Arabic for “Rome,” the term by which the Byzantine empire was referred to in Arabic sources).

With the Byzantine empire still in disarray from the defeat at Manzikert, it sued for and received peace from Sulayman. Turning his attention eastward, Sulayman looked at the lands held by his rival Malik-Shah and sought to bring them under his hegemony. After successes over the Armenian kingdom of Cilicia (1078–1375), wherein Sulayman gained control of the city of Antioch (present-day Antakya), he came into conflict with the Syrian Seljuk commander Tutush I, the brother of Malik-Shah. In the ensuing battle Sulayman was killed, and his son was sent into Malik-Shah's custody at Rayy, where he stayed until the Great Seljuk sultan's death in 1092.

During the confusion of the interregnum period after Malik-Shah's death, Sulayman's son Kilij-Arslan I (r. 1092–1107) escaped captivity and succeeded in reestablishing his father's patrimony in Anatolia. However, with the advance of the crusaders in 1097, Kilij-Arslan I was forced to withdraw from his father's capital of Iznik

(Nicaea), choosing instead Konya for defensive reasons. Having established control of the central and eastern portions of the Anatolian plateau and agreeing to terms with the crusader-strengthened Byzantine empire, Kilij-Arslan I again tried to expand into the Great Seljuk empire. However, at the Battle of the Khabur River in 1107, he was defeated and killed by the Great Seljuk sultan Muhammad Tapar I. The resulting anarchy in Anatolia allowed the Byzantines to strengthen their control over the coasts, pushing the Seljuk borders farther back.

For the next decade, power among the Seljuks of Rum was wielded ineffectively by Kilij-Arslan's eldest son Shahanshah (r. 1110–1116), although effective power remained with the Great Seljuk sultan. With the accession of Rukn al-Din Masud (r. 1116–1155), however, the picture began to change. The reign of Masud I marked a high point for the Seljuks of Rum, for its strength and longevity, coupled with the internal instability of the Great Seljuk empire, meant that Masud I was able to finally peel Anatolia away from the core Seljuk state. Under his able administration the Seljuks of Rum were able to reverse all of the losses of the previous years, as they were able to absorb vast areas of the Anatolia Peninsula.

With the death of Masud I in 1155, the succession passed to Kilij-Arslan II (r. 1156–1192) after a brief interregnum. Looking to secure his own power, Kilij-Arslan II sought the aid of Nur al-Din Zangi (r. 1146–1174), the *atabeg* (military commander and vicegerent) of Aleppo and Mosul in Syria. The office of the *atabeg* would mark the low point of the Great Seljuk sultans and provide the Seljuks of Rum with a critical ally in maintaining their independence. Because the Seljuks had established their right to rule by virtue of their noble lineage, the sultans of Rum were nominally in command throughout the empire. Increasingly, though, many young Seljuk princes came to rule outright through the practice of corporate sovereignty. To aid these young princes, the Seljuk sultan would send *atabegs* as tutors to instruct them in how to rule. Often these tutors would be further bound to the ruling family through a political marriage to the young prince's mother. However, soon *atabegs* were assuming total control of territories, eventually removing their princes outright.

➤ KONYA (ICONIUM), THE CAPITAL OF RUM

Located on a broad treeless plain in central Anatolia, Iconium (present-day Konya) was a garden city due to the presence of an oasis. The world traveler Ibn Battuta (1304–1377) described the city, during his visit there in the late 1320s, as a verdant city with broad avenues and many markets. The ancient city of Iconium became the capital of the Seljuk sultanate of Rum in 1097 after the original capital of Iznik (ancient Nicaea) became impossible to defend. Called Konya by the Seljuk Turks, it reached its zenith between 1205 and 1239 during the Golden Age of Kay Khusraw I and his sons. At this time, the far-sighted trade policies of the Anatolian Seljuks created vast wealth through the maintenance and development of caravansaries, using them to encourage overland trade through their lands.

Under Sultan Ala al-Din Kay Qubadh I (r. 1219–1236), known to the West as Sultan Aladdin, the city became a true capital. Possessing a passion for building, the “Seljuk Justinian” used the wealth generated by trade to beautify the city, sparking the old Turkish phrase “see all the world—but see Konya.” The city attracted the artistic and religious elite of its age, including the great mystics Ibn Arabi (1165–1240) and Jalal al-Din Rumi (1207–1273), the latter being interred there. However, the situation was not meant to last. With the conquest of the Seljuks by the Mongols in 1243, the city faded in political and economic importance, serving only as a regional center by the Ottoman period (1300–1924). It became, however, and remains to this day a major center of pilgrimage because of al-Rumi’s tomb.

—*Rasheed Hosein*

Nur al-Din had replaced the Seljuks in the regions of northern Iraq and northern Syria as hegemon. Actively involved against both the Frankish states and the heterodox Fatimid caliphs of Egypt (969–1171), the atabeg was happy to make peace with Kilij-Arslan II. This allowed the Seljuks of Rum to deal with the Byzantines, who were again looking to reclaim lost territory. The two sides would meet at the Battle of Myriokephalon (1176), which ended as a major Seljuk victory and arguably was even more pivotal than Manzikert a century earlier. This solidified the

Turkish presence in Anatolia. The period after Myriokephalon looked to be one of stability for the Seljuks of Rum. The Great Seljuks were in their final days, with the last Great Sultan passing in 1194, while both the Byzantines and the Franks were recovering from the Muslim reconquest of Jerusalem after the Battle of Hattin in 1187. However, despite these positive external developments, the period directly preceding the death of Kilij-Arslan II in 1192 would prove to be one of great internal turmoil. The aging sultan would lose control of his sons, throwing the state into jeopardy. The resulting civil war left the sultanate of Rum fragmented and weakened, allowing the crusaders to temporarily occupy Konya in 1190.

A brief reprieve was given to the Seljuks of Rum when the crusaders of the Fourth Crusade conquered their coreligionists in Constantinople in 1204 instead of their Muslim foes. Taking advantage of the brief reprieve, the Seljuks reconsolidated their rule during the second of Kay Khusraw I’s two reigns (r. 1192–1197 and 1205–1211). It is at this time that two domestic policies of the Seljuks of Rum came to fruition, leading to a golden age for the dynasty. Due to the destabilization of trade caused by constant warfare, the Seljuks began to refortify caravan stops (caravansaries) throughout Anatolia and obtained trade deals with Venice, all with an eye to diverting trade through their lands. This created great wealth for the Seljuk sultans. Their other policy would prove more durable and pragmatic.

Stretching back to the Seljuk victory at Manzikert, which opened up Anatolia to Turkish migration, the sultans distributed land seized from Byzantine aristocrats, as well as ownerless lands to the landless inhabitants, thereby offering them a livelihood and a means to increase their standing. These lands, classified as *miri* (state territory), still belonged to the Seljuks, but each tenant held as much land as he could work. This formed the basis of both Seljuk and the later Ottoman agricultural policy, allowing the sultans to win over native populations to their cause and providing a means to sedentarize the incoming Turkic peoples from Central Asia.

This golden period ended just prior to the death of Kay Khusraw II (r. 1237–1246). In the last days of his rule, the Seljuk sultanate of Rum

would be too fractured to be effectively ruled by one ruler. This led to periods where there were cosultans followed by general instability throughout the Seljuk territories, lasting until the Mongol entrance into Seljuk lands after their victory at Kose Dagħ (1243). Thereafter, the Anatolian Seljuks would serve as Mongol auxiliaries, paying tribute to the Mongol il-khanate of Persia (1256–1353) until the last Seljuk ruler died in 1303 as a mere figurehead.

Baghdad, 1000–1258—Capital of a World Empire?

Between 1000 and 1258, the Abbasid caliph in Baghdad lost most of his decision-making power, becoming a local puppet ruler with primarily symbolic religious authority. The caliphate experienced the rise of a military rule along with a decline of the economy and agricultural production, as well as political fragmentation, bureaucratic decentralization, religious divisions, and a series of Turkish invasions from Inner Asia.

Around 1000 a recently Islamized Turkish nomadic tribe, known as the Seljuks, emerged in the region of Bukhara (in present-day Uzbekistan) and rapidly started expanding its power into western Iran, Azerbaijan, and Iraq. The Seljuks reached Baghdad in 1055, but instead of attack-

ing the city and destroying the caliphate, they declared themselves "protectors and promoters" of Sunni Islam and assured their loyalty to the caliph. In return, by way of a retrospective act of legitimizing the usurpers, the caliph recognized the Seljuk ruler as "sultan" (holder of power) and honored him with all due regalia. The newly instated sultan received seven robes to symbolize the seven climates, two swords for his rule over the eastern and western empire, and the duty to rule according to Sharia (Islamic holy law). The unruly nomadic warriors were sent farther west, to Anatolia. In 1071 at the Battle of Manzikert, in a region of eastern Anatolia known as Greater Armenia, they defeated the Byzantine emperor and his army and opened the entire Anatolian Peninsula to Turkish migrations and settlements, thereby beginning the long process of ethnic and cultural transformation in what is today Asiatic Turkey.

While the unity of the Abbasid empire disintegrated, different regional identities and local cultural expressions became increasingly possible. Baghdad saw itself competing with cities such as Cairo, Fez, and Cordova in the West and Bukhara, Samarqand, and Isfahan in the East. As Baghdad declined as a political and administrative center, its role as a religious and intellectual capital remained. Historical writing, chronicles, geographies, and biographies surged, and Baghdadi poetry and elaborate rhymed prose flourished, with examples such as the *Maqamat* (*Assemblies*) of al-Hariri (d. 1122), a collection of witty adventure tales. As centers for religious and legal instruction, the *madrasas* in Baghdad continued to grow and thrive. Nizam al-Mulk (d. 1092), the leading *wazir* (chief minister) of the early Seljuks, was known for building several schools and endowing them with funds. He was thus able to use the schools as a way to influence the population, control major legal and theological institutions, and create an education system that provided highly educated young men to fill positions in the government and administration.

The madrasas housed the four Sunni schools of legal interpretation and their scholars, judges, and students. The madrasas taught subjects related to the Quran, Hadith (traditions), Arabic grammar, jurisprudence, theology, and sometimes Sufism. The Nizamiya School in Baghdad, named

➤ EXCERPT FROM NIZAM AL-MULK, *SIYASAT NAMA*—THE BOOK OF GOVERNMENT

In *The Book of Government*, Nizam al-Mulk, the leading chief minister of the early Seljuks, defined the image of a just ruler and provided lessons for statecraft. In this excerpt, al-Mulk emphasizes the grace that Allah reserves for kings who protect and show compassion toward their subjects:

“It is for kings to observe His pleasure (His name be glorified) and the pleasure of The Truth is in the charity which is done to His creatures and in the justice which is spread among them. A kingdom which is blessed by its people will endure and increase from day to day, while its king will enjoy power and prosperity; in this world he will acquire good fame, in the next world salvation, and his reckoning will be easier. Great men have said, ‘A kingdom may last while there is irreligion, but it will not endure when there is oppression.’ . . .

Of a certainty The Master of the World (may Allah perpetuate his reign) should know that on that great day he will be asked to answer for all those of God’s creatures who are under his command, and if he tries to transfer [his responsibility] to someone else he will not be listened to. Since this is so it behooves the king not to leave this important matter to anyone else, and not to disregard the state of God’s creatures. To the best of his ability let him ever acquaint himself, secretly and openly, with their conditions; let him protect them from extortionate hands, and preserve them from cruel tyrants, so that the blessings resulting from those actions may come about in the time of his rule, if Allah wills.”

—Hend Gilli-Elewy

Nizam al-Mulk, *The Book of Government, or Rules for Kings: The Siyasat-Nama or Siyar al-Muluk*, translated by Hubert Darke (New Haven, CT: Yale University Press, 1960), 12–13.

after the wazir, became a prestigious institution and attracted scholars from across the Islamic world such as al-Ghazzali (1058–1111), a famous legal scholar, philosopher, and Sufi master. The new Turkish leaders also promoted a new literary genre known as Mirrors for Princes—books of advice on ethics, good government, and state-

craft. Nizam al-Mulk composed a treatise called *The Book of Government* in which he defined the image of a just ruler, gave examples of ancient rulers, and provided lessons in statecraft. Al-Ghazzali also composed the *Book of Counsel for Kings* with a much more religious content.

Although the Seljuks envisaged a universal empire united by Islam, Iraq’s economy and bureaucratic structure were too weak to support a centralized government. Furthermore, the nomadic heritage of the Seljuks and their Turkish tribal concept of sovereignty and succession led to further provincial fragmentation and rivalry. A last attempt to revitalize and strengthen the caliphate in Baghdad came under Caliph an-Nasir li-Din Allah (r. 1180–1225). He associated himself with a group called the *futuwwa* (youthful nobility) in Baghdad. Previous caliphs had tried to control the doings of this political warrior band that had often terrorized Baghdad inhabitants. An-Nasir now reversed this policy; he stressed the Sufi-inspired Muslim virtues of courage, chivalry, and manliness and created the image of a disciplined, virtuous Muslim knightly order. He became their leader and ordered the aristocracy to become members as well. With the *futuwwa* as his new army, the caliph was successful in uniting many provincial rulers and emirs behind him and strengthening Baghdad’s role, but new invasions from the east ended all hope. The Mongols were advancing westward; they reached Transoxiana in 1219 and stood before the gates of Baghdad in 1258, marking the end of the Abbasid caliphate.

The Order of the Assassins— Terrorist States in Iran and Syria

Originally known as Al-Dawa al-Jadida (The New Preaching), the Order of the Assassins were Nizari Ismaili Shia who carried out high-profile political murders from the late eleventh century to the late thirteenth century. The sect began in northern Iran as a militant messianic form of Shia that, under the leadership of a Persian poet of Arab descent, Hasan-i Sabbah (ca. 1048–1124), opposed the rule of Sunni Seljuk Turks.

Due to a succession quarrel within the Shia Fatimid dynasty of Egypt, the New Preaching became embroiled in Islamic politics far beyond its place of origin. Over time, control of the Fatimid government had passed to powerful Turkish viziers who were Sunni Muslims, and Nizar, the presumptive heir and eldest son of the Fatimid caliph, conspired to retake control in 1094. The New Preaching joined Nizar's movement. Nizar, however, was defeated and killed, and continuing attacks by the government in Cairo as well as by the Seljuks kept Hassan-i Sabbah's followers constantly on the defensive. Although efforts to wipe them out failed, they were forced to retreat to several mountaintop strongholds in northern Iran and along the northern coast of Syria, where they carved out small independent principalities.

One of the Iranian fortresses, Alamut, which Hassan-i Sabbah had already conquered in 1090, became a central base in which he subjected his followers to a rigorous course of military and religious training that stressed discipline and absolute obedience. In order to threaten those who opposed this small sect and to curry favor with local rulers, these Ismaili Shia started carrying out political assassinations in very public places. When sent out on a mission, members usually traveled in groups of two or three and attempted to blend in with the local environment. After

➤ THE OLD MAN OF THE MOUNTAIN

Rashid al-Din Sinan (ca. 1133–ca. 1193), often referred to as the “Old Man of the Mountain,” was a grand master of the Order of Assassins who took over the organization in 1164 and established a base of operations at the fortress of Masyaf in the mountainous coastal region of northwestern Syria.

Under his leadership, the Assassins twice attempted to murder Salah al-Din (Saladin) but failed. Shortly after Sinan's death, the Assassins made an alliance with the Frankish crusader Count Henry of Champagne. According to an unreliable thirteenth-century source, in order to impress Henry with the loyalty and discipline of his followers, his successor, also known as the Old Man of the Mountain (as were all subsequent grand masters of the Syrian branch), ordered two Assassins to jump to their deaths from the fortress walls, which they did without hesitation. Although the story was repeated in various forms in Europe and elsewhere for generations, there is no trustworthy evidence this death leap ever occurred.

—April L. Najjaj

studying their victim, they usually struck during a moment of weakness, such as when the man emerged from a mosque after Friday prayers or walked in the street during daylight hours. The unswerving loyalty and almost certain deaths of those who committed these murders led opponents to believe that they could have carried out such missions only if they were taking drugs. A well-known narcotic in the Arab world is hashish, and consequently these men were referred to in Arabic as *hashishin* (takers of hashish), hence the origin of the word “assassin.” There is, however, no credible evidence that they conducted their assassinations under the influence of this or any other drug.

Although Shia in origin, the Assassins showed no religious loyalty outside their own sect and carried out attacks against Christians and Sunni and Shia Muslims alike. Their more famous victims included two governors of Mosul, the Turkish *atabeg* (deputized guardian of a young Seljuk prince) Mawdud in 1113, and Aksungur al-Bursuqi in 1126. The Assassins twice attempted to kill Salah al-Din (Saladin), in 1175 and 1176, but were

unsuccessful. On the Christian side, the Assassins were responsible for the murder of Conrad of Montferrat in 1192, a crusader who laid claim to the throne of the Latin kingdom of Jerusalem.

With increasing political instability in the region around the mid-thirteenth century, most Assassin fortresses were captured and the residents killed by Mongols and Mamluks alike. By the 1270s the Assassins had ceased to be a significant political force. There is little known today about the original beliefs of the Assassins because their library was destroyed in 1256 with the Mongol conquest of Alamut. However, the group continued a tenuous existence in Iran, where they came to emphasize spiritual means for achieving their goals as opposed to violent political action. Eventually, they fled during unrest with the Qajar dynasty (1794–1925) and established a community in Bombay (Mumbai), India, in 1845 under the rule of Aga Khan I, Hasan Ali Shah, considered a direct successor to Hasan-i Sabbah. The group continues today as a scholarly and philanthropic organization that works to preserve Islamic heritage throughout the world.

Almoravids

One way to identify the Almoravids is to describe them as the enemy of the legendary Spanish hero El Cid (ca. 1043–1099). Indeed, they fought against El Cid numerous times and lost, but this does scant justice to the Almoravids. Originally, they were Berber nomads from the western Sahara who emerged in the mid-eleventh century to build one of the richest, most powerful empires in western Islam. The dynasty was born among the Saharan Sanhaja, a confederation of some 70 tribes. These tribes lived close to nature, earning their living by raising camels, sheep, and goats and by giving safe passage to

caravans that passed through their desert land. They were steadfast in their effort to survive in this harsh environment and were hardy warriors, swift, mobile, and brave in the face of adversity. They also demonstrated a sense of moral righteousness that took the form of loyalty toward the tribe and confederation.

The Saharan Sanhaja became Muslim sometime during the tenth century as Muslim merchants and missionaries passed through their land. They became Almoravids when one of their tribal chiefs returned home from pilgrimage to Mecca and brought a fiery preacher to teach them, a scholar from a school in southwestern Morocco called Dar al-Murabitin (the house of those who are bound together in truth); “Almoravid” is an Anglicization of al-Murabitin. That teacher, Abd Allah ibn Yassin, taught a version of Sunni Islam that was fundamentalist, at least in the sense that it was based on strict, literal interpretation of scripture. It was puritanical and reformist in that it rejected alcohol, music, womanizing, or compromise of any type with the infidel (broadly defined to include deviant Muslims). When the preacher offered his religious endorsement to a specific candidate as the new chief for the confederation and won a party of tribesmen over to his version of Islam, religious ideology became the force that now drove the Almoravids, and it became a drive to victory against all odds.

The mission of the new religious movement was jihad. Initially jihad was understood as a struggle to attain and uphold a “true” understanding of Islam. Eventually, however, it evolved into “holy war.” First, it involved fighting against non-Muslim desert tribesmen, nonbelievers who obstructed the spread of this puritanical, reformist Islam in the western Sahara. Next it meant defeating the regimes of “bad” Muslims in North Africa and imposing Almoravid royal authority over them, as they did in Sijilmasa. Finally, jihad brought the Almoravids to Iberia to wage war against Christian infidels who were advancing against Islam.

When the people of Sijilmasa in southern Morocco petitioned the Almoravids in 1054–1055 to rescue them from their tyrannical rulers of the Bani Wanudin tribe, the Almoravids obliged. They expelled the Bani Wanudin and moved into the garrison themselves. The following year, the

➤ ARCHAEOLOGY AND THE ALMORAVIDS IN SIJILMASA

Chroniclers tell us that soon after the Almoravids took Sijilmasa, they banned non-Quranic taxes, smashed musical instruments, and destroyed shops where wine was sold. There is definitive and dramatic archaeological evidence of their puritanical, prohibitionist policy. Analysis of archaeobotanical specimens shows that early in Sijilmasa's history, grapes were among the most abundant crop in the surrounding region. But from the middle of the eleventh century to the middle of the thirteenth century, which corresponds exactly to the reign of the Almoravids and the equally puritanical Almohads, grapes are almost totally absent from the archaeological record.

Archaeology also reveals that the *dar al-imara* (house of government) was transferred from its original location to, archaeologists think, the high plateau on the northern edge of the site, where they enclosed it within a citadel that was itself within the larger circuit walls of the city. As foreigners themselves, the Almoravids evidently felt the need

to protect themselves from Sijilmasians as well as from an outside enemy.

The end of Almoravid rule in Sijilmasa is even more dramatically portrayed in the archaeological record than is their arrival. It is well known that when the Almohads took control of distinctly Almoravid mosques, they altered them to suit their more austere aesthetics and changed the orientation of the *mihrab* (the interior niche that indicates the direction of Mecca). Within the Almoravid mosque of Ibn Abd al-Malik in Sijilmasa, archaeologists found fragments of carved stucco covered with a layer of smooth plaster to camouflage the intricate carving, a decoration such as is seen at the Almoravid Qarawayin Mosque in Fez. Also, the Almohad extension of the mosque shifts three degrees farther to the south, as is also seen in the Almohads' Kutubiya Mosque in Marrakech. Both of these renovations occurred in the mid-twelfth century, exactly the time of the Almohad conquest.

—Ronald Messier

Almoravids conquered Audaghust on the southern edge of the desert. It, like Sijilmasa, was a city on the edge of the great desert "sea." Both cities were key to the gold trade from West Africa to the Mediterranean, which provided the Almoravids with the wealth they needed to build an empire.

It took the Almoravids another 20 years to conquer the rest of Morocco and western Algeria. The Almoravids established Aghmat as their principal residence and capital city for the next 13 years. The Almoravid emir Abu Bakr (d. 1087) married a local princess in Aghmat, Zainab al-Nafzawiya, a woman who became legendary for her beauty, energy, intelligence, and political savoir faire. Legend has it that when suitors called, she said that "nobody shall marry me but the one who rules the whole Maghrib [western North Africa]." Abu Bakr divorced her when a rebellion broke out in the Sahara, requiring him to return. So, she married Abu Bakr's cousin, Yusuf Ibn Tashfin (1009/1010–1106), whom Abu Bakr had appointed to rule in his stead in the Maghrib. Zainab became his confidant and political advisor, and she placed her immense for-

tune at his disposal. Yusuf went on to conquer the whole of the Maghrib. In deference to the emir who returned to the Sahara, Yusuf struck coins in Abu Bakr's name until the latter was killed, according to legend, by a blind bowman.

Soon after the Almoravids arrived in Aghmat, the sheikhs (leaders) of the Wurika and Haylana, two local Berber tribes, complained that the city "became overcrowded and people were oppressed there." A more likely scenario is that the Almoravids felt uncomfortable in the foothills of the High Atlas mountains where their opponents resided. The Almoravids were desert people, not used to fighting in the mountains. So they moved 18 miles (30 kilometers) away across flat plains to build a new capital city from scratch, the city of Marrakech, in 1070–1071.

Across the Strait of Gibraltar, the Muslim city of Toledo fell to the Christian king Alfonso VI of Castile-León (r. 1065–1109) in 1085. The Christian Reconquista of Iberia had now begun in earnest. The weak and divided Muslim kings of southern Spain felt that they had no choice but to invite the Almoravids to their shores to defend them. The Almoravids stopped the Christian

advance in 1086 and again in 1089 and ostensibly rescued these so-called *taifa* (factional) kings, but by 1094 they had made Al-Andalus (the Arabic name for Muslim-dominated Spain) part of their empire. Almoravid southern Spain, today known as Andalusia (from *al-Andalus*, the Arabic name for Muslim-dominated Spain), was a wealthy land whose riches were based on the introduction of new crops and agricultural technology. Moreover, it was a producer of fine industrial goods and the western end of the east-west axis of trans-Mediterranean trade, making it a considerable prize for a dynasty from the western Sahara. For the first time since Roman antiquity, southern Iberia and the Maghrib were under the same regime.

The Almoravids brought political stability and economic prosperity to both, although some say that the Almoravids killed “high culture” in Andalusia. To the extent that Andalusian high culture resulted from the interaction of Muslim, Jewish, and Christian minds, perhaps they did; the latter two communities had less freedom under the Almoravids. A number of Muslim poets fled Andalusia and went to the Maghrib as unhappy, exiled political opponents of the Andalusian *fugaba* (Islamic legists). But the very fact that these poets could go to the Maghrib and continue writing suggests that the Almoravid hierarchy at the very top was anything but anti-intellectual. Indeed, they were also patrons of Andalusian artists and poets, whom they brought home to adorn the courts of North Africa. To that extent, they fostered a degree of cultural unity between the Maghrib and Andalusia that was unprecedented since the passing of the Roman empire in the West.

In the end, holding on to Andalusia cost more than the Almoravids could afford. Their credibility depended on sustaining a jihad against the enemy. It also depended on upholding their policy of no non-Quranic taxes. But they simply could not finance a two-front war (the second front being Morocco itself) without raising taxes. Moreover, their reformist ideology was challenged by another Islamic reformer, in another tribal confederation, trying to establish a new dynasty buttressed by a new religious ideology. Its adherents were called al-Muwahiddin, or Almohads, “those who profess the oneness of God.”

The theology of the new regime condemned the Almoravids as polytheists, claiming that their scriptural literalism made a god out of scripture. On a popular level, they promised little that differed from the Almoravids: suppression of wine, women, and song and no non-Quranic taxes. The vitality of the new regime held promise for the masses, who were disappointed that all of their expectations of the Almoravids had not been fulfilled.

The end came quickly for the Almoravids. Ali Ibn Yusuf, who succeeded his father in 1106, died in 1144. Revolt broke out again in Cordoba that year, and most of Andalusia recognized the authority of the Almohads. In the Maghrib, in 1145, Ali's son Tashfin lost his life trying, unsuccessfully, to defend the city of Oran. Fez was the next to fall, and within weeks several other cities in the Maghrib fell. Ceuta sent a delegation to the Almohads seeking protection. Meknes and Salé surrendered without resistance; Marrakech, the capital, was the last to fall in March 1147.

The Fatimid Caliphate from Glory to Dissolution

The Fatimid caliphate of North Africa and Egypt (909–1171) rose up as one of the most serious threats to the Abbasid caliphate in Baghdad. It took its name from its founder Ubayd Allah, a religious refugee who fled the Islamic heartland in the Middle East like so many others in the early tenth century due to Sunni persecution. A Shia Muslim, he claimed the messianic title of al-Mahdi (the Guided One), the long-promised deliverer of Islam, and justified that as well as the title of caliph, or deputy of the Prophet, by claiming descent from the Prophet Muhammad through his daughter Fatima and her husband Ali.

Ubayd Allah established his caliphate in 909 in Ifriqiya, present-day Tunisia, replacing the rule of the Aghlabids in Ifriqiya as well as in Sicily. He built a new city there to serve as a port for Qayrawan, the hitherto religious and political capital of Ifriqiya 90 miles (145 kilometers) inland from the coast; al-Mahdi called the new city al-Mahdia. It seems clear that Ifriqiya was from the start a base to build up resources for further imperial expansion. He and his successors sent out agents east and west to assess their options. As a result of this intelligence, the Fatimids conducted no fewer than five temporarily successful expeditions to conquer Sijilmasa in the west in order to control the gold routes to the western Sudan and launched three early campaigns to conquer Egypt to their east. On their fourth attempt they succeeded in 969.

The conquering hero was Jawhar al-Siqili (the Sicilian), who established Fatimid headquarters immediately north of the Egyptian capital of Fustat and called it al-Qahira (Cairo, "the city of victory"). He built an imperial palace and the al-

Fatimid fresco of a seated man holding a cup, tenth–eleventh century. (The Art Archive/Corbis)

Azhar (brilliant) Mosque, which would play a major role in the teaching of Islamic law. The mosque eventually became a major center of learning and an instrument of the state to propagate Shia theology in a land that heretofore had been solidly Sunni. The Fatimid caliph al-Muiz (r. 953–975) moved east to Cairo four years later in 973.

The Fatimids peaked early in Egypt. The caliph al-Aziz (r. 975–996) focused with great success on imperial administration, which launched a period of relative peace and prosperity. What has survived of Fatimid material culture is testimony to a rich and sumptuous life, at least for the rulers: palaces decorated with exotic woods from Africa that were sculpted and often painted and inlaid with ivory, creating abstract geometric design or Arabic script in *kufic* (stylized, angular) design. The elite wore clothing of silk, wool, and embroidered cotton, and they also wore jewelry such as necklaces, bracelets, rings, and earrings of gold encrusted with pearls, glass beads, and semiprecious stones. They ate their meals on beautiful ceramic lusterware and glassware that

➤ AL-HAKIM—A MAD CALIPH?

The reign of Caliph al-Hakim (r. 996–1021) was a curious one. At first, he was meticulous about his duties as ruler and worked to increase the empire's prosperity, as al-Aziz had done. Al-Hakim brought in famous scholars, such as the physicist Hassan ibn al-Haytham whose seven books on optics (*Kitab al-Manazir*) were translated into Latin in the late twelfth century. Manuscripts of it made their way to Oxford University, where they had a profound impact on the study of optics there in the late thirteenth century. The *Kitab al-Manazir* later deeply influenced Johannes Kepler (1571–1630), who produced his own work on optics shortly after a translation of it was printed in Europe. But when al-Haytham's theoretical calculations failed to regulate the Nile floods, the scientist was forced to hide from the caliph's wrath for the rest of his life.

Had the caliph gone mad? His defenders say that he was trying to restore the laws of Islam, which he felt had been allowed to lapse. His reformist ideology forbade wine, women, and song. He prohibited the cultivation of grapes and destroyed vineyards. Banquets and music were

banned. Eventually even walking along the Nile was prohibited. Women were generally forbidden to leave the house; thus, penalties were imposed on the finishing of women's shoes. Generally, Fatimid rulers were very tolerant toward the *dhimmis*, namely Christians and Jews who were given protected legal status. But al-Hakim enforced restrictions that earlier were only theoretical. *Dhimmis* were forced to wear distinctive clothing, including an iron cross on the neck for Christians and a yoke with bell for Jews. Numerous churches and synagogues were destroyed, including the Church of the Holy Sepulcher in Jerusalem. Today in Cairo, Shia Muslims continue to venerate the memory of al-Hakim. After the caliph's death, a new sect broke off from Islam under its leader Muhammad ibn Ismail al-Darazi. What is distinctive about the sect, beyond a mystical pantheism, is continued worship of al-Hakim as an incarnation of God. Today the sect, which largely survives in the highlands of Lebanon, Syria, and Israel, is known as the *Druze*.

—Ronald Messier

Fatimid artisans made better than any other or on blue and white porcelain imported from China. The wealth of Fatimid Egypt was based on abundant agriculture, which had become legendary in Egypt; on the production of skilled craftsmen; on long-distance trade; and on taxes assessed on all of this. Dinars (gold coins) struck in Fatimid mints had a degree of fineness, higher than any other coinage on the market, and for the first 100 years of Fatimid rule enjoyed the reputation of being the dollar of the Mediterranean.

Imperialist expansion continued to be a hallmark of the Fatimids. The coastal corridor connecting Egypt to Palestine and Syria that saw so many armies pass since early antiquity now invited the Fatimid armies of Caliph al-Aziz. As a result, the Fatimids took Jerusalem in 969, Tripoli (in what is today Lebanon) by 975–976, and Damascus in Syria in 978. Aleppo in Syria proved too resistant until the reign of al-Hakim (r. 996–1021) and fell in 1015. Fatimid armies moved also into the Hejaz, or western regions of the Arabian Peninsula, in 970–971, occupying the holy cities

of Mecca and Medina, which they held until the reign of al-Mustansir (r. 1036–1094). But as the Fatimids gained ground in the east, they lost it in the west.

The Fatimids began to lose their grip on their empire in the second half of the reign of al-Mustansir, gradually losing control of Ifriqiya and Sicily by the middle of the eleventh century. In spite of the leadership of the vizier Badr al-Jamali, they were unable to prevent the Seljuk Turks from taking Syria. The Seljuks took Jerusalem in 1071 and Damascus in 1076. The Seljuks had declared themselves defenders of Sunni Islam and as such were bitter enemies of the Fatimids. Warfare between them was so intense that just before they lost Jerusalem to the Seljuks, the Fatimids had forbidden Christian pilgrims from coming to the Holy Land. This was not an anti-Christian policy; rather, it was simply too dangerous; they could not protect people traveling through this war-torn region, from which large numbers of pilgrims failed to return home safely. Word of this unrest and lack of security in the

Holy Land fueled rumors in the West that Eastern Christians were suffering at the hands of Muslims and provided one of the rationales behind the launching of the First Crusade in 1095–1096.

The Fatimids retook Jerusalem in 1098 but lost it again the very next year to a new enemy, the Christian crusaders. In the grand scheme of things, the crusaders were but another foe, but they contributed significantly to increasing instability and the gradual decline of the dynasty. The able vizier Badr al-Jamali was succeeded in that position by his son al-Malik al-Afdal, who appointed and controlled the next caliph, al-Mustalli (r. 1094–1101). This caused a split among the Fatimids. A splinter group under the missionary Hassan al-Sabbah supported Nizar, a different son of al-Mustansir. This movement became known as the Nizaris, better known as the Assassins.

Badr al-Jamali also appointed the next caliph, al-Amir (r. 1102–1130). But al-Amir was resentful of the vizier's guardianship and had him killed in 1121. In the end, it was the Seljuks who terminated the Fatimid caliphate. The last of the Fatimid caliphs, al-Adid (r. 1160–1171), was forced to appoint as his vizier Shirkuh, a Kurdish general in the employ of the Seljuk ruler of Syria, Nur ad-Din. It was Shirkuh's nephew, the famous Salah al-Din ibn al-Ayyub (Saladin), who overthrew the dynasty in 1171 and established his own Ayyubid dynasty to rule Egypt and Syria.

The Ayyubids of Egypt and Syria

The political position of Egypt prior to the arrival of Salah al-Din b. Ayyub (Saladin, r. 1137/1138–1193) was tenuous. Ruled from Cairo by an Ismaili Fatimid dynasty (910–1171) that was increasingly ineffective, Egypt appeared to be a ripe prize for the crusader kingdom of Jerusalem poised just to its north. When the Fatimids repudiated agreements to pay the Franks tribute and launched campaigns to disrupt Frankish trade, King Baldwin III of Jerusalem (r. 1143–1163) raided and captured the key Levantine port city of Ascalon in 1153. This setback caused massive political upheavals in Egypt as people scrambled for power, leading ultimately to the assassinations of the first minister and the Fatimid caliph.

Out of this political instability emerged Saladin. Using the political turbulence as a pretext to enter Egyptian affairs, the Turkish *atabeg* (governor) of Syria, Nur al-Din Zangi (r. 1146–1174), put forward Saladin, a Sunni Kurd from Tikrit. Initially, Saladin came to Egypt as an aide-de-camp to his uncle, the Zangid-appointed governor Shirkuh (d. 1169), but with his uncle's untimely death in 1169, Saladin's position became insecure. As a Sunni, his allegiance lay with the Abbasid caliph in Baghdad, yet he was able to become the chief minister of the Shia Ismaili caliph. Also, although Saladin was the leader of Nur al-Din's forces in Egypt, they were few in number in comparison with the size of the Fatimid army, and Saladin had no real authority over these latter forces.

When the sickly Fatimid caliph al-Adid (r. 1160–1171) fell ill prior to his twentieth birthday in 1171, Saladin initiated plans to take Egypt for himself. The Friday sermon, long a sign of political legitimacy, was given in the name of the Sunni Abbasid caliph al-Mustadi (1170–80), the first time in 200 years that a Sunni caliph was so honored in Egypt. The death a few weeks later of the young Fatimid ruler had three important consequences. First, it sounded the death knell for the Shia Fatimid dynasty in Egypt. Second, it marked the formal return of Egypt back to Sunni Islam. Third, it inaugurated the rise of the Ayyubid dynasty (1171–1250), which received its name from Saladin's father, Ayyub, and would rule Egypt and Syria for almost 80 years.

➤ SULTAN AL-KAMIL—THE CONSUMMATE DIPLOMAT

Born in 1180, Nasir al-Din al-Malik al-Kamil came to the aid of his father al-Adil in 1199 during the power struggles that followed Saladin's death. For his help, al-Kamil was made viceroy of Egypt for the duration of his father's reign. After the death of al-Adil in August 1218, the situation again deteriorated. Crusaders had already invaded coastal Egypt in May 1218 as part of the Fifth Crusade (1217–1221), and various Ayyubid princes made bids to assume power over Egypt and Syria. In November 1219 the key port city of Damietta fell to the crusaders. However, the crusaders failed to press their advantage and were defeated in the Nile Delta in 1221. In victory, al-Kamil, who always seemed to prefer diplomacy to battle, showed mercy, allowing the crusaders to negotiate a safe departure from Egypt in return for Damietta.

Victory, however, brought little respite. Domestic strife threatened to split the territory, with al-Muazzam (d. 1227) gaining Syria and al-Kamil retaining Trans-Jordan (present-day Jordan). The death of al-Muazzam shortly thereafter created an opportunity for al-Kamil to restore Saladin's entire patrimony, but at that moment the crusaders, under the command of the Western emperor Frederick II (r. 1212–1250), chose to make yet another bid for Egypt with the Sixth Crusade (1227–1229). Now caught in a siege of Damascus with the crusaders to his back, al-Kamil sought first to delay and then to negotiate and eventually reached an agreement with Frederick II. The price was Jerusalem, which the sultan handed over in the Treaty of Jaffa of 1229, but the sacred prize was hardly worth it. Jerusalem was indefensible, its walls having been destroyed in 1219. Moreover, the treaty guaranteed Islamic control of the Temple Mount and the free exercise of their religion and law for all Muslims residing in the city. The treaty was disliked by Muslims and Christians alike, but in the end it proved to be another diplomatic victory for al-Kamil. Emperor Frederick II had been neutralized, and the Christian gains were ephemeral. Jerusalem was reconquered by the Muslim lord of Transjordan in 1239, lost in 1241 but recovered for Islam in 1244. It remained in Muslim hands until 1917.

Among the Coptic Christians of Egypt today, al-Kamil is still honored and remembered as a fair and just ruler.

—*Rasheed Hosein*

The Ayyubid period can roughly be divided into three distinct phases: the period of Saladin himself (1171–1193), the period of consolidation up to the death of Sultan al-Kamil (r. 1218–1238), and finally a rapid decline, which ended with the removal of the dynasty in 1250.

Saladin's career presents many challenges to modern historians. It seems that he spent most of his first 15 years solidifying his position against his coreligionists rather than concentrating his attacks on the Franks. Only the death of his nominal overlord Nur al-Din in 1174 prevented the two from fighting each other. In a series of political maneuvers, Saladin was able to have the caliph al-Mustadi invest him formally with Egypt, Yemen, parts of Syria, and all the lands he could reconquer. Saladin was also able to eventually claim the guardianship of Nur al-Din's successor al-Salah Ismail (1163–1181), who was then only a teenager.

Once Saladin was able to solidify his power, he finally engaged in battle with the Franks with extreme efficiency, inflicting upon them a catastrophic defeat at the Battle of Hattin on July 4, 1187. The way to Jerusalem now lay open, and after a brief siege the city surrendered to Saladin on October 2, 1187. Unlike the conquest by the crusaders 88 years prior, Saladin did not perpetrate a horrific bloodbath on the city. He continued to push his advantage, and at the height of his conquests the Franks were reduced to a thin coastal area around the cities of Antioch, Tripoli, and Tyre. However, the armies of the Third Crusade (1188–1192) managed to regain Acre, Jaffa, and other key coastal areas, thereby stabilizing the situation for the crusader states. Notwithstanding, at his death in 1193 Saladin was Islam's most successful jihadist against the Western crusaders.

The period of Ayyubid consolidation is marked by the careers of two key figures: Saladin's brother al-Adil Sayf al-Din (r. 1193–1218) and the latter's son al-Kamil (r. 1218–1238). Sayf al-Din, known as Safadin to the crusaders, was largely able to prevent the disintegration of Saladin's patrimony by installing his many sons in key positions. However, their allegiance did not extend to Safadin's chosen successor al-Kamil. A consummate political strategist, al-Kamil went to the crusaders for aid. The price, however, was

steep. Jerusalem was ceded back to the crusaders, but the Islamic religious heart of the city remained, with its Muslim inhabitants. While neither side was thrilled with the Treaty of Jaffa (1229), the nature of the Ayyubid polity necessitated such compromise, and al-Kamil emerged as the undisputed Ayyubid ruler.

Unlike the crusaders, primogeniture inheritance was not practiced by the heirs of Saladin. Rather, they followed the notion of corporate sovereignty, which held that each member of the ruling family had an equal share of property and the dignity of rule. As a result, there were soon many Ayyubid princes commanding estates and territories of various sizes. Both Safadin and al-Kamil were able to command the loyalty of these “lesser” Ayyubids by force and fiat, but they were the high-water mark of the later Ayyubids. With the death in 1249 of al-Salih Ayyub, al-Kamil’s son and the last great Ayyubid, a period of rapid collapse followed, leading to the usurpation of Egypt and Syria by the Mamluk dynasty (1250–1517) within the year.

Mongols and Muslims—The Mongol Impact on Dar al-Islam

Medieval Muslims viewed the world as divided into two parts. The area ruled by Muslims was known as *Dar al-Islam*, the Abode of Islam, or Submission (to God), whereas areas dominated by nonbelievers were known collectively as *Dar al-Harb*, the Abode of War, or Confusion. Theoretically, a permanent war existed between these two abodes, or houses, until ultimately Dar al-Islam would prevail and the whole world would know God’s peace. In the thirteenth century,

however, a major portion of Dar al-Islam suddenly became Dar al-Harb.

In 1219 Mongols under Chinggis Khan (1165–1227) began their invasion of the Islamic world. The invasion began in the Khwarazmian empire (present-day Afghanistan, Uzbekistan, Turkmenistan, and much of Iran and Pakistan) when a Mongol-sponsored caravan was massacred there. In retaliation, the Mongols quickly overwhelmed this Muslim state, sending it into anarchy. The Mongol conquests of the Middle East continued in the 1230s when another Mongol army conquered Iran, Transcaucasia, and much of Afghanistan. In the 1240s the Mongols extended their control over the Seljuk sultanate of Rum, comprising much of present-day Turkey.

During their conquests, the Mongols destroyed any opponent who defied them but generally allowed all religions to be practiced without discrimination and exempted clerics and religious institutions from taxes. Indeed, this level of religious toleration was one of the hallmarks of the Mongol empire that set it apart from most of its contemporary societies. The Mongols did this not out of humanitarian reasons but rather as a form of celestial insurance so as not to offend any god and to avoid religious clashes that might cause instability in their empire.

Nonetheless, much of eastern Dar al-Islam was now transformed into Dar al-Harb. In the midst of these invasions, particularly the early ones, Muslims viewed the Mongols as a punishment from God for their sins, a view shared by Christians when the Mongols invaded Eastern Europe. It was a terrifying time for many, and streams of Muslim refugees flowed into the unconquered regions of Dar al-Islam.

Between 1250 and 1260 three clashes occurred that drastically altered Dar al-Islam. In 1250 Mongke Khan, the fourth ruler of the Mongol empire, sent his brother Hulegu to finish the conquest of Southwest Asia. His first target in 1256 was the Nizari Ismailis, or so-called Assassins, of northern Iran, members of a minority form of Shia Islam. Having maintained their position of independence since the late eleventh century through the use of disguised assassins and terror, the Nizari Ismailis’ destruction was

➤ MONGOL CONVERSIONS TO ISLAM

Although the Mongols began their empire with a policy of religious tolerance, it weakened over time as the Mongols converted to the religions of most of their subjects. Initially most of the Mongols were shamanistic, a religious system in which the spirit world interacts with the everyday world in beneficial and harmful ways and in which certain spirit-possessed persons, known as shamans, act as intermediaries between the two spheres of existence. Typically, shamanistic peoples lack a canon of doctrinal beliefs, or a formal faith. Consequently, they convert relatively easily to more complex world religions such as Islam, Buddhism, and Christianity due to the appealing moral aspects of these religions, the certitude they offer in the form of a defined creed of faith, and the sense of equality that is inherent within each.

The first Mongol to definitively convert to Islam was Berke, son of Chinggis Khan's eldest son, Jochi. There are variant accounts that date his conversion, ranging from his birth to his young manhood, but all affirm that it was a sincere conversion and was guided by a Sufi mystic. Most Mongols in the western portion of the empire converted to Islam while under the guidance of Sufis.

Sufis, who generally sought a more personal relationship with God, were often frowned upon by both Sunni and Shia Muslims, depending on time and location. Nonetheless, Sufism was instrumental in spreading Islam among the Mongols, as well as into India, Africa, and Southeast Asia. While it is often thought that the Sufis' success in converting the Mongols was because they often resembled shamans, their success hinged on their syncretic views, which allowed the Mongols to incorporate many of their older traditions into their new religion. Thus, they did not completely abandon their traditional ways. Sunni religious scholars, however, still often viewed them as infidels.

—*Timothy May*

generally viewed by Sunni Muslims as a welcome achievement.

The second event was the destruction of the Abbasid caliphate in February 1258. The Abbasids had endured since 750 and had transformed Baghdad into the religious and cultural center of the Islamic world, but the Mongol destruction

of Baghdad and execution of the caliph, who claimed to be the deputy of the Prophet and the Shadow of God on Earth, changed this forever. Although Baghdad gradually recovered, it never regained the religious importance it once held in the Islamic world. Although the Mamluk sultan of Egypt set up an Abbasid refugee as caliph in Cairo in 1261 and this line of puppet Abbasids-in-exile continued to proclaim its legitimacy into the sixteenth century, in reality the Abbasid caliphate ended in 1258, and the office of caliph had become an empty honor.

The final event occurred in September 1260 at the Battle of Ayn Jalut in present-day northern Israel, when the Mamluks of Egypt turned back a Mongol advance that aimed to drive all the way to Egypt. The Mongols had already conquered Syria but were subsequently forced out by the Mamluks of Egypt. This victory at Ayn Jalut, in the eyes of many, made these same Mamluks, Turkish professional soldiers who had seized power in Egypt in 1250, the new defenders of Islam, a position they claimed until their own conquest in 1517 by the Ottoman Turks, another champion of Islam. Afterward the Mongol empire divided into four warring states. One of them, the Jochid Ulus, popularly known as the Golden Horde, became an ally of the Mamluk sultanate. Its ruler, Berke, had converted to Islam in his childhood and used the destruction of the Abbasid caliphate as his rationale for a war with Hulegu's domain of the il-khanate of Persia. This war lasted basically until the demise of the Il-Khanids in 1335 even though Il-Khan Ghazan embraced Islam in 1295.

The Mongol impact on Dar al-Islam was immense. While their invasions drastically altered its political and social structure, they also caused a shift in populations. The ramifications were numerous, but three had great significance. Among those who fled west into present-day Asian Turkey was a group of Turks who took advantage of the power vacuum after the fall of the il-khanate to establish the Ottoman empire. The Ottomans would soon become a new driving force in Islam.

Second, the Mongols were at least partially responsible for some major shifts in the makeup of the Islamic world. The Sufi, or mystical, variant of Islam received great support throughout the western portions of the Mongol empire, in-

cluding the il-khanate of Persia, the Golden Horde of the Volga, and the Chaghatayid khanate centered in Central Asia. Indeed, by the fourteenth century most of the Mongols in western and central Eurasia had converted to Islam (but not in Mongolia, where they became Tantric Buddhists). Thus, once again Dar al-Harb receded, and Dar al-Islam now expanded into portions of Eurasia where it previously never had any roots. Moreover, one Sufi leader, Saif al-Din of the Safavi Sufis in Azerbaijan, received immense patronage from the il-khans. Gradually his followers became militant Shia Muslims who established the Safavid empire of Iran and imposed Shia Islam as its state religion, thus transforming Iran from a Sunni-dominated region into a Shia-dominated region.

Third, with the destruction of Baghdad and the rise of the Mamluks in Egypt and later in Syria, Cairo became the religious and cultural center of Islam. Viewed as the defenders of Islam, including the holy cities of Mecca and Medina, the Mamluks spent considerable wealth to reinforce this image by supporting religious scholars, building mosques, and endowing other institutions. In many ways, Cairo remains the cultural center of Dar al-Islam today and the seat of the most prestigious Islamic center of learning, Al-Azhar, which received considerable support from the Mamluks.

Rebuilding Baghdad, 1258–1335

Muslims in the Middle East saw the Mongol invasions as an unprecedented catastrophe that reached its height in the conquest of Baghdad and the extermination of the last Abbasid caliph, al-Mustasim, in 1258, and all of it was accompa-

nied by pitiless cruelty with calamitous results: death, destruction, depopulation of cities, deportations, enslavement, and migrations. Also, the arrival of Mongols and numerous Turks led to an increased nomadization and a significant decline in agricultural production. How many people died during the conquest of Baghdad remains unclear. Estimates vary from 200,000 to 2 million. A large part of the city was destroyed, including the caliphal tombs, the caliph's mosque, the holy tombs of Shia imams, and the grand library, which contained innumerable valuable books and manuscripts. Hardship and difficult living circumstances following the invasion, as well as natural catastrophes, and epidemics influenced the perspective on life of inhabitants in the region. They provoked apocalyptic visions and promoted the spread of the belief in miracles and a saint-cult among the Baghdad population. The number of presumed saints and the reports of supernatural apparitions grew considerably during the latter half of the thirteenth century.

The feeling of doom described in the sources, however intense it may have been, is moderated by accounts of immediate reconstruction and reorganization. Before the Mongol commander Hulegu continued his conquests farther west, he confirmed both the *wazir* (prime minister) and the chief financial officer and appointed the head of religious endowments and directed him to commence the reconstruction of the city as soon as possible. Hulegu also ordered that the bazaars be reopened and that the Baghdad mint continue its production. In addition, he confirmed Islamic law by immediately naming judges, although he was rather religiously tolerant and did not grant Islam any dominant position. Furthermore, the family of the caliph was not systematically destroyed. Some of his successors survived and later became highly respected personalities in the city; however, they remained excluded from any important public office. The female members of the caliph's family were popular marriage partners, indicating their high social reputation. Through the adoption of the existing structures and the reinstatement of former officials, Mongol rule guaranteed a certain sense of continuity in the city.

Ala ad-Din Juwayni was appointed governor of Iraq in 1260, and the fact that he served in

► THE ABBASID CALIPH OF BAGHDAD— HOLY IMAM OF SUNNI ISLAM

Since its foundation under the second Abbasid caliph al-Mansur in 762, Baghdad had been the capital Abbasid city, seat of the caliph, and the cultural, religious, and economic center of the Islamic world. However, since the middle of the twelfth century, the caliphate had been in a process of decline and had already lost most of its political sovereignty and power to Seljuk Turkish sultans. Nevertheless, the role of the caliphate as imamate, or chief religious authority, still symbolized the only legitimate Islamic rule for Sunni Muslims. When the caliph's ambassadors were trying to dissuade the Mongol commander Hulegu from attacking Baghdad, they are reported to have said, "If the caliph is killed, the whole world will be disorganized, the sun will hide its face, the rain will cease to fall, and the plants will no longer grow." The Mongols, who had some ideas concerning the sanctity of sovereignty, seem to have believed the ambassadors. They feared that if they killed the caliph with a sword and his blood was spilled on the ground, there would be an earthquake. Therefore, Hulegu had him rolled up in a carpet and trampled to death without shedding any blood. Despite the violent death of Caliph al-Mustasim in 1258, the sun reemerged and rain continued to fall, but the Mongol il-khans did not revive the Abbasid caliphate. Even the Mamluk sultans of Egypt and Syria, who installed a surviving Abbasid prince as caliph in Cairo in 1261, could not resuscitate the Abbasid caliphate's religious authority over all of Sunni Islam; these so-called caliphs remained merely puppets in office until 1517.

—Hend Gilli-Elewy

office for more than 20 years signaled an effort to create continuity in Baghdadi life after the break induced by the Mongol conquest. He ameliorated the situations of the province and the city as well as of peasant life, and it is fair to say that he made the province more prosperous than it had been under the last caliphs. He especially distinguished himself by his active interest in construction and public projects.

Once the il-khanate of Persia converted to Islam under Ghazan Khan (r. 1295–1304), Baghdad regained some of its symbolic significance as the

center of Sunni Islam, and Islam again became the official religion of Iraq and Iran. Ghazan Khan's extensive reforms were aimed at Islamizing the Mongol administration and at physical reconstruction and the revival of city life, infrastructure, and agriculture. The il-khan visited Iraq several times and embarked on an active cultural policy in support of Islam. Shia holy sites in Baghdad, Najaf, and Hilla were also visited by Mongol pilgrims and benefited from new endowments and construction projects. Iraqi Shia shrines enjoyed even more attention when the last il-khan, Abu Said, converted to the Shia branch of Islam. After his death in 1335, the il-khanate collapsed, and Iraq regained some of its territorial unity independent of Iran. Baghdad reemerged as a local center of Iraq and reverted back to some of the pre-Mongol political structures until the end of the century, when Baghdad was struck again by a new wave of conquests from Central Asia, this time under the Turkish conqueror Timur-i Leng (Tamerlane) in 1393 and 1401.

The Mamluk Sultanate, 1250–1517

The final dissolution of Saladin's patrimony was accomplished in a relatively short period of time. The career of the last great Ayyubid ruler, al-Salih Ayyub (r. 1240–1249), was struck short due to disease. This left an outcast heir, other Ayyubid claimants to power, and crusaders marching on Cairo to start the Seventh Crusade (1248–1254). It was only the quick actions of al-Salih's widow Shajar al-Durr (d. 1257) that saved the day. Hiding her husband's death from all but his most trusted advisors, forging her husband's signature, and imposing an oath of fealty in the name of her son Turan-Shah (d. 1250), she was able to hold remnants of the state together to

repel the crusaders. At the Battle of Mansura (1250) the crusaders were defeated. During their retreat to the coast the army was decimated, and the French king Louis IX (r. 1226–1270) was captured and ransomed.

Once in Cairo, Shajar al-Durr had her son pronounced sultan, and news of al-Salih Ayyub's death was finally released. One of the first acts of the new sultan was to promote his own private guard at the expense of his father's military commanders. The former commanders, military slaves, or *mamluks* (Arabic for "taken in possession"), known as the Bahriyyah because of the location of their fortress on one of the islands of the Nile River as it flowed through Cairo, did not approve of their demotion and engineered a coup in 1250 that eliminated Turan-Shah and effectively ended the Ayyubid dynasty. Although minor Ayyubids continued to rule elsewhere for another century, none would ever rule outright.

Although Shajar al-Durr had displayed acumen as a ruler, Egypt's stature as the military and political champion of Islam caused many to call for a male ruler. The choice fell to al-Muizz Izz al-Din Aybeg al-Turkumani (r. 1250–1257), one of al-Salih Ayyubid's most trusted slave-soldiers and the first Mamluk sultan of Egypt. It is important to note that the use of military slaves was already long established by the thirteenth century. Born as unbelievers on the outskirts of the Islamic world, these individuals were bought as youths, trained in military tactics and practice, converted and given an Islamic education, and finally manumitted (freed) upon completion of training. Ostensibly they provided a loyal cadre for their patron and came to forge a group identity, separate from other groups belonging to other leaders. In this way they developed a modified corporate identity, with their servile origins as a hallmark. In terms of the dynasty's legitimacy, they relied on the faded prestige of Saladin's line. Though they initially served the Ayyubids, the Mamluks, as this sultanate would become known, briefly used the Ayyubids as puppet rulers before deposing them outright.

Internal power struggles and conflicting interests led to Aybeg's murder in 1257 when he was at the height of his power. In the resulting disorder, two major groups competed for power: the remnants of al-Salih Ayyub's mamluks (the

➤ THE MAMLUK DYNAMIC

The mamluk system as it came to be practiced in Egypt during the Ayyubid period (1071–1250) and after the subsequent usurpation of power under the Bahri (1250–1382) and Burji (1382–1517) dynasties was rare and noteworthy in that a former slave could become a ruler. The dynamics of the system revolved around the *khushdash* (military household), meaning those soldier-slaves obtained, trained, and emancipated by a master, known as the *ustadh*. As mamluks were originally slaves, often imported at a young age and from alien lands, the *ustadh* became an important part of an individual mamluk's identity, extending to the adoption of the *ustadh*'s name as an honorific (e.g., a mamluk of al-Salih Ayyub was referred to as "Salihi").

Additionally, this identification extended to the other mamluks in the service of one's *ustadh*. This bond of loyalty and brotherhood, known as *khushdashiyyah*, created a cohesive group, and the success of one meant the success of all. Thus, when a member of a *khushdash* was promoted to a political or military office, other members from his military household served as his most trusted auxiliaries. The most preferable position for a mamluk was becoming a royal mamluk, which meant having the ruling sultan as one's *ustadh*.

The relationship was reciprocal. A mamluk needed his *ustadh* to advance, and the *ustadh* needed mamluks to prosecute his agenda. However, as the system evolved, individual mamluks became masters in their own right, forming their own military households and purchasing their own mamluks. Thus, while a mamluk used his *khushdash* to obtain power, his first move was often the liquidation of his comrades in favor of his own mamluks. This dynamic, while seemingly unstable, provided extended periods of durable rule for both Egypt and Syria during each region's premodern history.

—Rasheed Hosein

Bahriyyah) and those of Aybeg (the Muizziyyah). Rising out of the political intrigue, Qutuz (d. 1260), a mamluk of Aybeg's cadre, achieved supremacy. The remaining members of the Bahriyyah were relocated to Syria. However, a dire threat to the Islamic world again altered the

dynamics of the Mamluk sultanate, as the Mongols descended from the central Asian steppes and smashed Baghdad in 1258, killing the Abbasid caliph al-Mustasim (r. 1242–1258) and ending the cultural and religious hegemony of the once proud city. Qutuz would lead the Mamluks to victory over the Mongols at the Battle of Ayn Jalut in 1260, stopping the Mongol advance in Syria, but just after the battle the Bahriyyah faction struck him dead and elevated one of its own, Baybars I (r. 1260–1277), to the rank of sultan, inaugurating the Bahri dynasty that would rule Egypt until 1382.

Of the Bahri sultans, the reigns of Baybars I, Qalawun (d. 1290), and al-Nasir Muhammad (d. 1341) rank the highest. Under Baybars I, the Mamluks effectively fought the Frankish crusader presence in the Levant, captured the city of Antioch in 1268 (something Saladin could not accomplish), established a border with the Mongol il-khanate of Persia (1256–1336), and even briefly retook Seljuk Anatolia. Qalawun's rule was noted less for its conquests and more for its diplomacy, as Qalawun entered into treaties that exploited the existing divisions over the right of succession among the crusader states. Through this strategy Qalawun was able to conquer three of the four major crusader strongholds (Tripoli, Tyre, and Jaffa). By 1290 only Acre remained, but just as Qalawun was massing his forces outside its walls, he fell ill and died. The city fell to his successor al-Ashraf Khalil (r. 1290–1293) in a blood-bath the following year, and the last major crusader bastion in continental Southwest Asia was effectively removed. After the untimely death of al-Ashraf, his successor al-Nasir Muhammad (d. 1341) had the longest rule of any Mamluk sultan. Beginning in 1293 with the murder of his brother and predecessor, he ruled with two brief interruptions until his death. He was noted for his public works and was much revered for championing Egypt's Sunni revival. The period of al-Nasir Muhammad also witnessed the demographic shift that finally made Egypt a majority Muslim territory. Prior to his reign, evidence indicates that Egypt was still a majority Coptic Christian land.

Despite amassing vast wealth and power, the reigns of the later Bahri Mamluk sultans largely constituted a period of decline. The favorable

position of Egypt on the spice trade routes from the Red Sea and the overland Silk Road from central Asia generated vast wealth for the Mamluk dynasty. One late-fifteenth-century Portuguese writer estimated that the Mamluk sultans received annually 600,000 gold coins in tax revenues from the spice trade alone. Added to this was the practice of importing slaves, which made Egypt a trading powerhouse. However, as new markets opened, the ethnic makeup of these new slaves began to change.

While the majority of the Bahri mamluks were ethnically Qipchak Turks, these new slaves were Circassian from the Caucasus, and they began to forge a new dynasty known to history as the Burji Mamluk dynasty (1382–1517). Beginning with a revolt in 1382, al-Zahir Sayf al-Din Barquq (r. 1382–1399) was able to topple the Bahri regime and elevate the Burji. These sultans are largely viewed as inferior in comparison to their predecessors, but this may be due to the major shift in power and authority in the Islamic world that accompanied the rise of the Ottoman dynasty (1299–1923) and the devastation that the Black Death inflicted on Egypt's population.

Egypt eventually was incorporated into the Ottoman polity after its defeat by Selim the Grim (r. 1512–1520) at the Battle of Marj Dabiq (1517), thereby ending the Mamluk dynasty.

The Il-khanid Dynasty of Persia

The Il-khanid dynasty of Persia (1256–1335), centered in Mesopotamia, Iran, and adjoining territories, was originally an integral part of the

Mongol empire, with its il-khans (subordinate khans) subject to the authority of the Great Khan in China, the successor of Chinggis Khan. The political turmoil into which the Mongol empire was plunged in 1259 with Mongke Khan's death, however, allowed the Il-khanids to go their separate way, although they continued for quite a while to acknowledge the suzerainty of the Great Khan who, in the reign of Khubilai Khan (r. 1260–1294), became the Yuan emperor of China. Although originally shamanistic in religious orientation and culturally nomadic, by the end of the century the Il-khanids ruled over an officially Islamic state that adopted and patronized the ancient and richly variegated cultural traditions of the region. With the death of Abu Said Khan (r. 1316–1335), the direct line of succession ended, and the il-khanate broke up into a number of competing petty principalities that were swept away in the 1380s and 1390s by Timur-i Leng (also known as Tamerlane, 1336–1405), a man who claimed to have inherited and reconquered the il-khanate. In fact, he established a new dynasty, the Timurids, and a new political entity.

In 1253 Mongke Khan, a grandson of Chinggis Khan, sent his trusted brother Hulegu (1216–1265) from Mongolia to Iran to destroy the Ismailis, a sect also known as the Assassins. According to one story, they had threatened the life of the Great Khan, and a local Muslim *qadi* (judge) had also petitioned the Mongols for help against the Assassins ensconced in the fortress of Alamut in northern Iran. Apparently, Hulegu was also to demand that the Abbasid caliph of Baghdad acknowledge Mongol overlordship.

It took Hulegu three years to complete the mission of effectively destroying the Assassins of Iran (but not of Syria) and reducing that land to Mongol rule. Whatever Hulegu's or the Great Khan's original plan, Hulegu did not return to Mongolia after the mission. He and his army moved on to Mesopotamia, where they besieged Baghdad. When Caliph al-Mustasim (r. 1242–1258) refused Hulegu's generous offer to spare the city and the caliph's office and life in return for submission, the Mongols and their allies invested and looted the city and murdered the caliph in February 1258, thus effectively ending a dynasty that had reigned for more than five centuries.

Mongols under the leadership of Hulegu Khan storming and capturing Baghdad in 1258, from the Jam al-Tawarkh, by Rashid al-Din, about 1310. (The Art Archive/Bibliothèque Nationale Paris)

According to a letter that he sent in 1262, Hulegu claimed that more than 200,000 died in the massacre that ensued. The Mongols took countless items and people as booty, including Baghdad's artists and scientists such as Nasir al-Din Tusi, who would run an astronomical observatory that Hulegu established on a hill outside Maragha, the first Il-khanid capital.

After conquering Mesopotamia, Hulegu proceeded westward until the Mamluks of Egypt forces halted his advance at Ayn Jalut in the Galilee (present-day northern Israel) in 1260 and forced his retreat back into the heartland of Persia. Although Hulegu's successors would repeatedly invade Syria after 1260, they never stayed for long. The advance of the Mongols into the so-called Middle East had been stopped but not before Hulegu had captured most of Anatolia as well as Iran and Mesopotamia.

In 1259 Mongke Khan died in China, and a war of succession ensued, but circumstances were too dangerous for Hulegu to march east and join the race for the Great Khanate. He faced the enmity not only of the Mamluks, who now occupied Syria, but also of his cousin, Berke (r. 1257–1267), khan of the Golden Horde. Berke, the Mongol leadership's first convert to Islam, disapproved of Hulegu's actions at Baghdad to the point that he entered into what became a long-standing alliance with the Mamluks against

➤ RELIGION UNDER THE IL-KHANIDS

Originally, the Mongols were a shamanistic people who combined animistic practices with forms of Tibetan Buddhism. Hulegu himself was such a Buddhist, but his trusted general Kito Bhuqa was an Assyrian (Nestorian) Christian. Once established in Persia, Il-khanid rulers before Ghazan practiced, or at least patronized, a wide range of religions, but it is questionable how seriously they were attached to any of them. What is clear is that until Ghazan's conversion to Islam, many different religious groups flourished in Persia.

Early in the Il-khanid era, Assyrian and Jacobite Christians played an influential role. Assyrian Christianity was especially popular among Mongol elites and the wives of various il-khans. Indeed, baptism was a popular practice with Il-khanid royalty. Arghun, for example, although a Buddhist, had his son, the future Oljeitu Khan, baptized under the Christian name Nicolas in honor of Pope Nicholas IV, with whom Arghun's ambassador to the West, Rabban Sauma, had negotiated. Very much a religious adventurer, Oljeitu also espoused Buddhism for a while before he converted to Islam, and as a Muslim he vacillated between the Shia and Sunni branches of the faith.

This laissez-faire policy toward religion changed under the next il-khan, Ghazan, whose conversion to Islam in 1295 proved to be a major turning point in Il-khanid history. A policy of conversion or exile was put in place, and it was in this context that Rashid al-Din converted to Islam. Ghazan also ordered the destruction of Buddhist shrines, and as a result very little is known today about Buddhist architecture in Persia.

Notwithstanding Ghazan's fervor for his new faith, he maintained diplomatic relations with Christian rulers to his west largely because two nearby Muslim powers, the Mamluks and the Mongol Golden Horde, remained his enemies.

—Kumi S. Martin

Hulegu and went to war against the Mongols in Persia in 1261 or 1262. Another factor that kept Hulegu from going east was that the grasslands of northern Persia were suitable for maintaining Mongol soldiers and their horses. Consequently, he established the seat of his authority at Maragheh, located in present-day southern Azerbaijan.

His son and successor Abaqa (1265–1282) moved the capital to Tabriz in Iran, which served this function until Oljeitu Khan (r. 1304–1316) built a new capital city, Sultaniyya, in Iran. Abaqa also built a palace known as Takht-i Suleyman, which was decorated with Chinese and Islamic motifs. This new Sino-Islamic decorative vocabulary became the dominant feature of late medieval Islamic art.

Although the Il-khanids built lavish permanent palaces, they did not abandon the Mongol custom of living in *gers* (known to the Turks as *yurts*), or circular tents with an internal wooden frame. However, unlike the simple felt *gers* of the steppes, these tents were extremely luxurious, often woven with silks and embroidered with gold.

The short reigns of Teguder Ahmed (r. 1282–1284), Arghun (r. 1284–1291), and Geikhatu (r. 1291–1295) were followed by the longer and more significant reign of Ghazan (r. 1295–1304). Up to this point the il-khans had largely been shamanistic animists who favored Tantric Buddhism, although Teguder had converted to Islam, and Arghun seems to have taken Buddhism seriously and patronized Persia's Assyrian (Nestorian) Christians. As soon as Ghazan succeeded to the throne, however, he wholeheartedly converted to Islam, thereby ending the il-khanate's nominal subordination to the Great Khans in China. At the same time, political relations between China and the il-khanate continued because of the threatening presence of the Golden Horde and the Mamluks of Syria and Egypt.

Ghazan attempted to reform the il-khanate's economy with the help of his chief minister Rashid al-Din, a Jewish convert to Islam, physician, theologian, historian, and statesman. In order to secure a stable source of revenue, Ghazan imposed a new tax system and ordered all properties registered for taxation. Coinage and the official system of market weights were also reformed, at least officially, and the postal system was improved in order to expedite the delivery of documents and decrees across the il-khanate and to ensure the safe travel of envoys. The most significant reform attempted was paying a regular salary to soldiers rather than allowing them to enrich themselves through plundering. How effective all of these attempted reforms were is open to question.

Ghazan's brother Oljeitu (r. 1304–1316) succeeded to the il-khanate and managed to expand its territory to the Caspian Sea. Other than that, his most important contribution was as patron of a major building program, especially of religious structures. He ordered his own mausoleum to be constructed at his new capital city, Sultaniyya. Another of his contributions to medieval Persian culture was commissioning Rashid al-Din to write the *Jam al-Tawarikh* (*Collection of Histories*), a massive world history that ranges from China to the West, covering such topics as Jewish history, pre- and post-Islamic Persia, the Prophet Muhammad, the caliphs, and, of course, the Mongols.

After this brief revival, the 11-year-old Abu Said (r. 1316–1335) took the throne. Although he eventually was responsible for a significant change in Il-khanid foreign relations by making a peace treaty with the Mamluks, he could not save the il-khanate from collapse. He died without an heir, and with his death the il-khanate essentially ceased to exist.

The il-khanate lasted less than a century, but the Mongol impact on Persia and the rest of Eastern Islam was neither short-lived nor insignificant. First and perhaps foremost, the sense of legitimacy that came with a claim to being a descendant of Chinggis Khan served well Timur-i Leng, founder of the succeeding Timurid dynasty of Persia, and Babur, founder of India's Mughal dynasty. Second, as patrons of the arts, the Mongols helped bring Persian culture to a new level, especially with the new assimilation of Chinese motifs and styles that resulted in a form of Persian art and architecture that would have a profound impact on Islamic tastes and artistic production from the Mediterranean to India, namely on art of the Ottomans and the Mughals as well as the Timurids.

Timur-i Leng's Empire

Known in the West as Tamerlane, Timur-i Leng (ca. 1330–1405) ruled a Central Asian empire from his capital at Samarqand (in present-day Uzbekistan, where today he is a national hero). Timur (more correctly, Amir Temür), who was Mongol by descent, Turkic in speech and culture, and Muslim in religion, was born into the Barlas tribe near Kish (south of Samarqand) in the late 1320s or early 30s. There is no good reason to accept as fact the traditional birth date April 9, 1336. Kish was then located within the Chaghatay khanate, which Chinggis Khan had bequeathed to his son of that name in 1227. Timur acquired the Persian nickname *leng* (or *lang* or *link*), meaning “the lame,” because of wounds that he received in an ambush in 1363/1364, which left him permanently lame in his right leg and with a crippled right arm. At some unknown time, he also lost two fingers in his right hand. These disabilities did not stop him from acquiring a deserved reputation as a skillful and brave warrior. His given name, Timur, which means “iron” in Turkish, proved fitting for a would-be world conqueror whose campaigns were characterized by wanton massacres and terror tactics.

The Chaghatay khanate, the smallest of the four divisions of the Mongol empire, encompassed the core of Central Asia. In the southwest, it extended into Afghanistan, and in the east, its neighbors were China and Mongolia. To the north, it slightly reached into (present-day) Kazakhstan, and in the south, it was bordered by India and Tibet. After the Great Khan Khubilai moved his capital to northern China in 1274, the Chaghatay khans enjoyed a great deal of autonomy. By the late 1330s, however, the khanate was divided into two: Mughulistan (the land of the Mongols) to the northeast, a land of steppes and mountains, whose people were still largely traditional pastoralists and animistic in religion, and Transoxiana (also known as the Ulus Chaghatay) in the southwest, which was centered on the ancient, now Islamic cities of Bukhara and Samarqand. Timur's homeland and future seat of

power was in Transoxiana, where he established the Timurid dynasty, which flourished for only a century after his death (1405–1506) but which gave birth to the great Mughul dynasty of India (1526–1857). Timur never managed to incorporate Mughulistan into his empire, and its khans survived into the mid-seventeenth century.

Timur, who began his career as a brigand, supported the initial invasion of Transoxiana in 1360 by the Chaghadayid khan of Mughulistan, Tughluq Temūr (r. 1347–1363). For his support, Timur was made chief of his tribe and *amir* of the region around Kish. When Tughluq Temūr returned in greater force in 1361, he installed his son Ilyas Khoja as ruler of Transoxiana. Now unable to accept Mughul rule, Timur went into exile in Khorosan, recruiting supporters. In 1364, Timur-i Leng and his ally Amir Husayn overthrew Khoja, and Husayn declared himself head of Transoxiana, while appointing a puppet Chaghadayid khan to legitimate his rule. In 1366, Timur and Husayn seized Samarqand, ruthlessly killing off

rival Turkish rebels who held the city against the Mughuls. In 1370, the two allies fell out, and Timur acquiesced in the murder of Husayn, his sons, and Husayn's khan. He then married Husayn's widow, a princess of the blood of Chinggis Khan, thereby legitimating his rule over Transoxiana. Through this marriage he acquired the title *güregen* (royal son-in-law). He also installed his own puppet Chaghatai khan, contenting himself with the title *amir* (commander), in order to maintain the fiction that he ruled in the name of the Chaghadayid dynasty. On April 9, 1370, he assembled a *khuriltai* (princely assembly) of Ulus Chaghatai tribal leaders at Balkh, a city chosen because of its association with two other world-conquerors—Alexander the Great and Chinggis Khan. The *khuriltai*, which by tradition was the assembly in which a khan was acclaimed and accepted, formally acknowledged his authority. He also began to turn Samarqand into the splendid capital of an emerging empire that he ruled autocratically.

Timur was ever mindful of the imperial model established by Chinggis Khan and his immediate successors. However, instead of claiming the support of an indeterminate Heaven, as a Muslim he claimed to have the special blessing of Allah to establish a world empire—a sanction received through the agency of an angel. He further understood that first he must become master of his own region, uniting all tribes as Chinggis had done, and with this in mind he set out to reunite the entire Chaghatay khanate. In addition to adding to his prestige and power base, this policy also enabled him to unite more fully the fractious tribes of Transoxiana by employing their energies in war and winning their loyalty with booty. Conquest, in other words, became his chief political tool.

In 1370 he initiated a series of campaigns to conquer Mughulistan, which failed, leading to a peace accord and alliance in 1397. He was more successful in his invasion of Khorezm to his northwest, a region immediately south of the Aral Sea that commanded the rich routes of the Silk Road and which he invaded in 1372. In 1379, his army brutally sacked Urganch, ending the prosperity of a once-vital mercantile city. With this flank secured, he began his expansion westward.

Often Timur cloaked his campaigns in the mantle of religion, claiming they were jihads against infidels and deviant Muslims, but his brand of Islam was pragmatic and not ideological, despite his patronage of Sufis. Probably several million Shia and Sunni Muslims died horrible deaths as his armies rampaged through the heart of Dar al-Islam. Islamic lands that felt his wrath between 1370 and his death in 1405 (as he was preparing to invade China) included regions encompassed by the modern nations of Afghanistan, Azerbaijan, India, Iran, Iraq, Kazakhstan, Kyrgyzstan, Pakistan, Syria, Tajikistan, Turkey, Turkmenistan, and Uzbekistan. Likewise, he swept through Christian Armenia, Georgia, Russia, and Ukraine. Everywhere the progress of his armies was marked by mountains of skulls, and many of the fortunate survivors were enslaved. Systematic terror was one of the chief weapons in his arsenal.

Two of Timur's more significant campaigns were his invasion of northern India and sack of Delhi in 1398, a feat accompanied by frightful

➤ TIMUR-I LENG'S JUSTICE

In 1402–1403, Timur conducted diplomatic exchanges with a number of European Christian rulers who sought an alliance with him against the Ottoman Turks, whom Timur had defeated in 1402. One of those princes, King Henry III of Castile-León, dispatched three envoys to Samarqand, two of whom survived the journey of almost 3,000 miles (approximately 4,800 kilometers), arriving at Timur's court in summer 1404. The envoys failed to get a commitment from Timur, who was then preparing to invade Ming China. Not all was in vain. One of the ambassadors, Ruy González de Clavijo, produced a detailed account of what he experienced and saw, and it is one of our best eye-witness sources for the next-to-last days of this aspiring world-conqueror. Here he describes Timur's preparations for the wedding of his grandson in October 1404.

“By proclamation . . . he [Timur] let it be known that although he intended to gratify and give enjoyment to all the common-folk at his festival, he also intended to give a warning and make an example of those who had offended him and done evil deeds, and he would proceed to the public execution of criminals.

The first of those to suffer his justice was the chief mayor of Samarqand. . . . Earlier, when Timur had set out on his late expedition . . . this man had been appointed chief magistrate, and Timur left him as governor of Samarqand. But his Highness had learned since his return that this man had betrayed his trust, using his office to misgovern and oppress the people. He now commanded this . . . chief mayor to be brought before him, and after judgment, he was immediately taken out and hanged without delay. All the wealth he had so unjustly gathered was forfeited to the state. This act of high justice in which a person of such high rank (and notably one in whom his Highness had placed much trust) was condemned to death, made everyone tremble.”

slaughter, and his defeat, capture, and humiliation of the Ottoman Sultan Bayazid I at Ankara in 1402. The former reduced the sultanate of Delhi to a conglomeration of petty states that barely held on until Babur (1483–1530), a direct descendant of Timur, invaded and conquered northern India from his base in Afghanistan and established India's Mughul dynasty in the early sixteenth century. The latter set back the Ottoman advance against the Byzantine empire and gave Constantinople an additional half century of freedom from conquest.

Timur's campaigns and regime in Central Asia have been credited with having caused a precipitous decline of both animism and Assyrian (Nestorian) Christianity among various Turkic peoples, but there is no hard evidence to support that conclusion. His destructive campaigns across Central and Southwest Asia have also been blamed for shutting down the ancient Silk Road. This is an oversimplification. Silk Road traffic had already suffered a serious drop-off due to two mid-fourteenth-century phenomena, the Great Eurasian Pandemic (the so-called Black Death) and the Mongols' loss of China. Arguably, because Samarkand now became a magnet for scholars and artists, as well as merchants and diplomats, Timur and his family bestowed a century-long Indian Summer on the Silk Road. Timur has also been characterized by some as a military "flash-in-the-pan," who left behind nothing of political or cultural consequence. It is true that many of Timur's conquests in the West were ephemeral, but he left behind a fairly stable, albeit quickly truncated, Central Asian state ruled by a family noted for its century-long patronage of the arts, learning, science, and religion. What is more, he continued a tradition of Mongol thunder from the steppes that would serve his descendant Babur well in his conquests in Afghanistan and India.

The Early Ottoman Sultanate, 1300–1500

The legend goes that the ancestor of the Ottomans, Osman (ca. 1260–1324), saw himself in a dream slumbering with his saintly companion, the Sufi sage Edebali. A full moon rose from the chest of Edebali and sank upon the bosom of Osman and disappeared. Then a miraculous tree sprang forth from Osman's chest and grew in strength and beauty until its leaves and branches shadowed the whole earth. Under the tree, mountains stood high, rivers flowed from the roots of the mountains, and people drank from the water, watered their vegetation, and erected springs for others. After hearing the dream, Edebali knew that the moon was his daughter and the tree was the kingdom given to Osman and his progeny. Osman and Edebali's daughter were married. Osman's dynasty was destined to rule the world.

Attributed to its founder Osman, the Osmanli, or Ottoman, sultanate originated in the northwestern frontiers of Anatolia in the wake of the Mongol conquests of the thirteenth century. From a frontier principality in the beginning of the fourteenth century, the Ottoman sultanate evolved into a formidable empire on the Afro-Eurasian landscape in the sixteenth century. It embraced and furthered existing cultural traditions in the territories it ruled and brought into contact otherwise disconnected regions and cultures. The multi-cultural, multi-ethnic Ottoman empire survived the debacles of modern history until the beginning of the twentieth century, when it was replaced by the Republic of Turkey and more than 30 nation-states in its European, Asian, and North African territories.

The history of the Ottoman origins is a complicated journey deserving a world-historical context. The Ottomans originated from Turkic-speaking nomadic tribes in northern Mongolia. In their westward migration during the tenth century CE, these migrating tribes came into contact with Muslims largely through missionary activities, which commenced a process of sometimes slow and at other times en masse conversion to Islam. Paramount among these tribal groups was one led by a chieftain named Seljuk. Under his leadership, this group advanced into

the central Islamic lands and eventually dominated the Iranian plateau (1043), Iraq (1055), and Byzantine Anatolia following the victory in 1071 at Manzikert against the Byzantines, thereby leading to the formation of two coexisting Seljuk sultanates, the Great Seljuk empire and the sultanate of Rum. By the middle of the twelfth century, the larger part of Anatolia was governed by various Turcoman (Türkmen) principalities (*beyliks*), which strove to carve larger spaces for themselves against the Byzantines and each other.

The arrival of Turks into central Islamic lands initiated major changes beyond politics for both these Turkic-speaking people and the heartland of Islam. Recent converts to Sunni Islam, Seljuk leaders left the caliph in his post, being satisfied with the title “sultan” for themselves. They adopted the Perso-Islamic tradition of administration, politics, and culture in their new homeland, although they adamantly preserved the secular political traditions of Central Asia. Turkish continued to be spoken, but their high culture was expressed in Arabic and Persian. Seljukid colleges (*medreses*) produced Sunni scholars, and their system of land tenure (*iqta*), by which the administration of agricultural land was assigned to the military and administrative class in return for service, ensured effective control of the realm.

Mongol conquest of Anatolia accelerated the centrifugal movement of the Turcoman beyliks. Reduced to an ineffective vassal status, the Seljuks of Anatolia were undermined by the ambitious petty warlords (*beys*), who designated themselves *gazis* (holy warriors) struggling against Christian Byzantium and ruled over beyliks that only nominally recognized the suzerainty of the Seljuks and the Mongols. These numerous principalities, of which Osman’s beylik was but one, were constantly supplied with new migrants fleeing the Mongols. Osman’s dream illustrates well the ideology of this militant piety (*gaza*) prominent in West Asia in the wake of the Mongol conquests.

Located along the Byzantine frontier in northwestern Anatolia only a few miles east of Bursa, Osman’s beylik rose to prominence after inflicting a major defeat on the Byzantines at Baphaeon in 1301 by Osman himself and the capture

of Prusa (Bursa) by his son Orhan I (r. ca. 1324–1362) in 1326. Designed as a new seat of power, Bursa conferred an aura of permanency to the beylik, which minted its own coinage for the first time (1327) and established its first medrese, in Nicaea (renamed Iznik), immediately after its capture in 1331. The great leap of fortune for the Ottomans came after they were invited into the Balkans to get involved in an intra-Byzantine conflict. Orhan willingly crossed the Dardanelles in 1345 but was not equally enthusiastic about returning to Bursa. He established a stronghold in the Balkans, and eventually his successor Murad I (1362–1389) captured Adrianople (today Edirne) in 1361, making this ancient Southeast European city his new capital. The Ottoman crescent now encircled the faltering Byzantine empire and was poised to expand throughout the fragmented, conflict-ridden Balkans.

The consolidation and organization of the sultanate received favorable attention from Orhan’s son Murad I (r. 1362–1389), the first Ottoman to adopt the title of sultan for himself, and his son Bayezid I (r. 1389–1402). Murad contained the Byzantines and consolidated his power in Balkan Thrace with further expansion and the incorporation of local Christian knights, noblemen, and soldiers in his service. Bayezid I turned his attention to the Anatolian frontier and consolidated his authority over much of the Anatolian Peninsula. With the efforts of both sultans, a central bureaucracy and a professional army began to take shape, further removing the Ottomans from their nomadic roots and social formation. Central bureaucracy, tax collection, provincial administration, and the army were all organized and reorganized to allow the sultan direct control of his realm. The institution of a slave army was not new, but what Murad I and particularly Bayezid I created was ingenious. They recruited male children (*devşirme*) from Christian Balkan families as a levy. The children were raised as Muslims and given appropriate education and training to serve the sultan. Depending on their abilities and education, they were employed in either the civil administration or the military. The *devşirmes* served the Ottomans as the core imperial army known as the Janissaries (*yenîçeri*, or “new soldier”) until they were abolished in the early nineteenth century.

➤ BURSA—FIRST OTTOMAN CAPITAL

Green Tomb of Mehmed I, reigned 1413–1421. (Mattes/StockphotoPro)

After the Ottoman conquest of Bursa (Greek: Prusa) in 1326, this northwest Anatolian city became the Ottoman capital and remained its sole capital city until 1365, when the Ottomans conquered Adrianople (Edirne) in the Balkans. Edirne then became a co-capital from which the Ottomans governed their expanding holdings in Southeast Europe and from which they tightened the noose around Constantinople. Bursa remained the administrative center for the more expansive Ottoman lands in Anatolia, and it remained so until Constantinople (Istanbul) was captured and transformed into the sole Ottoman capital. Nevertheless, Bursa remained a major center for provincial administration.

—Alfred J. Andrea

By the fifteenth century, the Ottoman beylik was transformed into a prominent sultanate and was poised to incorporate Byzantium. However, everything came to a sudden halt in 1402. The Çagatatay Turkish conqueror Tamerlane (Timur-i Leng) claiming heirship to the Mongols and having swept across western central Asia since 1360, inflicted an almost-mortal blow to the Ottomans in the middle of the Anatolian Peninsula. At Ankara, the site of Turkey's modern capital, he destroyed Bayezid's army; captured the sultan, who died a few months later of grief; and pursued the remaining Ottoman army across the Dardanelles. What remained of the Ottomans after the battle was, for more than a decade, a bitter civil war among Ottoman princes over whatever they could salvage from the ruins.

When fraternal strife finally diminished, Mehmed I (r. 1413–1421) was recognized as sultan in 1413. He recovered much of his father's territories and struggled to pacify rebellions by princes, centrifugal Turcoman tribal groups, and charismatic religious figures. His son Murad II (r. 1421–1451) undertook a major rebuilding project. He consolidated the Ottoman territories, erased the effects of the civil war, revitalized the *devşirme* recruitment system, and attended the rebuilding and restoration of prominent cities. When he passed away and left his throne to Mehmed II (r. 1451–1481), the Ottoman sultanate was secure, centralized, and prosperous and, far from its origins, was a sedentary Islamic empire.

Mehmed II, known as “the Conqueror” (Fatih), exemplified the inauguration of the Ottoman classical age. The landmark achievements of Mehmed II were the capture of Constantinople in 1453 and the uniting of his sultanate's territories in the Balkans and Anatolia. He put Serbia under Ottoman control, eliminated the last vestiges of the Byzantine empire in Anatolia, and entered a protracted struggle with Venice until 1479. The economic, political, and psychological benefits of his conquest of Byzantium cannot be overestimated. It catapulted the Ottoman state from an upstart sultanate into an empire integral to the early modern Islamic Middle Eastern and European imperial politics. Mehmed II extended the function of the *devşirme* system to the detriment of Turkish aristocratic families, which he

viewed as dangerous to his throne, and organized the administration to shore up the responsibilities of government institutions. Another landmark achievement was the collection and promulgation of administrative laws (*kanun*), which were then put into codes (*kanunname*) to make up imperial laws. Ruling over a large Christian population, Mehmed II fostered the toleration and autonomy of religious communities in an arrangement to be later known as the *millet* (religious community) system. Constantinople underwent an overhaul, and the mushrooming new monuments gave the city its new Islamic character.

His conquest of Constantinople made Mehmed II immune to threats. However, his death in 1481 sparked another episode of confrontation between the *devşirme* and the Turkish aristocratic families over who would succeed him. The *devşirme* won the competition, and his son Bayezid II ascended the throne with their help and support. Unlike his father, Bayezid was a calmer sultan with little desire for further conquest. His limited successes in the Balkans and his inconclusive rivalry with the Mamluks in Egypt were overshadowed by his achievement in preserving the sultanate and providing a calmer period for political stability, urban and economic expansion, and administrative organization. By the beginning of the sixteenth century, the Ottoman sultanate was ready to become a naval power and a formidable contender in the rivalry for the supremacy in the Mediterranean. When Selim I ascended the throne in 1512, the Ottomans were facing another great threat from the East, the newly emerged but extremely active power, the Safavids, who came to occupy a good portion of his reign.

Al-Andalus

By the year 1000, Muslims had ruled Al-Andalus for almost 300 years. The greatest years of Islamic rule began with Abd al-Rahman I (756–788), a nephew of the Umayyad caliph, who fled Syria in 750 because of his family's defeat by the Abbasids and arrived in the Iberian Peninsula several years later. He established his capital at Córdoba, where his descendants ruled for the next 250 years. A caliphate (in opposition to the Abbasids at Baghdad) was declared in 929 and ushered in a Golden Age of Islamic rule on the western edge of the medieval Mediterranean Islamic world.

However, the strength of the Umayyads in Al-Andalus was not as great as it appeared, and the dynasty weakened after 1000 CE. The spread of a *fitna* (a civil war with religious implications) broke out and resulted in the collapse of the caliphate in 1031. With the loss of centralized rule, the peninsula divided up into more than 20 small kingdoms called *taifas* (factions). Berber tribes ruled the *taifas* of Málaga, Granada, Valencia, Badajoz, and Toledo, while Arab families ruled those of Seville and Zaragoza. Despite political fragmentation, this period was a time of flourishing culture in the arts. One extant architectural example is the palace complex of the Aljafería in Zaragoza (Saragossa) built by the Ibn Hud family.

The weakening of Islamic rule in the Iberian Peninsula gave Christian rulers to the north an opportunity to expand their territories at the expense of their Muslim neighbors. The *taifa* kingdoms were militarily shaky, so they asked for help from an emerging Berber dynasty in North Africa, the Almoravids (1056–1147), that had

► THE ALHAMBRA

The Alhambra is an Islamic palace-city located adjacent to the city of Granada. Its name derives from *al-qasr al-hamra* (red palace) because of the iron-rich earth used to construct its walls. The hilltop site dates back to at least the ninth century, when troops of the Umayyad emir Abd al-Rahman II (822–852) stayed there. The site was also occupied by the Zirid taifa kingdom in the eleventh century, the Almohads in the twelfth century, and the Nasrids in the thirteenth century.

The Alhambra's greatest expansion was done in the fourteenth century under the Nasrid sultans Yusuf I (1333–1354) and Muhammad V (1354–1359, 1361–1391). Completely surrounded by walls, the Alhambra became a permanently inhabited palace-city that also served as the capital for the dynasty. Gardens, mosques, markets, prisons, a mint, a cemetery, and housing for service personnel were all found within the walls. Although self-sufficiency was never a factor, there were storage spaces for food, and small vegetable gardens and fruit trees were kept throughout the grounds.

After 1492 the Alhambra became a seasonal residence for the Spanish monarchy. The city fell into disrepair by the 1700s and was partially destroyed by Napoleon's troops in 1812. After use as a powder magazine, a fish-cleaning operation, and a home for transients, the site was largely taken over by the Spanish provincial government in the late nineteenth century and is today one of the leading tourist attractions in Spain.

—April L. Najjaj

been founded by the military and religious leader Yusuf ibn Tashufin. They established a capital at Marrakesh in 1062 and expanded throughout North Africa. Upon arrival in Al-Andalus, their disapproval of the lifestyles of the *taifa* rulers led them to not only fight the Christians but also take over most of the small kingdoms and eventually place all of Al-Andalus under Almoravid rule.

Back in North Africa, a second Berber dynasty, the Almohads (1130–1269), defeated the Almoravids and built an empire that stretched from present-day Morocco to Tunisia and Tripoli in the east. Their founder, Ibn Tumart, died in

1130 and did not live to see the triumph of the group he founded. The Almohads killed the last Almoravid ruler in 1147, incorporated Al-Andalus into their empire, and established a northern capital at Seville. Despite their religious intolerance, the Almohad period produced works of literature, philosophy, and architecture, such as La Giralda, the present-day bell tower of the cathedral of Seville, the remains of a mosque's minaret that was built around 1185. It has a twin in Marrakesh, Morocco.

Almohad rule in Al-Andalus did not endure much longer than the Almoravids. Defeat at the hands of Christian forces at Las Navas de Tolosa in 1212 signaled not only the end of the Almohads but also the beginning of the end of Islamic rule throughout Al-Andalus. The ensuing power vacuum allowed Christian armies to conquer cities that had been ruled by Muslims for more than 500 years: Córdoba in 1236, Valencia in 1238, and Seville in 1248. Internal weaknesses among Christian rulers in the north, however, led to increasing disagreements, and the Reconquista faltered and ground to a halt, leaving southern portions of the peninsula in Muslim hands.

The last Islamic dynasty of Al-Andalus, the Nasrids (1238–1492), was founded by Muhammad Ibn Nasr (1195–1273), who established a capital at Granada. As Muhammad I, he began renovations on a residence located on top of a hill adjacent to the city that was greatly expanded over the next 100 years. Known as the Alhambra, the site became the permanent royal residence for the Nasrid dynasty. Granada itself overflowed with refugees streaming in from northern cities recently conquered by the Christians. This latest kingdom, however, was just a shadow of the former Al-Andalus, which by now only included the tip of the peninsula south of the Guadalquivir River.

Sandwiched between the northern Christian kingdoms and the Marinids of North Africa who had displaced the Almohads, the Nasrid sultans ensured their survival for the next 250 years through the accident of geography (mountains to the north, sea to the south) as well as the exercise of careful diplomacy and regular tribute payments. Throughout its history, however, the dynasty was plagued by family squabbles and political intrigue, with the result that few Nasrid

sultans died of natural causes. The height of the dynasty was with Yusuf I (1333–1354) and his son, Muhammad V (1354–1359, 1361–1391).

The last century of Islamic rule can be described as brief periods of peace between ongoing war with the Christians. Dissent within the Nasrid ruling family had further destabilized the government, and rampant inflation with recurring food shortages led to widespread discontent and revolt. The last Muslim ruler of Spain, Muhammad XII (1486–1492), known to the Spanish as Boabdil, entered into negotiations with Fernando and Isabel and surrendered in the Alhambra on January 2, 1492. He eventually died in exile in North Africa.

Boabdil surrendered in part because of the *Capitulaciones*, an agreement signed with Fernando and Isabel in 1491 that allowed the Muslim population of Granada to continue practicing its religion and living under its own law. In addition, they were assured that they could keep property and stay in the country if they wished or be free to sell their property at a fair price and leave for North Africa. Despite these assurances, the Spanish government declared the *Capitulaciones* null and void by 1500, and the last Islamic communities of Al-Andalus were forced to convert to Christianity. Nevertheless, the new converts (now called Moriscos) were still culturally Muslim and never assimilated to the new political, social, and religious realities of

sixteenth-century Spain, thereby engendering investigation and persecution by the Spanish Inquisition. They were eventually expelled from the country by 1614.

Al-Andalus ceased to exist as a political entity in 1492, but the reality of almost 800 years of Islamic rule in the Iberian Peninsula endures in the historical memory of not only Spain but also the whole of the Islamic world. Large numbers of Muslim refugees left the newly unified Catholic Spain and made their way to North Africa. Even today, there are many social and cultural similarities between people in southern Spain and northern Morocco. This legacy is not only in North Africa but throughout the Middle East as well, and historians, poets, and artists in the Islamic world remember with pride and nostalgia the centuries of Islamic rule in Al-Andalus.

■ Introduction: India—The Heart of the Indian Ocean Community

The Indian Ocean was the economic and cross-cultural center of Afro-Eurasia in the period 1000–1500, although the largely land-fixed Mongol empire challenged that position for a bit more than a century. Given the Indian Ocean's role in joining Africa and Southwest Asia to East Asia, it is not surprising that the Indian subcontinent served as the heart of this great ecumenical complex of cultures and politics. India, as had been true for essentially all of its history to that time, was politically divided

during these centuries, but that was a major factor contributing to its role as the essential core of Afro-Eurasia.

The sultanate of Delhi ruled over the northern regions of India from the early thirteenth century to 1526, and the successive Turco-Afghan dynasties that held the sultanate tied India to the Central Asian lands that lay beyond northwestern India's Hindu Kush mountain range and, more significantly, to the larger world of Dar al-Islam. Because of the sea routes of the Arabian

Sea, the Persian Gulf, and the Red Sea, western India had been connected economically and culturally with the lands of Southwest Asia, most notably present-day Iraq and Iran, since antiquity, but its ties were now far closer. This was due not only to improved seagoing vessels and navigation tools but also to the simple fact that the rulers of these regions shared a common religion. Moreover, Muslims from much farther away also had good reason to seek opportunities in India, even though Muslims constituted only a small percentage of the sultanate's inhabitants. In fact, because of that demographic imbalance, adventurous Muslims from afar sought political preferment in northern India.

On September 12, 1333 (or 1335), Ibn Battuta, a native of Tangier, Morocco, crossed into the Indus Valley from Afghanistan and from there traveled to the court of Sultan Muhammad Tughluq. The sultan and his predecessors had been successfully holding off Mongol advances for more than a century and, along with the Mamluks of Egypt and Syria, had earned the reputation as premier champions of Islam. This reputation and the fact that the sultanate was a refuge from the Mongol scourge added to its allure, as skilled and learned Muslims, especially from Southwest Asia and western Central Asia, streamed into Delhi and other cities of the north, transforming them aesthetically and culturally. Joining them were many persons on the make who possessed more confidence and ambition than skill or learning. Such a one was Ibn Battuta. Although his legal studies had been spotty, he was invested with the office of *qadi*, or religious judge, an office he held for about seven years, becoming an exceedingly rich man in the process.

Around 1340 Ibn Battuta traveled south to India's Malabar Coast from where he planned to travel on a diplomatic mission to the court of the Yuan emperor of China, Toghun Temur. As Ibn Battuta made his way down the west coast, he discovered a number of small, fairly autonomous maritime principalities that competed for the lucrative oceanic trade that passed through India's ports on both coasts. At Kozhikode (known to the Arabs as Kalikut and later to the British as Calicut), he discovered that the local ruler, the *samudri raja*, promoted commerce by cere-

moniously welcoming and protecting merchant visitors, including ensuring the integrity of shipwrecked cargoes and returning them whole to their owners. Another traveler to Kozhikode, the Muslim-Chinese Ma Huan who arrived there one or more times while with the fleets of Zheng He in the early fifteenth century, reported that the local "king" appointed officers who negotiated fair prices for all merchandise and guaranteed that these prices would not be altered. Obviously, as was true for contemporary coastal Italy, the Swahili cities of East Africa, and many other entrepôts across the Indian Ocean, political autonomy and resulting competition were conducive to vibrant commercial activity.

South India had been active in Indian Ocean enterprises since at least the first century CE, with the Bay of Bengal to the east providing an avenue to Southeast Asia and beyond. The Chola dynasty, which enjoyed its apogee of power and influence from about 985 to roughly 1070 (but persisted into the early thirteenth century), gave its name to India's eastern shore, the Coromandal (Chola Circle) Coast. During its period of heightened power, this Tamil empire also controlled the Malabar Coast and extended its imperial reach to Ceylon (Sri Lanka) and the Maldiv Islands and as far east as Sumatra. The Chola dynasty's navy was the strongest in the Indian Ocean during the eleventh century, and in 1025 it defeated the fleet of Srivijaya, a maritime empire that encompassed the Malay Peninsula and many of the islands of present-day Indonesia. The singular artistic achievement of the Cholas was cast bronze religious statuary, especially of *Shiva Nataraja* (Shiva, Lord of the Dance). The fact that numerous Chola bronze statues of Buddhist and Shaivite (relating to Shiva) divinities have been found in the coastal regions of Southeast Asia is testimony of the far political, economic, and cultural reach of this empire down to the early thirteenth century.

Numerous other examples can be cited of the central role in the Indian Ocean played by India's numerous polities during these five centuries. Suffice it to say, to change the metaphor, that India was the fulcrum of the Indian Ocean from well before 1000 CE and continued to play that role during this half millennium, just as the

Indian Ocean was the center of Afro-Eurasia. It was no simple happenstance that brought the fleets of Zheng He and Vasco da Gama to India at the very beginning and very end of the fifteenth century.

—Alfred J. Andrea

The Late Chola State in Southern India, 1000–1250

It was during the last phase of its reign, often identified as the medieval phase of empire, that the Chola dynasty reached its apex. Whereas the earliest Chola phases are quite difficult to identify and study due to scant evidence, this last period is far clearer, confirming the dynasty's wide-ranging influence and power.

With the invasion of northern Sri Lanka by Rajaraja Chola I (r. 985–1014) that was completed by Rajendracola Deva I (r. 1014–1044), the establishment of control of the Gangavadi district by Rajaraja Chola I (r. 985–1014) located today in the modern state of Karnataka in southwestern India, the conquest of Kerala (approximately by 996) on the Malabar Coast, and the invasion by Chola fleets of the Malay Archipelago by Rajendracola Deva I (r. 1014–1044), Chola expansion extended far beyond the traditional boundaries of the Tamil cultural area. Nevertheless, the last two centuries of the empire were marked by resistance and the reemergence of forces previously kept under control by the Cholas, forces that now claimed their own suzerainty and tried to reaffirm their ambitions of independence. Thus, the Sinhallas in Sri Lanka, the Chalukyas in the western Deccan Plateau of south-central India, and the Tamil Pandyas in their traditional territories in southern India never ceased being a threat to the empire. For this reason, starting in the tenth century, in order to keep the equilibrium of power in the region, Chola sovereigns were often engaged in battle with the many ethnic-political components of southern India.

This last phase also saw many great Chola sovereigns who were able to extend and consolidate the empire's boundaries and administer the state ably. The first great emperor responsible for a number of Chola successes during this medieval phase was Rajaraja I who, at the end of his reign,

SHIVA NATARAJA (SHIVA LORD OF THE DANCE)

(Jupiterimages)

The most famous sculptural motif of the southern Indian school, superbly rendered in bronze, is Shiva Nataraja, or Shiva Lord of the Dance. According to the Dravidian imagination, Shiva's dance, the *Nadanta*, epitomizes the conception of life as an eternal becoming. Here Shiva, the Lord, personifies the universal flux of energy in all matter, the forces of creation and destruction within the cosmic system.

—Sara Mondini

had annexed two archipelagos southwest of India: the Lakshadweep Islands and the Maldives. His son Rajendracola Deva I and his son's successor, Rajadhiraja (r. 1044–1054), were responsible for the further extension of the Chola dominions and their consolidation, while Kulothunga I (r. 1070–1122) and his immediate successors could be considered the last great monarchs to ascend the throne before the decline of the empire.

The Cholas constituted the first dynasty capable of dominating the entire southern portion of the Indian peninsula, extending their territory from the west to the east coast and controlling the whole region south of the Tungabhadra River. Chola kings also were at the head of an efficient and all-pervading administration, assisted by a strong bureaucracy that was competent in executing orders and mandates. They were patrons of religion, especially the cult of Shiva, and great constructors of temples, such as the great granite temple of Brihadisvara at Thanjavur built by Rajaraja I as a testimony to his dynasty's relationship with the Divine Order. Moreover, they not only patronized religious centers but also focused on numerous worldly activities, such as commerce. Their building of a large naval fleet was not only of crucial importance for their overseas conquests but was also one of the main channels through which they extended their influence and commercial and cultural contacts within the greater South Asian network.

In the affirmation and consolidation of their empire, the Cholas also gave great importance to the arts. This medieval imperial period was characterized by the primary role accorded to Tamil culture, which enjoyed its Golden Age during these centuries. Regrettably, the majority of the Tamil literary production of this period has been lost, but the great number of literary citations and engraved inscriptions enable us to trace the outlines of numerous medieval masterpieces. The pouring out of a considerable quantity of high-quality Tamil devotional literature, especially poetry, was undoubtedly closely connected with the contemporary revival of Brahminical Hinduism, especially the cults of Shiva and, to a lesser extent, Vishnu, and the consequent erection of a large number of temples, the most important of which were dedicated to Shiva. In continuing the previous Pallava building traditions, the Cholas were able to offer a significant contribution to the further development of a Dravidian temple style. Starting in the tenth century, Chola sover-

eigns began to promote and patronize structures on a large scale. These temple complexes were enriched outside and within by elegant relief sculptures and freestanding bronze statuary. Indeed, the art of bronze sculpture reached an unparalleled level of beauty, sophistication, and technical brilliance during this age. One notable example was the emergence of the sculptural motif known as *Shiva Nataraja* (Shiva Lord of the Dance) that became a veritable hallmark of Chola religious culture. The two most brilliant results of Chola patronage are the aforementioned Shiva temple of Thanjavur (completed around 1009) and the temple of Gangaikondacholisvaram at Gangaikondacholapuram (completed around 1030). Each of these temples has been declared a World Heritage Site by UNESCO because each perfectly incarnates the maturity and grandeur of Chola architecture and art.

The decline of the dynasty seems to have begun around the first half of the thirteenth century with a progressive loss of Chola importance and prestige and the dynasty's replacement in southern India by the Pandyan empire, at that time at its apex.

The Arrival of Islam and the Sultanate of Delhi

As early as around 711 there was a Muslim presence in Sind (the area of the lower Indus that today is part of Pakistan), after the Umayyad governor of Iraq sent in a military force to combat local pirates, but Islam, as a political entity, advanced no farther into the Indian subcontinent for almost three centuries. In 997 Mahmud of Ghazni (971–1030), a Turkic warrior from a remote area south of modern-day Kabul near the Afghan-Pakistani border, initiated the first of no fewer than 17 raids into the Punjab, in the northwest region of the Indian subcontinent. Before his death Mahmud, known as "the Sword of Islam," had transformed the region into a frontier province of his kingdom.

Mahmud was interested in northwestern India mainly as a source of wealth to finance expansion of his kingdom deeper into central Asia and the building of Ghazni, his capital city. Indeed, the wealth of India helped transform his Afghan kingdom into one of the most brilliant centers of eleventh-century Islamic culture. His systematic plundering also ruined the economy of the northern Hindu states. Mahmud's desire for plunder was reinforced by religious zeal and a desire to destroy Hindu temples and sacred images. For that he is also known as "the Image-Breaker." One court chronicler claimed, with exaggeration, that Mahmud's army razed 10,000 temples in the region of one city alone. Although these raids continued almost to his death, northern Hindu princes failed to see the danger and thus failed to unite.

Mahmud's kingdom disintegrated after his death, but in the twelfth century a new kingdom, called Ghur, arose near Ghazni. In 1185 Muhammad Ghuri conquered Lahore in northern India. In 1191 the Rajputs (literally "the king's sons," a Hindu ethnic group noted for its military abilities) defeated him, but the following year he came back and defeated the Rajputs, which gave him all of India right to the gates

➤ RAZIYYA—THE FEMALE SULTAN

When Sultan Shams-ud-din Iltutmish (r. 1211–1236) died, he was succeeded by his daughter Raziyya (after she had dispatched a brother or two). There are many legends about her, but little is actually known of her short reign. Apparently she was glamorous and single, and nobles clamored to marry her because of her beauty and the throne that would come with marriage. She stalled, and when she finally chose it was too late and the wrong political choice. She and her husband were killed in 1240, less than four years after her reign had begun, and a body of palace guards, known as “the Forty,” ruled for the next six years. Raziyya was one of the first and few women to reign over a Muslim kingdom (or, for that matter, to reign in India). Because she was a woman, however, her overthrow was almost a foregone conclusion, as was that of her Egyptian contemporary, Shajar al-Durr, who also fell victim to mamluk (slave-soldier) intrigue.

—Fritz Blackwell

of Delhi. Thereafter his generals conquered the eastern Gangetic plain clear through Bengal.

Unlike Mahmud, Muhammad’s purpose was conquest. He was successful in that pursuit for three broad reasons. First, the Hindu kingdoms of northern India were stagnant and disunited. Second, Muhammad’s armies, which included tough Afghan fighters and skilled Persian cavalry, were overall superior to those of the Hindus. The equally tough and skilled Rajputs were too few to stem the tide. Finally, as Muslims these Turkic warriors were more committed to their cause not only militarily but also religiously. By the time of Muhammad’s assassination in 1206 the entire north of India was under Muslim control. Muhammad was succeeded by his general Qutb-ud-din Aybak, a freed slave who founded the Delhi sultanate’s first ruling dynasty, the so-called Slave (Mamluk) dynasty (1206–1290).

The year 1206 is a landmark date. The Hindu era of governance over northern India was over; the Delhi sultanate would reign for 320 years through five successive dynasties. It was a new

era, with a startlingly new ingredient. These new rulers were not about to be assimilated into the Hindu mainstream in the manner of previous invaders such as the Rajputs, who had originated in Central Asia. First, they were Muslims. Second, they were proudly conscious of being conquerors and Turkic chieftains from Afghanistan and neighboring areas of central Asia. Consequently, for the next three centuries they refused to see themselves as Indians and retained a distinctly separate identity, even from those Hindus whom they managed to convert to Islam.

The term “Delhi sultanate” can be misleading if it is taken as applying to a unified kingdom or empire comprising northern India. It was the dominant political power of northern India, but it was more feudal than imperial in structure. The problem was the position of the sultan vis-à-vis the nobles. Typical of Indian political history from earliest times, there were pronounced centrifugal tendencies, with regional leaders establishing their own bases of power and challenging central authority in Delhi. Four changes of dynasty as well as frequent changes of sultans within dynasties and the inability of most sultans to exercise power over the nobles, who were able to maintain and make hereditary their regional power bases, prevented the development of empire. Indeed, it was the continuation of local rulers and the basically unchanged land and tax system that allowed for underlying stability, despite the relatively frequent changes at Delhi. On occasion a sultan or two did exercise supreme power, but it was based on military force and did not last after his death. Administrative infrastructure was never developed to the extent that successful sultans could rule without having to pay personal attention to day-to-day events.

The Kingdom of Delhi—Picking Up the Pieces after Timur-i Leng (Tamerlane)

Besides destruction and death, the immediate consequence of the invasion by Amir Timuri Leng, also known as Tamerlane, was its contribution to the fragmentation of the Delhi sultanate. According to the sources, in 1399 when Amir Timur left Delhi, the Indian capital was almost depopulated and in the grip of famine and plague, offering a scene of desolation and destruction. The last Tughluq sovereign, Muhammad Shah II (r. 1399–1413), had escaped from the city, and Timur-i Leng, before leaving, appointed Khizr Khan (r. 1399–1421) governor of Multan, Lahore, and Dipalpur.

The Tughluq sultans who had succeeded Firuz Shah (r. 1351–1388) to the Delhi throne had been weak and unable to maintain a stable hold on their power. A measure of their weakness was that even after the departure of Timur-i Leng, Muhammad Shah II, a virtual prisoner of his prime minister, Mallu, was unable to retake Delhi.

Following Muhammad Shah's flight, the man who actually ruled the city was Daulat Khan Lodi (r. 1413–1414), an Afghan whom the nobles subsequently recognized as sultan after the death of Muhammad Shah. This, however, proved to be but a brief one-year prologue for what would later be the rule of the Lodi dynasty. In 1414 Khizr Khan besieged and conquered the city, thereby founding the Sayyid dynasty (1414–1451).

The Sayyid reign was not long, and it is often pointed to as one of the weakest dynasties to reign over the sultanate inasmuch as it was able to control only Delhi and its immediate surroundings, with most of its territories fragmented into numerous tribal kingdoms. Moreover, the new sovereign, despite his attempts to reorganize the administration and reconstruct the sultanate, had to face the hostility of Turkish and Afghan nobles and the majority of the non-Muslim population. As a consequence, his resources were inadequate for expanding the sultanate or giving it necessary stability.

The Lodi dynasty (1451–1526) succeeded in replacing the Sayyids in 1451, when Bahlol Lodi

➤ NEIGHBORS OF THE DELHI SULTANATE—ZAIN UL-ABIDIN OF KASHMIR AND NASIRUDDIN MAHMUD SHAH OF BENGAL

While the Delhi sultanate was ruled by the Sayyid and Lodi dynasties, their neighbors, Kashmir and Bengal, seem to have enjoyed periods of relative prosperity. In Bengal, Nasiruddin Mahmud Shah (r. 1435–1459) was probably favored by historical circumstances, inasmuch as the conflict between the Lodi dynasty and the Sharqi sultans of Juanpur (r. 1394–1479) probably kept Bengal safe from the rivalry and ambition of neighbors and allowed the sovereign to focus on his monumental building activities. This program of erecting of mosques and mausoleums promoted by Nasiruddin, who was noted for his pacific nature and interest in architecture, was an integral aspect of the steady Islamization of the region.

During the same period in Kashmir, under Muslim control since 1346, Zain ul-Abidin (r. 1423–1474) could be considered the most important sovereign to have ascended its throne. The sultan was a patron of arts and sciences and introduced Persian as the administrative language at his court. His strong dedication to reconciling Hindus and Muslims led him to allow Hindus, who had previously been obliged to embrace Islam, to return to their various Hindu practices, an act of tolerance and respect never seen in Muslim-dominated India to that point. This era of religious tolerance and political stability ended with his death, the weakness of his successors, and the formation of opposing political factions.

—Sara Mondini

(r. 1451–1489) ascended to the throne of Delhi after many campaigns directed against the city from Sirhind, where he had established his headquarters. Bahlol Lodi's role as sultan is open to debate. His historic image oscillates between someone who displayed the traits of a despot in regard to the nobles of his court, who were treated poorly by arrogant royal servants, and the portrait of a sovereign who felt comfortable seated in assembly with his nobles in accord with the Afghan tribal tradition of a king surrounded by his equals. Regardless of this debate, historians

generally acknowledge that in the face of the fragmentation of the sultanate's lands and the setting up of numerous kingdoms that had brought about the fall of the Sayyids, Lodi's founder was able to bring these disruptive forces under check.

His successor Sikandar Lodi (r. 1489–1517), contrary to Afghan tradition, demanded that his nobles acknowledge him as “all-powerful king,” a tactic aimed at consolidating his control over northern India and avoiding, or at least reducing, rebellions and the claims of the nobles to sovereign independence. Regardless, the problem of fragmentation arose again during the reign of Ibrahim Lodi (r. 1517–1526), who had to face many rebellions. But ultimately his undoing came from Afghanistan with the arrival of Babur, ruler of Kabul, who invaded India in 1526 and killed Ibrahim at Panipat, thereby establishing the Mughal empire (1526–1857).

Vijayanagara, 1336–1565

Vijayanagara, named after its capital city, Vijayanagara, from the Sanskrit “City of Victory,” was one of the most powerful empires of south-central India from the mid-fourteenth century to the mid-sixteenth century.

Despite long debates concerning the origins of its founders, historians generally agree on the crucial role of five brothers who probably came from the region of Warangal, today a district within the state of Andhra Pradesh. Around 1336 they founded the Sangama dynasty, and of the five, two—Harihara and Bukka—seem to have been the first to ascend Vijayanagara’s throne. Their capital arose south of Badami, and its impressive ruins—today a World Heritage site—surround the heart of Hampi, in the modern state of Karnataka.

Vijayanagara, whose authority extended to the whole of the Indian peninsula south of the Krishna River, has often been seen as the last bastion of Hinduism that opposed the advances of Islam from the north in a geopolitical world where this river was considered to be a cultural-political-religious boundary. Apparently one of the objectives of Vijayanagara was to serve as a barrier against the Muslims’ attempts to extend their rule from the Deccan into the southernmost regions of the subcontinent. And, indeed, the Deccan Plateau of south-central India witnessed the rise of its first independent Muslim state in 1347, the Bahmanid Sultanate, and following the collapse of the Bahmanid polity in 1527, successor Muslim sultanates in the Deccan emerged as enemies of Vijayanagara and a growing danger to Hindu independence to the south.

More than that, Vijayanagara, under Sangama guidance, was not only able to extend its territory but soon became one of the major centers of power in the Indian subcontinent. By 1377, it was the most extensive regional state in southern India. Its great capital, Vijayanagara, was a symbol and tangible manifestation of the splendor of the court and of the cosmopolitan atmosphere promoted by its sovereigns, who hosted men of literature and science, politicians and artists, and mercenary soldiers, who were drawn not only from Hindu India but also from

Muslim polities within and outside of India, such as Central Asia.

The Sangama lost power around 1485 when, profiting from the pressing threats of the Bahmanis and the Raja of Orissa, the Saluva family usurped the throne. Then, in 1503, Tuluva Narasa, a high officer of the court, succeeded to the throne, and power passed into the hands of the Tuluva dynasty.

The decline of Vijayanagara began in 1565 after the Battle of Talikota in which the empire, led by its prime minister, Rama Raya, was totally defeated by an alliance of Deccan Muslim sultanates. The pillage and plunder of the city of Vijayanagara followed in its aftermath. After the destruction of the city, Tirumala, brother of Rama Raya, and his descendants seized control of the southern remnants of a now severely truncated empire and founded the Aravidu dynasty, establishing a new capital at Penukonda. Around 1614, what remained of the empire collapsed because

➤ RAMA RAYA (1484–1565)

Despite theories concerning the constant opposition between the Muslim north and the Hindu south, the cultural and political reality of the Deccan region seems to suggest a more complex dynamic. Vijayanagara, rather than an isolated bastion, appears to have been a crucial part of the Deccan, an open terrain where politicians and men of literature enjoyed great mobility, moving from one court to another according to the winds of political change.

In this sense, the experience of Rama Raya was emblematic. His name appeared in 1512 when he was appointed military commander by the sultan of the emerging state of Golkonda. After leaving the court of Golkonda in 1515, Rama Raya appears to have crossed the Krishna River and taken up service in the Vijayanagara court during the reign of Krishna Raya (r. 1509–1529). The life and career of Rama Raya, as of other soldiers or members of the elite, demonstrated the permeability of the Bahmani-Vijayanagara frontier and the mobility between the Muslim and Hindu reigns of Deccan.

—Sara Mondini

of internal intrigues, its largest feudatories declared independence, and the empire was partitioned by the Muslim sultanates of Bijapur and Golkonda in 1646.

Until its demise, the role of Vijayanagara in the medieval Deccan was undoubtedly crucial in balancing the equilibrium of power and in constituting, together with the coeval Muslims sultanates, an articulated mosaic of regional realities and identities.

Srivijaya

The best known of the trading states to emerge in the Indonesian Archipelago was Srivijaya, a Buddhist state that came to prominence in the seventh century. Srivijaya was located in southern Sumatra, somewhere near the present site of the city of Palembang, some distance up the large, navigable Musi River, which flows into the Malacca Strait. The river provided access to large quantities of forest products and a safe harbor for Malacca Strait shipping. Initially it seems that Srivijaya could produce sufficient food locally to meet the needs of its sizable population. As it expanded to become the preeminent port in the region, it was able to secure rice from Java through a symbiotic relationship it established with the state of Mataram.

Leaving aside sundry episodes of warfare, such as that of 1016, which resulted in a temporary defeat for Mataram, these two states coexisted in a mutually beneficial, if competitive, fashion, a relationship they cemented with intermarriage. The latter was by no means the only example of astute diplomacy on the part of Srivijaya. Regular diplomatic missions to China established an excellent relationship with Chinese emperors, one that the Chinese saw as tributary, though it was probably more ambiguous from the Srivijayan perspective. Whatever its precise character, the arrangement paid off handsomely

for Srivijaya as thereby traders operating with the assent of Srivijaya and its allies and clients gained privileged access to the lucrative China trade. By such means Srivijaya expanded its power until it acquired the size and status of a major maritime empire extending its sway over the Malacca and Sunda straits and for a considerable distance along the north coast of Java.

Srivijaya's dominance eventually proved unsustainable, however. Although victorious in its battle with Mataram, the victory evidently proved draining. Less than a decade later, in 1025, another blow came when an expeditionary force dispatched by the Indian kingdom of Chola briefly captured Srivijaya's capital. Rivals to the north as well as to the south now confronted Srivijaya. But Srivijaya's biggest problem was probably its inability to sustain the monopoly on trade with China because during the twelfth century Chinese merchants began to engage directly in regional trade.

During the thirteenth century, Srivijaya's political fortunes waned. It was briefly a vassal state of the Khmer empire which was centered in present-day Cambodia and subsequently a tributary state of the kingdom of Sukhothai in what is today Thailand. It totally collapsed as an identifiable state in the fourteenth century and largely was forgotten until rediscovered by historians and archaeologists in the twentieth century.

The Khmer Empire

Between 800 and 1400 CE the Khmer empire dominated much of mainland Southeast Asia. At its height it controlled all of present-day Cambodia as well as large parts of southern Laos, eastern Thailand, and southern Vietnam. The Khmer

View of Angkor Wat and its surrounding moat. (PhotoDisc, Inc.)

empire was founded in 802 by Jayavarman II, who moved his capital from the lower Mekong to the area between the Kulen Hills and the Tonlé Sap. He marked the occasion with an elaborate Hindu ceremony aimed at fusing the temporal power of the king with that of Hindu and local deities and enabling the ruler to build a coherent state from the fragmented polities that at the time marked the Cambodian landscape.

At the center of this empire was the sprawling Khmer city of Angkor, which may have had a peak population of 1 million. Angkor was remarkable for its many stone monuments built with immense labor and intended to glorify Siva, Vishnu, and the Khmer kings. As such monuments reflect, the Khmer were originally devotees of various Hindu cults, having received religious and cultural influences from South India centuries earlier before adopting forms of Mahayana and finally Theravada Buddhism. Regardless of the devotional changes, Khmer kings stood at the apex of a sophisticated society supported largely through rice production. Its economic centrality notwithstanding, there is a considerable amount of controversy regarding one aspect of Khmer rice production. Some scholars have argued that the huge reservoirs located at Angkor and other sites may have been used to irrigate rice paddies during the dry season, while others have identified the reservoirs as having a purely ceremonial function.

Jayavarman VII, one of the last great Khmer rulers, came to power in 1181 during a period in

➤ ZHOU DAGUAN

Since the nineteenth century, archaeological research has been conducted at Angkor and other sites across Cambodia. Most attention has been paid to restoring, preserving, and studying monumental architecture; little actual excavation, which might give an insight into the daily lives of ordinary Khmer, has taken place. At these sites, inscriptions in Khmer and Sanskrit describe the activities of gods and Khmer rulers. While the bas-reliefs on the Bayon depict such common activities as food preparation and cockfighting, it is the account of Zhou Daguan that provides the only glimpse of what life must have been like in the Khmer empire.

The Chinese official Zhou Daguan arrived in 1296 as part of a Mongol trade and diplomatic mission and stayed for a year. He describes in great detail the capital, with its ceremonial bridges, elaborate colonnaded palaces, and busy markets. The Khmer ruler was an awesome figure, only leaving the palace in a great procession of elephants, guards, officials, and retainers. The king was rumored to keep between 3,000 and 5,000 concubines and to mate on a daily basis with a nine-headed serpent in the shape of a beautiful woman; failure to do so would bring disaster. Cambodians wore little clothing on account of the hot weather. Rice was plentiful; according to Zhou Daguan it could be harvested up to four times a year. Zhou Daguan felt that Cambodia, although inhabited by non-Chinese “barbarians,” was a pleasant place to live and noted that many Chinese had in fact moved there, taking Cambodian wives and engaging in trade.

—Michael Wood

which the Khmer were under increased pressure from the neighboring kingdom of Champa. This Buddhist monarch built the Bayon, the last major monument constructed at Angkor. Soon after his death the Khmer empire entered a period of sharp decline and was increasingly at the mercy of Vietnamese, Cham, and Thai armies. Angkor was sacked by the Thai in 1431.

Reasons for the decline and fall of the Khmer empire are murky. Environmental change and mismanagement of soil and water resources may have led to bad harvests. The building projects

intended to glorify the Khmer rulers, which required the services of untold laborers and artisans, may have taxed society to the breaking point. Finally, victorious foreign armies would have deported large numbers of Khmers, as was usual in Southeast Asia.

Angkor was not totally abandoned. Small-scale building projects may have been undertaken as late as the mid-1500s, and the temples were long home to Buddhist monks. But Cambodia’s political center shifted south to Phnom Penh, where it remains to this day. In ensuing centuries, Cambodia became a minor player in mainland Southeast Asia and during the nineteenth century was in danger of being swallowed up by Thailand and Vietnam before it passed under French colonial control. The French discovered the ruins of Angkor in the jungle and spent the first half of the twentieth century restoring and studying its monuments; it became and remains one of the world’s great tourist sites. For modern Cambodians, the Khmer empire has continued to be a symbol of national achievement.

The Kingdom of Laos

Before the kingdom of Lan Xang (translated as Land of a Million Elephants and the White Parasol) was established by Fa Ngum (r. 1353–1373) in 1353, it is believed that the area was mostly Khmer and Dvaravati/Mon dominated. The kingdom of Lan Xang encompassed an area that took in all of present-day Laos and the northeast region of Thailand and extended into parts of Vietnam and Cambodia. Its strength was derived from the successful unification of the various established muangs (provinces), which enabled the kingdom to become one of the strongest monarchies in the region. The kingdom’s peak period was from the fifteenth century to the latter half of the eighteenth century, when it declined due to gradual loss of territory, increased factional

fighting, and eventually loss of sovereignty to various countries, including France.

It is believed that from around 800 to about 1000 migrating Tai from China and other areas of Southeast Asia moved into present-day Laos, Thailand, and Upper Myanmar (Burma). Contemporary historians also postulate the existence of indigenous Lao within the general area who would have been living under the auspices of Khmer or Mon rulers.

During this time of migration, political and religious affairs were governed through mandalas, which were an integral part of the socio-political structure of the Dvaravati and Khmer kingdoms. Mandalas are circles of social and political power that traditionally radiate outward from the king in the center toward the other ruling parts of the kingdom. Legitimizing the power of the king and his ties to the religious center, they existed in the central Mekong area as early as 192 CE. Muangs supported the mandala by assisting in the administration of local rules and the strengthening of communal ties (in particular the strengthening of ruling families in certain areas). By the fourteenth century, it appears that the local Tai rulers had displaced the traditional Khmer or Mon mandala rulers and became governors of their own muangs, thereby effectively creating principalities throughout Laos.

Fa Ngum's accession as lord of Muang Sua in 1353, with a loyal army of more than 10,000 soldiers, strengthened his position in the area. He managed to entice other muang lords to join with his mandala, which increased his strength in the area. The confederated muangs eventually became the kingdom of Lan Xang.

The new kingdom's first capital was Luang Prabang, located in north-central Laos at the junction of the Mekong and Khan rivers. Despite its initial small size, the nearby kingdoms of Ayutthaya and Sukhothai did not immediately oppose its presence due to their preoccupation with fighting each other over territory. The threatened expansion of the kingdom of Angkor also diverted attention away from the new thriving kingdom. Fa Ngum's reputation grew, especially that of his military prowess. Due to his desire to create a cohesive unified Lao polity kingdom, Fa

➤ FA NGUM

Fa Ngum is an enigmatic historical figure due to our lack of knowledge surrounding his childhood and early adult life, in particular how he grew up in exile within the royal court of Angkor and eventually married a Khmer princess. Leaving the Khmer capital where he spent his childhood, Fa Ngum gathered a huge army of more than 10,000 Khmer and Lao soldiers and fought his way along the Mekong, controlling all the towns he came across. His successful subduing of *muangs* in the middle Mekong area resulted in a substantial increase in the amount of territory under his control, which in turn became the kingdom of Lan Xang.

Fa Ngum became a revered figure, and Lan Xang prospered. Religion was initially an important part of his life; however, the death of his beloved Buddhist wife in 1368 resulted in his total loss of interest in everything concerned with religion and the kingdom. His sudden lack of concern in his royal duties and his questionable actions resulted in his dethronement in 1373 and his subsequent exile to the principality of Nan, a tributary to Lan Xang (in present-day northern Thailand). He died in exile some years later.

—*Samaya Sukha Chanthaphavong*

Ngum expanded it significantly so that in 1359 a golden Buddha (Phra Bang) was received as a gift from the Angkor court in recognition of Fa Ngum's rule.

Laws were enacted so as to further unify Lan Xang and to provide for social, economic, and political stability. Stability in Lan Xang was often precarious in that local lords resented Fa Ngum installing himself as monarch, and his demand for the subordination of all regional power centers to a central mandala created resentments and rifts. The kingdom grew in part from the regular tributary payments collected from surrounding rulers whose trade goods (such as spices and woods) provided much-needed revenue. Slaves and war booty also boosted Lan Xang's revenue.

Lan Xang was a Theravada Buddhist kingdom, influenced by Khmer and Sri Lankan Buddhist principles. Although Buddhism enjoyed

royal patronage, some indigenous animistic beliefs and traditions survived and were incorporated into the sanctioned doctrine so as to appeal to a wider segment of society.

Despite the kingdom's relative success, it suffered constantly from internal pressures and threats. Fa Ngum himself was dethroned in 1373 by his son Unheuan, also known as Samsaenthai (r. 1373–1417). The issue of royal succession was Lan Xang's greatest weakness, as it eroded and habitually weakened the kingdom's political structure. Unheuan's death and that of his son Lan Kham Daeng (r. 1417–1428) created further instability, and an astonishing six kings all died prematurely between 1428 and 1440. During this time the kingdom of Lan Xang was ruled by its only queen, who is referred to as Maha Devi (r. 1428–1442) (Sanskrit translation, mother goddess or great goddess). Maha Devi's identity remains a mystery due to the lack of historical records surrounding her rule; however, many believe that she was Fa Ngum's widow.

Under King Chakhaphat (r. 1442–1479) Lan Xang experienced a somewhat stable political atmosphere. He installed his family in highly sought-after administrative roles in an attempt to stave off any future political crisis. The king, a staunch Buddhist, was also able to strengthen the practice of religion within the kingdom. Despite Lan Xang's increased political strength, it was invaded by the Vietnamese emperor Le Thanh Tong in 1479. Vietnamese forces sacked Luang Prabang and plunged the kingdom into another tumultuous period of instability. In order to defeat Emperor Le's forces, Chakhaphat's son Souvanna Banlang (r. 1479–1485) sought support from the Tai principality of Nan. After successfully retaking Lan Xang, King Banlang died and was quickly replaced by his younger brother, Lasaenthai Puvanart (r. 1486–1496). Upon Puvanart's death, his son Somphu (r. 1496–1501) took the Crown. Since the kingdom's inception in 1353, it was able to enjoy relatively few moments of peace.

The Philippines

Most of the documentation regarding the Philippines between 1000 and 1500 comes from Chinese sources. The first recorded tribute mission from the archipelago to China took place in the first decade of the eleventh century. The mission came from Butuan (Puduan in Chinese) on the northern coast of the island of Mindanao. Butuan is described as a small kingdom farther than Mai (the Philippine island of Mindoro) and east of Champa, a kingdom in southern Vietnam. In addition, the records indicate that Butuan had regular contact with Champa but only rarely with China. One of the purposes of the mission was to request equal status with Champa. The request was denied, but Butuan was in fact a vassal under Champa's authority, which indicates a long-standing relationship between the two entities.

In the middle of the thirteenth century, Zhau Rugua, the superintendent of maritime trade in the province of Fujian, produced a book on the various peoples with whom the Chinese had traded. It should be noted that his work borrowed heavily from Zhou Kufei's handbook of 1178. He correctly located Mai as a place north of Borneo and recorded that the inhabitants lived in large villages of more than 1,000 houses located on opposite banks of streams and rivers. Trading ships would go to specific locations designated for trade. Local leaders were said to use white umbrellas, an Indian symbol of royalty that indicates an earlier Hindu imprint on the archipelago. He also mentioned Balaoyou, now known as the island of Palawan, and a region called Bisheya, which is believed to be the Bisayas in the central Philippines. A century later, Wang

Dayuan published a book after some 20 years of traveling overseas as a trader. He mentioned specific goods from specific locations: pearls from Sulu and forest products from Mindanao.

When the Ming dynasty came to power, emissaries were sent out to invite surrounding kingdoms to send tribute. Luzon is recorded as having responded. Early in the fifteenth century, emissaries were sent out to announce a new emperor. Several kingdoms in the Philippines responded, including Pangasinan (Feng Jiaxian), which sent five tribute missions over the next five years.

It was during this period that Islam came to the Philippines. Although Arab traders had been coming to the archipelago for centuries, it was Chinese Muslim traders along with Arab missionaries who brought Islam to the Philippines, Sulu specifically. Legends have emerged about those who brought the faith to Sulu and the works they performed. The result was a Muslim population with Muslim leaders. But it was a *raja* from Sumatra who is credited with founding the Sulu sultanate in the fifteenth century. Raja Baguinda (*baguinda* means “prince”) from Minangkabau, Sumatra, sailed along with wealthy merchants to Mindanao looking for a Muslim settlement. He and the merchants settled there, and he married a local woman. It was his son-in-law, also from Sumatra, who became the first sultan of Sulu. While Sulu was developing as a wealthy port, the sultan of Brunei established control over the Manila Bay area, bringing the Islamic faith with him. When the Spaniards first visited Manila in 1570, they found Muslim leaders ruling over the area.

All of this information does not tell us anything about the day-to-day lives of the inhabitants of the archipelago. But it does serve to correct any misconceptions of an isolated people without any significant outside contact until the Spanish intrusion.

> A ROYAL TOMB

In 1417 a tribute mission from Sulu, including three leaders along with a retinue of more than 340 persons, left for the Ming capital at Nanjing. According to the Ming annals, the three leaders were the eastern king (of Sulu) Paduka Batara, the western king Maharaja Kolamating, and the mountain king Paduka Prabhu. It should be noted that the titles of these kings have Indian origins: Paduka was a title used in the Hinduized Majapahit empire of eastern Java (ca. 1293–1500) and later by Muslim courts; Maharaja was a Sanskrit title meaning “great king.”

It is clear from the Chinese accounts that these leaders were Muslim. They presented to the emperor a letter of gold engraved with characters and also presented pearls, tortoise shell, and other items. The mission had a dual purpose: for each leader to be recognized as the king of his country and to secure a decision as to who should be given higher status over the other two. The Yongle Emperor chose the eastern king, Paduka Batara of Sulu.

However, before he could return to Sulu, the eastern king died in Shantung Province. The emperor sent an official to perform sacrifices and ordered that the authorities provide the funeral and make arrangements for his tomb. Paduka Batara was buried in Dezhou with elaborate funeral rites and the emperor himself in attendance. Because Paduka Batara was considered royalty, a memorial arch and gateway were built in his honor. The Ming court assigned three Hui (Muslim Chinese) households to help maintain the grave.

The Buddhist Kingdom of Pagan

Pagan (today Bagan), once the capital of the kingdom of Pagan, is situated on the east bank of the Irrawaddy River in central Burma (Myanmar). Once a thriving metropolis extending some 10 miles (16 kilometers) along this bank and covering an area of approximately 25 square miles (65 square kilometers), today Pagan is just one of a

➤ KING KYANZITTHA

Ananda Pagoda at Pagan in present-day Myanmar.
(R. Stanek)

Kyanzittha (r. 1084–1113), who possibly was a younger son of King Anawrahta, seized the throne in 1084, held it for almost three decades, and extended its hegemony by virtue of his military abilities. More than just a soldier, he promoted Pagan's transformation into a premier center of learning and Buddhist art and architecture. Indeed, he is credited with having inaugurated the twelfth-century Golden Age of Burmese temple building. Chief among the architectural masterpieces that he patronized was the Ananda Pagoda (ca. 1105), today the largest and best preserved of the surviving temples from ancient Pagan and one of the finest examples of Southeast Asian Buddhist architecture. The pagoda was severely damaged by an earthquake in 1975 but has been restored.

—Alfred J. Andrea

collection of small villages in the most arid part of central Burma. Some 2,217 registered monuments scattered throughout this area, however, attest to the former splendor of the city of Pagan and the opulence of the kingdom.

The first mention of Pagan in native chronicles dates from the sixth century CE and describes it as a group of 19 villages, each possessing its own *nat* (local spirit). Its inhabitants at the time were the Pyu, a Tibeto-Burman people related to the Burmese who had migrated from the mountains of the north. Apparently the Burmese fol-

lowed the Pyu there at the end of the eighth century and the beginning of the ninth century.

The history of Pagan as a significant polity, however, did not begin until the accession to the throne of Anawrahta (r. 1044–1077), the first historically identifiable king of the dynasty of Pagan. He is noted for increasing the territory of the kingdom, for constructing an irrigation system so that this area became the granary of Upper Burma, and for establishing Theravada Buddhism as the state religion.

Just as Buddhism was declining in India, southern Burma was becoming an increasingly important center for Theravada Buddhist learning, and in 1050, a monk known as Shin Arahan from Thaton, southern Burma's principal city, came to Pagan to convert its people from Mahayana Buddhism, animism, and various Hindu cults to the Theravada sect. He not only won over King Anawrahta to his doctrine but also convinced him that since he had brought no copy of the Tripitaka—the Three Scriptures of Buddhism—with him, the king should request copies of the texts from King Makuta of Thaton. When Makuta refused, Anawrahta invaded his land, and after a three-month siege he captured Thaton, took Makuta captive, and brought back with him not only all of the city's 30 copies of the Tripitaka but also the king's ministers, monks, and a large number of artisans. This was the end of Thaton as a royal city, which never recovered its prosperity; on the other hand, Pagan became the administrative capital and religious center of central and southern Burma.

In spite of some questions about the depth of Anawrahta's religious zeal, he was responsible for the construction of some of the first important Buddhist edifices in Pagan, including Shwe-hsan-daw, the first architecturally developed stupa in Pagan; the Pitaka-taik, a large library meant to house the 30 sets of the Pali Tripitaka; and the Kyauk-ku-ohn-min, a temple provided with chambers for monks to use for meditation. Moreover, the artisans he brought from Thaton possessed the skill needed to undertake other building projects, thereby transforming Pagan into a splendid city.

The building of Buddhist monuments and other structures, as well as the vitality of the kingdom, continued through the reigns of the

next ten kings, but the demise of the dynasty of Pagan and of Pagan as an important political entity coincided with the end of the reign of the tenth successor, Narathihapate (r. 1256–1287). An army sent by Khubilai Khan, Yuan emperor of China, defeated the forces of Narathihapate in 1287, took over the capital, and occupied it for some months. Narathihapate is also known by the name Tarok-phyi (or Tarokpyemin), meaning “he who fled from the Mongols,” because four years earlier, when Khubilai dispatched an army to subdue the kingdom, Narathihapate turned away from battle and fled to the mountains. The king, dejected by this second defeat and forced

to send tribute to Khubilai in order to recover his capital, had to face the scorn of his people for cowardice. His son, taking advantage of the king’s loss of support, had him poisoned. Following Narathihapate’s death, the kingdom fragmented.

■ Introduction: China and Chinese-Influenced East Asia

As it evolved from the era of the Qin dynasty (221–206 BCE) to that of the Tang (618–907) and was later refined under the Song (960–1279) and Ming (1368–1644) dynasties, the Chinese imperial system, which has often been called a Confucian-Legalist hybrid, consisted of the following elements: (1) a centralized state modeled, at least in theory, on China’s core institution, the family; (2) a “father” emperor, known as the Son of Heaven, who was acknowledged as the person who alone maintained harmony not only within the state and society but also between Heaven and Earth; (3) an emperor who maintained this harmony by virtue of his possessing the Mandate of Heaven, a mandate that allowed him to rule as long as he was virtuous and followed the ways of the ancestors; (4) the belief that once that mandate was lost, cosmic forces would bring ruin on his empire, its people, and his dynasty, and the mandate would necessarily pass to a worthy family; (5) an emperor who was served by salaried ministers and officials chosen for their learning, a learning that, in theory, would ensure that they acted virtuously and would serve as the “fathers and mothers” of the people; (6) learned officials who were selected through a rigorous three-tiered system of examinations in the Confucian classics; (7) officials who, once chosen, were

subject to periodic evaluations and potential dismissal; (8) the principle that China, known as the “Central Country” (*Zhongguo*) but translated into English as “the Middle Kingdom,” was not only the center of the Earth but was surrounded by barbarians; (9) the concomitant notion that the Chinese, known as “All under Heaven” (*Tianxia*), were a civilizing influence on these barbarians; and (10) the assumption that it was the duty of barbarians to acknowledge the fatherhood of the Son of Heaven by offering him tribute.

Given China’s early development of governmental theory and structures (far earlier than those of its immediate neighbors), its imperial reach, and the attractiveness of its sophisticated culture, it was natural that its system of government would have some influence on Korea, Japan, Vietnam, and the steppe peoples of eastern Central Asia. The story, however, of how these societies adopted and adapted the Chinese model is a complex one. Many examples can be given, but those of Vietnam, Korea, and Japan suffice to illustrate that there was not just one story line or only one denouement.

Vietnam derived much of its civilization by adapting native ways to cultural influences from India, but that was much more the case for southern Vietnam than northern Vietnam. Northern

Vietnam, a neighbor of China, was periodically pulled into the imperial and cultural grasp of China. Indeed, the Chinese name for this area was Annam, which means “the pacified south.” Due to occupation during the Tang era and imposition on Annam of a Chinese bureaucracy, Chinese forms of government, including the examination system and Confucian orthodoxy, were imposed on Vietnam. Vietnam also received Mahayana Buddhism from China and the Chinese imperial practice of patronizing and closely regulating religion. Although Annam secured its independence from China in the tenth century, under the Li dynasty (1010–1225) Annam maintained a centralized state system based on the Chinese model, complete with a salaried bureaucracy composed of men recruited through an examination system. Subsequent dynasties, namely the Tran (1225–1400) and later the Le (1428–1789), maintained and even expanded upon these Chinese forms of government but also fiercely and successfully resisted invasions by China’s Mongol Yuan dynasty (1279–1368) and by the early Ming dynasty, whose armies were forced to evacuate in 1427. Although Vietnam kept the Chinese at arm’s length, their monarchs continuously sent tribute to the Chinese emperors, and in their official relations with China they tactfully referred to themselves as “kings,” even though they otherwise claimed to be emperors.

Although Da Viet (Great Viet), as they styled their empire, continued to expand southward, Vietnam remained small compared to massive China. One consequence was that its Chinese-style bureaucracy was overly complex and overstaffed relative to the country’s size.

As was the case with Vietnam, Korea’s Silla kingdom (57 BCE–935 CE), which was at its height for a century after its unification of almost the entire peninsula in 668, was deeply influenced by Tang China and became a Chinese tributary state, albeit remaining independent of direct Chinese control. Although Silla attempted to emulate Chinese political institutions, it failed to create an effective bureaucracy, with real power remaining in the hands of aristocratic families. In the tenth and eleventh centuries, however, the new Koryo dynasty (918–1392) created a state structure modeled on China that was to last. It went so far as to lay out Kaesong, its pri-

mary capital city, according to the grid system of Chang’an, Tang China’s primary capital. Like China, the Koryo dynasty also established auxiliary capitals. In 958 it established a Chinese-like civil service examination system, and in order to prepare young men for the examinations, the central government established schools at which the essential Confucian texts were taught.

Conquest by the Mongols in the thirteenth century resulted in Korea being pulled into the orbit of the Mongol empire and particularly of Yuan China. As a consequence, Neo-Confucianism, which later became the new examination matter for Ming China’s civil service examinations, also had a strong impact on Korean education. Under the Yi dynasty (1392–1910) Confucianism flourished, and eventually the Neo-Confucianism of China’s thirteenth-century Zhu Xi School prevailed as the sole orthodoxy in intellectual and political circles. The examination system, modeled on the Ming system, became the primary pathway to status, power, prestige, and wealth for industrious and bright young men from every class.

It is no exaggeration to say that the Yi dynasty adopted Ming Chinese culture and political structures with fervor. For example, in 1395 Yi Korea adopted the Ming criminal code, although it later added native elements and continued its revision down to 1485. If ever there was a model Confucian society, it was Yi Korea.

Japan also avidly borrowed many of the political and social institutions of Tang China during the sixth, seventh, and early eighth centuries, even sending embassies to the Middle Kingdom to learn its ways. Court rituals and ceremonies were largely imitations of those employed by the Chinese, and the entire country was reorganized into provinces modeled on those of China. As was the case in Korea, Nara and Heian (present-day Kyoto), both early imperial capital cities, were laid out in a grid pattern in emulation of Chang’an. Despite this absorption of vast amounts of Chinese influences, there was no effort to create a real bureaucracy as a counterweight to the traditional aristocratic families or to institute an examination system to promote meritorious young men beyond the limits of rigidly divided social classes. Ultimately this meant that centralized political control, if ever achieved in Japan,

would be realized in ways that did not follow those of China.

Beginning in the ninth century, the imperial house came under the control of the Fujiwara clan, instituting a period from 858 to 1160 known as the Fujiwara era. Emperors reigned but did not rule, and the organs of central government withered. As the grip of the Fujiwara loosened, other provincial aristocratic families vied for supreme power, with the Minamoto clan finally winning out in 1185.

Rather than seizing the imperial office for himself, in 1192 Minamoto Yoritomo accepted the title of *shogun*, or “imperial commander in chief,” and elected to rule over a number of military governors from his remote base at Kamakura, while a puppet emperor reigned at Kyoto. This feudal system, known as the *bakufu* (tent headquarters), shaped the politics and culture of Japan for centuries to come. The Kamakura shogunate ended in 1333, but the shogunate system persisted down to 1868, with only two brief periods of interlude.

Although Japan had adopted and adapted to its culture vast elements of Chinese civilization, Chinese political structures were not a successful transplant.

—Alfred J. Andrea

China—The Northern and Southern Song Eras

One of the persistent themes in Chinese politics has been the tension between the centrifugal forces of local autonomy and the centripetal forces of national integration. That this should be so is not surprising in a country that for so long comprehended one-quarter of the world's total population and that lacked until recent times the benefits of modern communications technology. The Song dynasty (960–1279) conformed to this pattern as well. The Song followed a long period of political decentralization and military conflict in the late Tang dynasty and during the early tenth century, and for that reason its leaders tended to favor integration over autonomy.

That fear of fragmentation gave rise to the two main characteristics of politics during the Song dynasty: a greater emphasis on civilian

➤ EMPEROR HUIZONG

Emperor Huizong (r. 1100–1126) was as blessed with prodigious artistic talents as he was cursed with poor political judgment. On the one hand, he was a gifted calligrapher and painter in his own right, a connoisseur of exquisite taste who was also deeply interested in Daoist philosophy. On the other hand, he had the misfortune to rule when the qualities of leadership demanded by the circumstances of the time were utterly different than his own. His government presided over a series of ill-conceived and poorly executed decisions in foreign policy that ultimately led to his abdication in 1126 and then to the defeat of the Northern Song dynasty by the invading Jin dynasty in 1127. In the aftermath of that defeat, Huizong himself was captured and spent the rest of his life in captivity in the forests of Heilongjiang in Manchuria, eventually dying in 1135. Although later Chinese historians—who felt compelled to give a moralistic explanation for the military weakness of the dynasty—castigated him as having squandered the resources of the state in extravagant gardens and expensive living while the empire collapsed around him, his true legacy is more complex. He was also responsible for policies that were designed to foster public education and health as well as social welfare for the poor.

—Alan Wood

Once one of at least 2,000 mud-walled forts built by the Northern Song dynasty (960–1126) along its northern frontier to contain the XiXia empire, today this structure serves as a farmer's garden. (Alfred J. Andrea)

rather than military power and a gradual process of centralizing power into the hands of the emperor and his immediate staff. In pursuit of the former goal, the early emperors of the Song professionalized the officer corps and put them under the control of civilian bureaucrats. The Song emperors also stationed the best troops in the capital, rotated commanders more frequently than before, centralized promotions, and shifted revenue collecting to civilian agencies. The curtailing of the military was matched by an equivalent revival of civilian administration. The examination system for civilian officials was reinstated, with the result that the average number of top degrees (*jinsbi*) conferred between 1020 and 1057 was higher than at any other comparable time in Chinese history. The examination system became in the Song one of the most important institutional forces for unity in Chinese politics by creating a common language of thought and discourse throughout all of China. Social, economic, political, cultural, and philosophical integration was fostered by a shared

curriculum and a single avenue to power and prestige.

Centralization of power was also enhanced by early emperors who appropriated the powers formerly given to the prime minister and brought them under the direct control of the emperor and his palace staff. The emperor also developed a spy system operated out of the palace to ensure that he had alternative sources of information outside the normal bureaucratic channels. In general, the period of the Song dynasty is unquestionably one of the high points of good government in all of Chinese history. The quality of leadership, in terms of both the emperors and the public officials, was very high. There were two major lapses in an otherwise positive appraisal. The first occurred in the second half of the eleventh century, when the civilian bureaucracy was riven by disputes between two factions of officials, both motivated by high ideals but each unwilling to compromise with the other. The second lapse, far more serious to the politics of the whole, was the failure to de-

fend the northern borders against attacks by central Asian peoples, which eventually resulted in the loss of the north to the Jin dynasty in 1127. The Song court was forced to retreat south and reestablish a new capital in Hangzhou, where it remained for another century and a half until both the Jin and the Song were defeated by the Mongols in the thirteenth century.

In the Southern Song, the orientation of the political elite shifted inward from a preoccupation with national politics to a new focus on local affairs. Instead of working toward reform from the top down, at the level of the central government, the Southern Song scholar-elite sought to build institutions at the local level that would reform the state from the bottom up (or from the inside out, starting with self-cultivation and then moving to the family and the local community). They committed themselves to supporting charitable estates, schools and academies, community granaries, and community compacts, all of which were devoted to social welfare but outside the formal institutions of state control.

If the civilian orientation of government during the Song can be seen as a great strength, it can also be seen as a great weakness. Failure to maintain an effective military force made the Song vulnerable to attack by Central Asian peoples who had ready access to horses and who were far more skilled in the military arts. In addition, the Southern Song government made the mistake of allying with the Mongols in order to defeat their former enemy, the Jin, only to discover—too late—that the Mongols had no intention of stopping their conquest with northern China. They wanted the south as well, and they even learned how to conduct a naval campaign in order to defeat the Song navy. By 1279 the conflict was over and the Southern Song had ceased to exist, putting an end to one of the most prosperous, well-governed, and culturally rich periods in all of Chinese history.

XiXia

What is known of the Tanguts, rulers of the Xia, or XiXia, dynasty (1038–1227) who carved out a state in lands that lay largely northwest of the Yellow River, comes primarily from Chinese records. Although the Xia dynasty can be delineated on a map, it remains obscure even though the Tanguts developed their own writing system in 1036. Religious texts and other documents exist, including those held by the British Museum. The script, which includes 6,000 ideograms similar to Chinese-type characters, was used to translate Chinese texts and record Buddhist songs and rituals, but it is considered one of the most difficult languages in the world. Hence, the Tanguts have yet to find their voice in the modern era

Tomb of an unknown XiXia emperor. Located at the foot of the Helan Mountains, the XiXia mausoleum complex covers 33 square miles (53 square kilometers) and includes nine imperial tombs, along with 253 other funerary sites. The Mongols desecrated and pillaged these tombs in 1227. (Alfred J. Andrea)

➤ WHO WERE THE TANGUTS?

The Tanguts were a non-Chinese ethnic group related to the Tibetans with whom they shared a language group. In the ninth century these nomadic people, who herded for a living, left their homeland in the Tibetan highlands as the Tibetan empire disintegrated into numerous small political units. The Tanguts settled in that region of China and Mongolia that earlier had been controlled by China's Tang dynasty (618–907). Part of the land they occupied was what is today China's Gansu Province, where they left their imprint as patrons of Buddhist devotion and art at such Silk Road sites as the Mogao Caves at Dunhuang. With their capital, Xingqing (present-day Yinchuan, the capital of China's Ningxia Hui Autonomous Region), located on the Yellow River, the Tanguts were poised to take advantage of their location astride trade routes that linked Mongolia, China, and Central Asian lands to the west. Soon they controlled the lucrative horse trade business with China.

—Tracy Lee Steele

and will not until linguists agree on translations of their puzzling script.

The Tanguts migrated in the ninth century to what is today part of northwestern China. Dramatic changes were made under the leadership of Yuanhao (r. 1032–1048). Yuanhao proclaimed himself Tangut emperor in 1038 and declared independence for Da Xia (Great Xia), the Chinese name for the Tangut empire. This dramatic shift was quickly followed by Yuanhao's demand, copied from the actions of the Khitan (Qidan) Liao dynasty (907–1125), which had carved out an empire to the Tanguts' northeast, that the Song rulers of China recognize him as their equal. The Song, however, refused to recognize the Tangut ruler as an equal as well as Yuanhao's counteroffer to call the Song emperor his father. The Song agreed that the Tanguts could use the title "ruler," which was considered to be higher than king but lower than emperor. The Tanguts agreed on the condition that the Song pay them an annual subsidy. Hence, the Song were forced to make tribute payments to the Tanguts, now known to the Chinese as the

XiXia, or the Western Xia dynasty, as a way of indicating their geographic position in relation to the Song. Despite this success with the Song, a year later the Xia ruler was forced to acknowledge the superiority of the Liao empire, to which the Tanguts in turn paid tribute.

Like the Liao, the Tanguts drew on Chinese models for a variety of governmental needs, including adopting China's style of foreign policy (such as tribute relations), its imperial titles, and elements of Confucian statecraft, as evidenced by the translation of key Chinese texts. The Tanguts even copied Chinese styles for royal tombs. Like other nonethnic Chinese governments, they often employed Chinese officials and ruled ethnic Han Chinese peasants and merchants who lived in Xia territory. They also borrowed from their non-Chinese neighbors, particularly the Liao, whose policies toward the Song they often mimicked. In terms of religion, the Tanguts were devout members of a Tantric Buddhist sect, as were the Tibetans, Liao, and the Jurchen (Ruzhen).

In 1125 the Liao succumbed to the Jin dynasty (1115–1234) that had been founded by the Jurchen, who originated in Manchuria. In turn, the Jin dynasty came under attack by the Mongols. This left the Xia in a delicate position regarding the Mongols, with whom they allied in 1209 to help Chinggis Khan in his campaign against the Jin empire. Interestingly, the Tanguts, as non-Chinese Mongol allies similar to the Persians, were classified for taxation and other purposes higher than the Chinese, Khitan, or Jurchen by the Mongols. Despite this, the Xia took advantage of Chinggis's preoccupation with other campaigns by seeking alliances with the Song and the surviving Jin. In 1226 Chinggis Khan returned to the Xia homeland bent on its destruction. The Xia capital held out for five months, during which time Chinggis died, but the Mongols kept this secret. Ultimately the Xia surrendered, and their leader was hacked to death. The Tanguts, who had angered the Mongols by performing better than expected on the battlefield, were annihilated in 1127.

Liao and Jin States of Northern China

With the collapse of the Tang dynasty in 907, China entered a long period of trouble. Northern China, a major cradle of Chinese civilization, was progressively overrun by several non-Han nomadic forces over the next four and a half centuries. In order to govern a large polyethnic society in the north and rival the Han Chinese in the south, all of these "barbaric" peoples founded imperial states modeled on previous Chinese dynasties. The states of Liao and Jin were two remarkable examples.

The Khitan (Qidan), a pastoral seminomadic people out of Mongolia and Manchuria, were originally subjects of the Tang dynasty. When the Tang dynasty passed away, the Khitans gained their independence, with Yelu Abaoji as their great khan. Following the Chinese dynastic tradition, they later named their state Great Liao (also known as Liao, 907–1125), with Abaoji thus becoming the founding emperor of a new dynasty.

Abaoji was a military and administrative genius. He successfully united all the Khitan tribes and organized them into effective fighting units, and Khitan warriors then embarked on a vigorous campaign to conquer several dozen nomadic and sedentary peoples on their borders. To manage this diversified new empire, Liao officials created a dual governing system: the northern government, based on a tribal structure, ruled over nomadic and seminomadic peoples; the southern government, modeled on the traditional Chinese bureaucracy, controlled the Chinese whom they had conquered.

When the Song dynasty was founded in 960 in China's heartland, the Khitans invaded repeatedly. Wars between Liao and Song lasted for over 25 years and finally ended with the signing of

The Pagoda of 10,000 Sutras, an octagonal, seven-story Buddhist structure constructed by the Qidan (Khitan) Mongols of the Liao Empire around the eleventh century. (Alfred J. Andrea)

the Treaty of Chanyuan Zhi Meng in 1005. The treaty stipulated that Liao and Song were equal brothers, but Brother Song must pay to Brother Liao an annual "gift" in silver and silk. The treaty put the Sinocentric world order completely upside down: the "civilized" Chinese now had to pay the "barbaric" steppe people and respect them as equals.

In 1125 the Liao dynasty was overthrown by one of its subordinate tribal leaders named Wanyan Aguda. Aguda was from a warlike ethnic minority group known as the Jurchen (Ruzhen, or Nuzhen, in Pinyin). In the Liao dynasty, the Jurchens were cruelly exploited and discriminated against by the Khitan rulers. In 1115 Aguda unified the whole Jurchen tribe and raised a rebellion against the Liao by declaring the founding of a new dynasty known as Jin (Golden, 1115–1234) in Manchuria. The Jurchens won brilliant victories against a much larger Liao army and later against the much wealthier army of the Song dynasty. After the Liao capitulation, the Jurchens moved their capital from Manchuria to

➤ AGUDA AT THE FIRST-FISH FEAST

It was customary for a Liao emperor to go ice fishing in the Songhua River early each spring. After fishing, he would enjoy a feast and collect tribute from the local Jurchen tribal leaders. Overburdened Jurchens hated it, but they were too frightened to challenge the emperor.

One early spring morning in 1112 the Liao emperor Tianzuo arrived at the Songhua River. As a matter of long-standing practice, all Jurchen chieftains gathered in Tianzuo's house with their gifts for the emperor and freshly caught fish for his "first fish" feast. The fish was delicious, and Emperor Tianzuo was having a great time. When he was about half drunk he suddenly stood up and commanded the Jurchen chieftains to arise and dance.

Jurchens always believed it degrading and humiliating for a man to dance in public to entertain anyone, even an emperor. However, the chieftains knew only too well that they must meekly obey the emperor. They stood up and danced, one after the other. Only Aguda refused. He was repeatedly pressed to do so but in the end was adamant in refusing.

Emperor Tianzuo was furious and wanted him executed. Aguda narrowly escaped and two years later started rebelling against the emperor. In 1115 Aguda proclaimed the founding of Jin, and in 1125 Emperor Tianzuo was captured.

—Liangwu Yin

Yanjing (now Beijing) and then to Bian (now Kaifeng) after driving away the Song from northern China. The Jurchens gradually incorporated the vast areas into their empire that extended from the Sea of Japan to the Yellow River, with the weak Southern Song and XiXia states made into tributaries. The Jin dynasty prospered for over a century before it fell victim to the joint assaults launched by Mongols and Chinese in 1234.

Like the Liao dynasty, the Jin adopted a dual administration to govern the Han Chinese and tribal peoples separately. Also like the Khitans, the Jurchens made a conscious effort to retain their cultural, ethnic, and linguistic identities. They chose not to use written Chinese and developed their own script, derived from Khitan script that had been modeled on classic Chinese

script but separate from it, for their language. However, the Han Chinese sedentary lifestyle proved too comfortable to ignore. Gradually they modified their economic and social attitudes by engaging in agricultural and manufacturing production. Their warrior spirit also gradually disappeared, and the ethnic identity of those Jurchens who resided within the traditional heartland of China became blurred. Liao-Khitans, Jin-Jurchens, and Han Chinese all eventually became members of one entity in northern China.

China—The Yuan Era, 1260–1368

The Yuan dynasty, which presided over an era of Mongol rule in China, was officially named in 1271. Yuan derived from *Da Yuan* (Great Origin), a term from the *Yijing* (*I Ching*), or *Book of Changes*. This was suggested by a Chinese adviser to Khubilai Khan (r. 1260–1294), Chinggis Khan's grandson, who had been acclaimed Great Khan in 1260 and escalated the Mongols' campaigns against the Song dynasty, which was eradicated in 1279. Khubilai, who assumed the Chinese throne name Shizu, also transferred the Mongol capital from Karakorum in Mongolia to the area of present-day Beijing in 1264. He established his new city, Dadu, just slightly northeast of the former Jin dynasty (1126–1234) capital of Zhongdu (Central Capital).

➤ KHUBILAI KHAN

Khubilai Khan, from a Chinese engraving. The grandson of Chinggis Khan, Khubilai firmly established the Mongol-Chinese Yuan dynasty. (Library of Congress)

Khubilai Khan was born on September 23, 1215, the same year that his grandfather Chinggis Khan captured the Jin capital, Zhongdu. His mother, Sorghaghtani Beki, saw that all her sons were educated, and Khubilai was literate in Mongol but not in Chinese. His father was passed over as khan, and Khubilai himself remained in the background until after

the death of his uncle Ogedai in 1241. Khubilai's brother Mongke became khan in 1251. Meanwhile, Khubilai consolidated his own power in northern China around his appanage of Xingzhao, and he was given two other territories, Jingzhao and Huaimeng. He promoted trade in his territories by printing paper money, and he established offices to maintain the peace. In 1252 Mongke Khan ordered him to take the rebellious southern territory of Dali, which Khubilai successfully brought under Mongol control.

In 1259 Mongke died, and Khubilai was made Great Khan in 1260, ruling until his death in 1294. He drew his advisers from a variety of ethnic and

religious groups including Uighurs, Chinese, Tibetans, Confucians, Assyrian (Nestorian) Christians, Muslims, Buddhists, Latin Christians, and many others. But his most important and trusted adviser was his wife Chabi, whom he consulted on most of his decisions.

Khubilai continued to fight to bring the remainder of China under Mongol control, but the subjugation of the Song dynasty was not completed until 1279. Unlike his predecessors, Khubilai conquered the Chinese with a minimum of destruction. Landowners retained their estates, and local institutions were left mostly undisturbed. Once China was pacified, Khubilai turned his face to the east, with two disastrous attempts to conquer Japan in 1274 and 1281. His expeditions into Southeast Asia were also less than successful, although he was able to conquer Nan-Chao (present-day Yunnan), which became a permanent part of China.

Khubilai was a Buddhist and embraced the Lamanistic, Tantric traditions of Tibet. He ordered his Buddhist adviser, the lama Phags-pa, to create a new alphabet for the Mongols to replace the former Uighur-influenced one. Known as Phangs-pa, it became the official script and was compulsory on government documents after 1269.

After the death of his wife Chabi, Khubilai became deeply depressed. He became increasingly fat and consumed large amounts of alcohol. He died in 1294, beset by gout and numerous other ailments.

—Rebecca Wendelken

Under Mongol rule, China was divided into a number of largely autonomous regions that were given to Mongol generals and nobles who controlled them in the name of the Great Khan. Decentralized government meant that direct Mongol rule was generally felt only in the region around the capital and in a few of their non-Chinese holdings. The other regions maintained a loose relationship with the capital through a Chinese-style bureaucratic administration. The most powerful of the bureaus was the Censorate, which divided the empire into three districts and through its investigative powers kept ruling nobles and generals in check. This helped to overcome some of the problems associated with a

decentralized and loosely constructed governmental structure. The Yuan emperor was also the final court of judicial appeal.

The Yuan emperor maintained a monopoly on the appointment and dismissal of officials, reserving the highest posts for non-Chinese. The Mongols also divided the population of China into four classes. At the top were the Mongols. Next were Western and Central Asians, followed by the former subjects of the Jin empire of northern China. At the bottom were the subjects of the former Song dynasty: namely, the Han Chinese. Needless to say, the Mongols distanced themselves from their Chinese subjects. Mongols were discouraged from marrying Chinese

women, and Khubilai took only Mongol women into his palace. The Chinese were kept in their place by laws that limited their freedom. For example, they were forbidden to gather in public or to own weapons. When the civil service examinations were reinstituted in 1315, three-quarters of the degrees were reserved for non-Chinese, with fully half going to Mongols and other Central Asians and another quarter to the former subjects of the Jin empire.

Because of such harsh restrictions, it was once assumed that Mongol rule forced Chinese culture and civilization underground. More recent studies have shown that this was not the entirely the case. Chinese writers may well have had more freedom of expression. Lack of control in the provinces due to decentralized government opened a door for more literary freedom. Because Chinese literati were largely banned from higher governmental positions, many had a greater opportunity to engage in literary pursuits. Landscape painting, another pastime of the literati, also blossomed. Drama, which had its origins as a Chinese art form in the Jin empire, also flourished, and its themes were sometimes subtly anti-Mongol. Since few Mongols spoke or read Chinese, writers and dramatists were relatively safe. At the same time, the Mongol rulers were avid patrons of the theater.

An important aspect of the Yuan dynasty for the future history of China was its role in reuniting northern and southern China under one rule. Northern China had been under foreign rule for nearly 300 years by steppe peoples such as the Jurchens (Jin empire). In the intervening period China's two halves had begun to grow apart culturally and politically. Moreover, China experienced a relatively favorable economic environment under the Mongols. The Grand Canal was repaired and reopened and helped to unite the North and South economically. International trade, especially seaborne commerce, flourished, and goods from throughout Asia and beyond were brought to China for trade. The Mongols maintained a communication system, the *yam*, that connected the various Mongol holdings. Many travelers from Europe are known to have visited Yuan China, including Marco Polo, Odoric of Pordenone, and John of Marignolli.

However, taxation under the Mongols was high, and inflation also became a major problem. Adding to its economic woes was a major population decrease during the Yuan era, in large part occasioned by early Mongol devastations, subsequent epidemics, and other natural disasters. The combined Jin and Southern Song populations were around 120 million in 1207; by 1290 the registered population of all of China was around 60 million, and it stayed at that level for about a century. Needless to say, for all of these reasons there was a good deal of anti-Mongol sentiment in China. Certainly the anti-Mongol plays point to festering hatred. Despite this sentiment, other Chinese copied Mongol dress and names, perhaps to curry favor.

At his death, Khubilai Khan was succeeded as Great Khan by his grandson Temur Oljeitu, but neither Temur nor any of the subsequent Yuan emperors ever reached Khubilai's skill in leadership. The situation grew even worse after the assassination of Emperor Shidebala in 1323. The last Yuan emperor, Toghon Temur, took the throne in 1333 at the age of 13. His reign was marked by natural disasters, economic difficulties, and peasant uprisings, sure signs of the loss of Heaven's favor and mandate to rule. The Yellow River flooded repeatedly, and there were numerous plagues. Poor harvests and disease triggered peasant uprisings in the South which were supported by the White Lotus, a secret Buddhist society. These uprisings disrupted the rice trade, causing food prices to rise. The government attempted to compensate by printing more money, but this only increased the amount of inflation.

During the last years of the Yuan dynasty, the Mongols fell to infighting, and power was held not by the emperor but rather by warlords. Some Mongols blamed the dynasty's decline on Sinitic influence, arguing that the Mongols in China were becoming too Chinese and thus increasingly weak. Mongols in Mongolia rebelled against edicts coming from Dadu. In 1368 Toghon Temur was driven out of the capital by Zhu Yuanzhang, later known as Taizu and also as the Hongwu emperor, the founder of the Ming dynasty. Toghon Temur fled to Karakorum, where he died two years later.

Early Ming and Its Frontiers— From Nanjing to Beijing

After expelling the Mongols from China in 1368, the nascent Ming empire (1368–1644) now had to consider its borders. The largest threat came from the north. Although the Mongols had been defeated, by no means were they weak. In addition, the Ming had an expanding population. The rebellion against the Mongols, along with the general poor administration during the waning years of the Yuan dynasty, displaced numerous peasants. Ming efforts to bring these individuals back into Chinese society and government control led to an expansion of the frontier.

Originally the Ming capital was far from the modern Beijing, located at the port city of Nanjing (Southern Capital) on the Yangzi River. Even before the official shift of the capital to Beijing, the Hongwu emperor (r. 1368–1398) was concerned with Nanjing as the capital, as no dynasty with its primary capital based in the south had successfully controlled all regions of China. A site in the north seemed more ideal, especially with the ever-present Mongol threat. However, as time passed, the Hongwu emperor settled on Nanjing and focused on consolidating his empire, leaving the conundrum of a suitable northern capital to his successors.

In 1421, the Yongle emperor (r. 1403–1425) shifted the capital to Beijing (Northern Capital). The site was selected for a variety of reasons.

One was the Hongwu emperor's earlier concern that only dynasties with a capital in the north successfully ruled all of China. Although the weight and consideration of tradition and history always have had an impact on monumental decisions in China, pragmatism also played its role. The Yongle emperor was increasingly focusing his attention on the Inner Asian frontier. With the rise of the Oirats and continued Mongol raids, Nanjing was simply not a suitable location for directing defenses and campaigns.

The site also had some symbolic importance, as it was formerly the Jin and Yuan capitals as well. Thus, the Yongle emperor not only rebuilt its Yuan walls but also replicated his Nanjing palace there, but in a far greater dimension. Construction began in 1407 and ultimately yielded a much larger city than that of the Yuan period but also created cities within the city. The territory contained in the outer city walls formed the imperial city (*buangcheng*), while a second set of walls and a moat demarcated the palace city (*zijincheng*). Located in the *zijincheng* were residences of several of the Ming princes and other nobles, and the emperor's palace resided in another section. This final layer was what is known as the Forbidden City, which housed the imperial household and immediate attendants.

With a new capital, the Ming now could deal with threats from Inner Asia more effectively. Being closer to the frontier did not resolve all of the issues, but Beijing's proximity eased some logistical, diplomatic, and military problems. Initially the Ming took the battle to the Mongols; however, Mongol attacks between 1483 and 1489 thwarted further efforts. After this, the Ming could only defend their frontiers. Indeed, the Mongol threat necessitated the Ming maintaining approximately 1 million men to defend the northern frontier. In addition, to prevent or at least impede further Mongol attacks, the Ming improved and extended existing walls and fortifications along the northern frontier and, more importantly, constructed a series of new ones during the late fifteenth and sixteenth centuries. These massive defensive barriers collectively constitute the bulk of what today is misleadingly known as the Great Wall. Even at its full extent and strength, the Great Wall never spanned the entire northern frontier.

Contrary to popular opinion, the Great Wall of China is not a single, unbroken wall. Although frontier forts predated the unification of China in 221 BCE, and the Qin and subsequent dynasties connected and expanded portions of these frontier barriers, it was not until the era of the early Ming dynasty that the massive walls tourists visit today were constructed. This is a rebuilt portion of that Ming wall, reconstructed a few years ago. (Corel)

Consequently, it was never an absolute barrier, as the Mongols tended to find gaps. Moreover, the Mongols were even often able to penetrate places where its imposing walls stood guard simply by recourse to such tactics as bribery or cutting off and storming isolated posts. Nonetheless the wall served its purpose, as it slowed Mongol raids and brought part of the frontier under Chinese influence, allowing the Ming to interject themselves diplomatically and economically, if not militarily, into the steppe.

A more serious threat came from another nomadic people on China's northwest frontier: the Oirats, or Western Mongols. The Yongle emperor had prevented the Oirats from coalescing into a major force, but that situation quickly changed upon his demise in 1425. The Oirats did not attempt to revive the Yuan dynasty, nor did they necessarily recognize that their ruler had to be a descendent of Chinggis Khan. Nonetheless, they raided the borders of China incessantly and proved to be a dangerous threat by capturing the Zhengtong emperor (r. 1436–1449, 1457–1464) after defeating Ming forces in 1449 near Beijing. Fortunately for the Ming, the Khalkha, or Eastern Mongols, also viewed the Oirats as a threat, and their internecine fighting spared China potential conquest from either source.

China—The Early Ming Era, 1368–circa 1500

Sandwiched between two of the mightiest cosmopolitan regimes in East Asian history, China's Ming dynasty (1368–1644), the name of which (*Da Ming*) translates as “Great Brightness,” has for too long been relegated to obscurity by historians. When compared with the two alien regimes—the vast Eurasian empire of the Mongols that preceded it and the Manchu Qing colossus that followed—the Ming has appeared less significant, less accomplished, more introverted, defensive, some say xenophobic, and lackluster than the two non-Chinese regimes. Nevertheless, as research into this last native-Chinese dynasty grows, appreciation for the importance of Ming China in world history increases.

The appearance of the Ming dynasty marked a significant turning point in Eurasian, as well as Chinese, history. It put an end to the Mongol Yuan dynasty's much resented, nearly century-long military occupation of China and restored Chinese governance to parts of northern China that had known nothing but alien rule for more than four centuries. Furthermore, a now-reunified China under native rule was neither a mere restoration of the Song (960–1279) nor insignificant in size. At over 1.5 million square miles (nearly 4 million square kilometers), Ming territory rivaled the Tang empire (618–907) in some respects and was larger than the Song, both glorious Chinese dynasties that the Ming dynasty claimed as its ancestors. With a dense and productive population of between 60 and 80 million at its founding, China's Ming population rebounded sharply

under the early Ming after a steep decline during the era of Mongol invasions and occupation. With the fragmentation of the Mongol empire, China again became the most populous country on earth, and by its end likely contained a fourth of the world's total population. Due to 277 years of relative stability, growth, and prosperity, the population seems to have doubled to at least 150 million by 1600. By 1500, the Ming was already beginning a dramatic commercial expansion that would take its products to the far corners of the Afro-Eurasian world.

The restoration of native rule to a reunified China aspiring to reclaim its position as an East Asian powerhouse resulted from the dramatic rise to power of the rebel leader Zhu Yuanzhang (1328–1398), one of the most influential figures in Chinese history. Once he dispelled the Mongols back to their homeland, he immediately shaped the new regime according to his vision of what China could be and needed to become.

Adopting the reign title Hongwu (Abundantly Martial), the new emperor (r. 1368–1398)

imposed strict law and order in equal measure. His means were the threat and application of physical coercion and a major re-codification of the law, *The Ming Code*, which was amplified by many supplements, administrative regulations, and imperial pronouncements and was posted even in remote villages. All was designed to promote obedience and reinvigorate centralized government by invoking Tang and Song precedents, imposing Neo-Confucian orthodoxy, and eventually restoring civil service exams based on merit. His suspicion of intellectuals and bureaucrats, however, led him to abolish the office of chancellor or prime minister, in existence since the Han dynasty (202 BCE–220 CE). This meant a less centralized bureaucracy, one on which the emperor could impose his will directly, but such attention to the detailed workings of so many government ministries and agencies mightily increased the emperor's workload. Few subsequent rulers were as obsessive, and most left the work either to palace eunuchs or to secretaries recruited from officialdom. The result was

► THE YONGLE EMPEROR

The Yongle emperor (b. 1360, r. 1403–1424), third ruler of China's Ming dynasty (1368–1644), was one of the most capable and audacious in Chinese history. By constructing Beijing's best-known monuments and demonstrating China's power through unprecedented maritime expansion, he left an enduring mark on Chinese and world history. However, from a Confucian perspective, he was a very unfilial son.

Born the fourth son of Ming founder Zhu Yuanzhang, the future Yongle emperor (personal name Zhu Di) was never in line for the throne. Upon maturity Zhu Di was made the Prince of Yan and was sent to Beiping (Northern Peace) to protect the empire's northern border against the Mongols. On this strategic frontier, Zhu Di's military prowess and political ambitions grew, despite his father's constraints. When the emperor died in 1398 leaving a teenage grandson, Jianwen (r. 1399–1402), on the throne, Zhu Di employed his military advantage to usurp power from his nephew. During the ensuing civil war the nephew died in a palace fire. A bloody purge of the emperor's loyalists followed.

Adopting the reign title of Yongle (Everlasting Happiness), the new ruler ignored his father's dynastic intentions and remade the empire to his own liking. Foremost, in 1421 he relocated the

capital from Nanjing to the north, renaming his home base Beijing (Northern Capital). There he built a new dynastic capital more glorious than his father's. He supervised the building of Beijing's monumental walls and gates, its sprawling Forbidden City, and its awe-inspiring Temple of Heaven. Even in preparing his final resting place, Zhu Di constructed on the outskirts of Beijing a tomb (still unexcavated) more grandiose than his father's in Nanjing.

With similar zeal, Zhu Di spread China's influence, at least for a time, well beyond its borders, personally leading five military campaigns into Mongolia (dying while on the fifth) and, most astonishingly, launching Admiral Zheng He's voyages to Southeast Asia, the Indian Ocean, the Persian Gulf, the Red Sea, and the shores of East Africa. An exceptional Ming ruler, Zhu Di showed an adventurous spirit and dynamism in foreign affairs but did little to diminish imperial despotism at home. On the contrary, he created a supra-bureaucratic force of eunuch henchmen and spies whose periodic excesses and interference in the functioning of government remained one of the Ming's most persistent and debilitating weaknesses.

—*Roland L. Higgins*

mutual distrust, hostility, and competition between the two groups vying for the emperor's attention, and frequently these deep divisions evolved into political struggles that ended badly. Still, no one dared reverse the founder's decision in this or many other matters.

Some observers see the legacy of Mongol rule influencing the Hongwu emperor's tyrannical behavior, his harshness, physical brutality, elimination of suspected rivals, wholesale bureaucratic purges, and generally autocratic governing style, because these lacked any precedent in Song times. Yet that is only part of the answer. The desperate times in which Zhu lived and the ruthless methods required in his rise to power certainly shaped his attitudes about governing. Furthermore, while still authoritarian, most subsequent Ming emperors either lacked the will,

disposition, and energy or were too preoccupied with their own problems, pastimes, and palace intrigues to replicate the dynastic founder's excesses to such savage degrees. Also, Confucian officials strived constantly to corral disruptive rulers. To take a broader perspective, global historians have identified a number of other countries, from Russia to Japan and Vietnam, that underwent a heightened sense of ethnic distinctiveness and an urgent impetus to (re)centralize their regimes in the immediate post-Mongol aftermath.

Even though the Hongwu emperor planned for an orderly succession and had groomed his eldest son to carry on, when the latter died, the emperor bypassed other sons and chose a grandson, who assumed power in 1399. Offended and indignant at this snub, the most ambitious and

powerful of the young emperor's princely uncles, Zhu Di, moved south with an army from his stronghold in present-day Beijing and overthrew his nephew. With this act of usurpation, the second most extraordinary reign in Ming times began. Under the reign title Yongle (r. 1403–1424), Zhu Di's every action seemed calculated to affirm the legitimacy of his claim to rule and to enhance the glory of his empire. He reoriented the empire by shifting the primary capital from Nanjing (Southern Capital) to his powerbase in the north in 1421, the former, now-razed Mongol capital of Dadu, which he rebuilt into Beijing (Northern Capital). Here he could keep an eye on Mongol activity and northern defenses. By 1500, Beijing, which remained the capital of China with scant interruption to the present, was well on its way to becoming the world's greatest city and continued to be well into modern times.

In foreign affairs, the Yongle emperor, mindful of Khubilai Khan's example, ignored his father's admonitions and took a more expansionist approach by attempting to extend the empire's borders and to project Ming power to distant lands. More successfully than Khubilai, he annexed Vietnam in 1407 (although the occupation ended after two decades) and personally led five military campaigns into Mongolia. Although disappointed in failing to achieve a decisive victory over the Mongols or a means to integrate the steppe lands into his empire, the Yongle emperor nonetheless compensated in part by vigorously restoring the Chinese Tributary System, and in this he was abundantly successful. One of the main purposes of launching the diplomatic and commercial voyages of his trusted eunuch Admiral Zheng He was the opportunity to herald the restoration of Chinese power and the Son of Heaven's prestige throughout the maritime world from the East China Sea, through the Indian Ocean, to East Africa. This was truly an unprecedented feat for any monarch, Chinese, Mongol, or other. Dozens of countries responded favorably by sending tributary missions to China.

At the time, the Indian Ocean operated as the principal crossroads for extensive Afro-Eurasian maritime trading networks. The dramatic arrival of the awe-inspiring Chinese fleets demonstrated the preeminence of China in such areas as shipbuilding technology, carrying capacity, long-

distance navigation and communications, and state sponsorship of large-scale maritime enterprises, as well as the projection of diplomatic and potentially military clout. It was an impressive display of Chinese know-how, and it must have pleased the Yongle emperor to accomplish things the Mongols only dreamed of; their maritime ventures had all failed. Although these large-scale voyages did end after the emperor's death, one important legacy of Zheng He's voyages was the restoration of contacts and the rebuilding of linkages between overseas Chinese trading communities, especially in Southeast Asia and the homeland. It had been an open invitation for Chinese merchants to resume business as before, and that is what they did.

Too much has been made of the precipitous end of the early Ming state-sponsored voyages in 1433, and frequent statements regarding China's subsequent "isolation" and "turning inward" are exaggerated. After 1433, but well before 1500, there is evidence of persisting overseas contact, maritime trade, coastal smuggling, pirate activity, and private shipbuilding, all suggesting official bans against these activities had little impact at the local level along China's southeast littoral. This trend only continued to grow after 1500 and contributed to the Ming's sixteenth-century commercial expansion, generated in part by the export overseas of its manufactures, especially silk, the Ming period's famous blue and white porcelains, and many other luxury items, as well as products for practical use. Furthermore, throughout the period, besides the clandestine trade at Quanzhou, for example, legitimate and recognized tributary missions from overseas countries continued to arrive in such designated ports as Ningbo, Fuzhou, and Guangzhou. In addition, even though Mongol raids on the northern border did recur from time to time, long periods of mutually beneficial trade, the "tea-horse" trade, did take place there as well.

After Zhu Yuanzhang and Zhu Di, whose dynamic reigns did so much to mold a dynasty they hoped would endure for ten thousand years, the second half of the early Ming era witnessed a succession of younger, weaker emperors, who often ended up mired in palace politics and intrigues. Their reigns, with one or two exceptions, are marked by eunuchs' abuses of power,

corruption, bureaucratic timidity, and political factionalism. In one rare, but misguided burst of enthusiasm, a naïve emperor in 1449 led an abortive military campaign into Mongolia and ended up ambushed (at Tumu), with his army slaughtered and himself taken captive. Soon after this humiliation, the rebuilding and reinforcing of the Great Wall was resumed in earnest.

Despite its vicissitudes, by 1500, the Ming dynasty had succeeded in restoring confident self-rule, frontier security, a loyal and well-educated class of hard-working officials, social stability with a modicum of social mobility, agricultural productivity, Confucian values, and a strong foundation for population growth, commercial expansion, and a rising standard of living. Soon after 1500, the Portuguese and eventually other Europeans arrived off the Chinese coast seeking the land of abundance Marco Polo had described. To a great degree, they were not disappointed. What would disappoint them is the difficulty of gaining direct access to that abundance in the way they would have liked while the Ming system was in place.

Peasant Rebellions in China

Rebellions in China originated at least as early as the Qin empire (221–206 BCE), and their historical roots can be traced to peasant discontent, which tended to reach volatile levels during periods of dynastic decline. The breakdown of imperial order and the rise of peasant rebellions were so frequently linked that each was inter-

preted as a sign or a cause of the other. However, before the year 1000, only one peasant rebel leader managed to attain the dragon throne: the founder of the Han dynasty, Liu Bang, in 202 BCE. In subsequent periods, that exceptional path to power would often be tried but would be successfully repeated only once with the founding of the Ming dynasty in 1368 by a rebel of peasant origin named Zhu Yuanzhang.

Members of China's peasant class, the rural villagers whose hard work and productivity sustained the agricultural foundations of the empire and created the bulk of its wealth, generally thrived in periods of imperial peace and stability. Although free to buy and sell land and to live by the fruits of their labor, nonetheless most peasants lived near the margins of subsistence and were generally subject to the vicissitudes of economic life: competition for land and water, the tax and corvée (forced labor) systems, market forces, the impositions of local magnates and officials, and, of course, the always unpredictable weather. Few parts of China were spared the periodic calamities caused by drought, famine, floods, pests, diseases, and the threats associated with dynastic decline: corrupt and predatory tax collectors, rapacious landlords, banditry, civil war, and invasion. Any combination of these factors or a serious enough case of any one might set off a potentially dangerous rebellion. Any single rebellion, accompanied by a sufficient grievance, an ambitious and charismatic leader, an inspiring doctrine, and loyal and motivated followers, might threaten or topple a dynasty. A good example of a popular ideology of rebellion is the White Lotus Society, whose legendary founder was a fourth-century CE monk. Its eponymous symbol of a beautiful flower arising out of the mud evokes not only Buddhist transformation but also the promise of a corrupt society purified by popular rebellion.

In this later period of Chinese history, an ideological descendant of the White Lotus known as the Red Turbans appeared in response to a great crisis of legitimacy. After the death of Kubilai Khan in 1294, feuds among Mongol princes disputing the imperial succession deteriorated into civil war. After decades of Central Asian oppression, heavy taxation, depredations caused by Yellow River floods, and the onerous burden

► THE RED TURBANS

The Red Turbans were the principal mid-fourteenth-century Chinese rebel movement contributing to the downfall of the Mongol Yuan dynasty (1279–1368) and the rise of the Ming (1368–1644). The Red Turban movement incorporated influences from various sources, some of which entered China during the era of Mongol rule. Ideologically, it qualifies as a popular, subelite, sectarian movement with origins in Persian Manichaeism, the belief that forces of goodness and light are locked in a cosmic battle with the forces of evil and darkness. This belief blended in China with Mahayana Buddhist notions of the existence of a Buddha of the Future (Maitreya) who, in a time of chaos, will descend from the Tushita Heaven to create a perfect earthly order.

During the 1340s when the Mongols began to lose control of their Chinese empire, local monks and spiritual leaders spread these ideas rapidly from south of the Yangzi River through to the

Yellow River Valley and the North China Plain. After 1351, when massive peasant discontent in North China led to armed revolt, the movement developed political aspirations. Several rebel leaders emerged, heading large peasant armies and proclaiming new dynasties. The Red Turbans' insignia was the red headband, or scarf, which symbolized the forces of fire, or light, seeking to purify the world of evil. One early Red Turban member, Zhu Yuanzhang, gradually emerged as the leader of the strongest branch of the movement. Based in Nanjing, he defeated all rivals and founded the Ming dynasty as the Hongwu emperor (1368–1398). Although his dynasty's name—Ming, which means “Bright”—echoes core Red Turban ideals, Zhu Yuanzhang as emperor turned his back on his rebel past and restored the Confucian-bureaucratic style of rule already familiar under the Chinese Song dynasty (960–1279).

—Roland L. Higgins

of labor service repairing dams and dikes, myriads of discontented peasants arose in open rebellion under Red Turban auspices. From the 1330s onward, several rebel leaders appeared under this mantle, each building on anti-Mongol sentiment. One of them, Zhu Yuanzhang, a former monk, arose from humble beginnings in the Yangzi Valley to become a great general and rebel leader. Defeating or subordinating all his rivals, he chased the Mongols and their allies out of China; destroyed their capital at Dadu, near Beijing; and proclaimed the Ming dynasty with its capital in Nanjing, which had been Zhu's headquarters since 1358.

The Chinese Educational and Examination System

During the Song and Ming dynasties (960–1279 and 1368–1644, respectively), government-sponsored education, a standardized civil service examination, and the civil bureaucracy evolved into a mature integrated system that undergirded China's meritocracy. It offered many commoners opportunities for upward social mobility, helped the imperial government exercise effective control over a large population and massive territories, and furthered the integrity of sovereign authority against the hereditary aristocracy and wanton warlordism. At the same time, flaws in the system became exposed and criticized by some perceptive intellectuals.

Zhao Kuangying (also known as Taizu), the first emperor (r. 960–976) of the Song dynasty, was himself a regional warlord before seizing imperial power. Around the time of his coronation he crushed a rebellion of generals and followed it up with a banquet, at which he convinced the generals who had remained loyal to him to retire with generous pensions. Thereafter he built a central bureaucracy run by scholar-officials,

which led to a much greater concentration of imperial power in his hands than had been seen in any previous dynasty.

During the next three centuries, despite the occupation of northern China by various non-Chinese peoples, such as Khitans (Qidans), Tanguts, Jurchen (Ruzhen), and Mongols, the Song government continued sponsoring and managing education at academies in the imperial capital, first at Kaifeng and then, after Kaifeng was captured by the Jurchen in 1126, at Hangzhou. While *kuozhijian*, the School of the Imperial Talents, was transformed into a ceremonial temple, *taixue*, the Advanced School of Classics, was reorganized and expanded. According to regulations drafted by Wang Anshi (1021–1086), the reform-minded councilor of Emperor Shenzong (r. 1067–1085), strict rules of advancement by grade were established for this school. From an annual examination of 2,000 first-year students of the Outer School, a certain number were selected to move up, filling vacancies in the Inner School. There, 300 students would be required to participate in a biennial examination, and the successful ones moved up again, filling vacancies and continuing their academic careers in the Upper School, which was composed of 100 of the empire's most talented students. A significant number of imperial bureaucrats were then "recommended," or chosen, from these 100 after an intensive and progressive process of internal examinations, competitions, and selection. The process was called *gongju*, the civil service recommendation. It is recorded that for a few years when the uncertainty of Councilor Wang's extensive social and economic reforms led to the suspension of the civil service examination, there were 3,800 students enrolled in the school, and internal recommendation became the only means of selecting civil bureaucrats.

Meanwhile, during the early Song years both local academies and itinerant tutoring and learning grew at a much faster pace than state-sponsored education. While the imperial academies slowly recovered from the damage caused by the wars of the tenth century, the prefectures and counties sponsored their own educational academies for recruiting civil servants. Their initiatives and active promotion of education, supported by reform-minded officials, in turn

stimulated the remodeling and formalization of the *keju*, the civil service examination. A privately tutored person would be able to obtain the degree of Learned Talent after passing a county examination. He became a Qualified Candidate after passing the prefectural examination and thus became eligible to be tested directly by the emperor in the imperial palace, along with graduates from the government-sponsored academies. Most of the Northern Song emperors (960–1126) were personally involved in testing the Qualified Candidates and rewarded the best among them, often 36 in number, with the title of Advanced Scholar. An Advanced Scholar was often appointed to the post of County Magistrate or its equivalent. However, palace examinations continued to be held irregularly by special imperial edicts.

By the end of the Northern Song period, the Chinese political structure had become so bureaucratic that scholar-officials, both those advanced through examination and those advanced solely through recommendation, formed a newly emerging social class. Moreover, factional struggles between conservatives and reformers poisoned the politics of the imperial court. Among many of the policy disputes between the two parties, the issue of how to reform the civil service system was major. The reformers, led by Councilor Wang, who promoted a systematic imperial examination system as opposed to the internal system of recommendation, won a temporary victory because of the emperor's personal support, which certainly helped the civil service examination system gain popularity. However, the lives and careers of the bureaucrats on both sides depended so much on the emperor and the imperial political apparatus that neither side was able to form a unified voice to advocate an agenda independent of imperial authority. After the reformers failed to bring about real positive changes and exhibited incompetence in dealing with the Jurchen invasion of northern China in 1125, the conservatives won the battle, at least for the moment. They revoked many of Councilor Wang's social and economic reforms but preserved his rules and regulations for the imperial academies. At the same time, the civil service examination system had been so well established that after a few years of setback at the hands

➤ ADMINISTERING THE HUISHI

The official *History of the Ming*, which was compiled under the direction of the Manchu, or Qing, emperors and completed in 1739, details the procedures and regulations of the *huishi*, the imperial examination held in the capital in the fourteenth and fifteenth centuries:

“The Ministry of Rites designates two official examiners to be in charge of the national examination, the *yushi* [scholar and chief examiner] running the inner-section of the Examination Compound and an *anchashi* [inspector and administrator] running the outer-section. During the examination, the *yushi* is responsible for handling questions and booklets, and a group of special associates is designated to supervise such procedures as concealing examinees’ identities, hand-copying the answers by standardized inscription, proof-reading the hand-copies, distributing and circulating the booklets, guarding the doors of examinees’ cells, and searching for and confiscating materials illegally carried into the examination.

The qualified candidates are those who are graduates from the Great School and from the schools of prefectures, provinces, and counties, those who are scholars without holding offices, and those who are civil servants without formal official ranks. All of them must have been inspected officially and judged to be morally sound, behaviorally upstanding, and literarily competent by the official inspectors. Meanwhile, whoever are being disciplined by their schools, or have been removed from the offices of the civil service, or come from a family of prostitutes or other indecent professions, or are in the time period of mourning the death of their parents are barred from taking the examination.

On the front page of a booklet, an examinee’s parental names of three generations, his place of

birth, and his age are recorded together with the book titles of the classics he has studied and the seals of the proper offices of recommendation and inspection. On the day of examination, an examinee’s identity is checked through a brief interview in order to prohibit the entry of any impersonator. An examinee will be given three candles if he does not finish the answers before sunset. In writing answers, he must avoid using words that imply his name or the name of his ancestral temple, and must not tell stories about his family. A special official conceals personal information of an examinee by pasting a patch on top, and afterwards stamps a specific identification number along the seams of the patch. An examinee uses black ink to write, and his answering sheet is called “the black sheet,” and a hand-copier uses vermilion ink to make a copy, and it is called “the vermilion sheet.” The examinees live in the same compound, with each having his own separate cell. A troop is assigned to guard the compound. After the entry of the examinees, both the inner-section and outer-section doors are locked, allowing the inner and outer officials to carry out their respective duties.

The Chief Examiner and his associates, composed of distinguished palace officials and outstanding literary scholars, collectively read the papers, rank them, and make a list of candidates to be examined by the Emperor in the imperial palace.”

of the conservatives it would regain momentum in the Southern Song dynasty (1127–1279), when the south became the sole area ruled over by native Chinese emperors and the up-to-then marginalized southern Chinese became increasingly enthusiastic about becoming a part of the civil meritocracy.

The complicated relationship between the civil examination system and Neo-Confucian

scholarship during the two successive Song dynasties is worth noting. Song Neo-Confucian scholars, led by Zhu Xi (1130–1200), introduced the concept of *Li*, the cosmological principle that enabled them to integrate various archaic Chinese notions and ideals, such as the Daoist concept of *Dao* (the Way), along with alien ideas, such as the metaphysics of Buddhism, into a new Confucian construct. They reinvented the

theories of the ancient Confucian sages by editing and offering commentaries on the Four Books (*Book of Great Learning*, *The Middle Way*, the *Analects* of Confucius, and the *Book of Mencius*) and Five Classics, the core of traditional Confucian learning. They also expanded the focus of previous Confucian scholarship. As had been the case for centuries, they focused primarily on the daily ethics of human relations, but they did so now by outwardly embracing the cosmological truth of the universe and inwardly emulating the heart and soul of the ancient sages. It was also through their efforts that Confucian scholarship began to truly occupy the center stage of Chinese education and the civil examination. Schools at all levels emphasized study of the Confucian classics but now with a Neo-Confucian perspective; the civil service examination tested how to interpret and develop Confucian theses and arguments within this Neo-Confucian system of thought, and scholar-officials became ever more conscious of their social responsibility to save the world. Moreover, many of the leading Neo-Confucian scholars established private academies, spreading the new Confucian learning and ideology all over China, especially in southern China, and this enabled southern Chinese youths to compete with their northern counterparts. More than a dozen private academies emerged, each commanding hundreds of followers and thousands of admirers. Renowned scholars traveled around the country lecturing in front of often large audiences to promote the scholarship of Neo-Confucian Li and encourage listeners to cultivate their inner perfection, preparing for the noble mission of serving the empire and the people. The main stream of Chinese intellectuals departed from the escapism and rhetorical vogue of previous centuries, and many turned out to be conscientious duty-bound reformers.

The Chinese meritocracy suffered a setback during the Yuan dynasty (1279–1368). The Mongol military aristocracy and its non-Chinese functionaries dominated government operations, and the Chinese-styled bureaucracy was kept at a minimal level to perform managerial tasks. The size of the imperial academies was significantly reduced to enroll no more than 300 students, at least half of them being gifted youths of Mongol

and central Asian ethnicity. Private schools survived only after they had been forced to conform to Mongol rules and regulations. The civil service examination ceased to be open to the public, and civil servants were recruited exclusively from the graduates of the imperial academies. Neo-Confucian scholarship became marginalized, and its scholars were reduced to the ninth social rank, lower than thieves and only above prostitutes. In general, instead of intellectual work, artisan skills and inventive manufacturing marked the realm of Chinese achievements under Mongol dominance.

However, no sooner did Zhu Yuanzhang, better known as the Hongwu emperor (r. 1368–1398), establish the native Ming dynasty than he restored the Chinese-styled meritocracy. He did so partially because he had witnessed the persecution of Confucian scholars by the Mongols and partially because he needed to attract capable men to consolidate his authority, since he was himself of humble origin and was brought to power through a peasant rebellion. The emperor and his successors rebuilt and regularized the civil service examination according to Tang and Song models. However, the reinvented system differed from the previous ones in four respects.

First, the practice of recommending scholar-officials directly from the imperial academies, after flourishing during the early Ming period, began to fall into disuse from the mid-Ming onward. Privately tutored students obtained equal status with state-sponsored ones in pursuing the degree of Qualified Candidate through prefectural/provincial examinations, and graduates from the imperial academy were required to join Qualified Candidates to first pass triennial national examinations in the capital and then be tested by the emperor in the imperial palace in order to be appointed to government posts.

Second, the Four Books and Five Classics, widely circulated in Song times, now became the only authorized textbooks for education and the civil service examination. However, after the early Ming period of about half a century, during which students were required to study from a list of authorized interpretations of the textbooks by renowned Song Neo-Confucians, the Yongle emperor (r. 1403–1424) organized a group of scholars to compile a new multivolume text-

book, *The Complete Collection of the Four Books and Five Classics*, supplemented with new commentaries. After its completion, it became the standard textbook for the civil examination. The new scholarship now emphasized the responsibility of intellectuals to serve and obey imperial authority instead of saving the world in general and translated the cosmological principle of Li into the inward meditative nature of heart and mind, exploring the inner potential of humans toward realizing the Mandate of Heaven, knowledge, good conscience, individual perfection, and the noncraving mind. The Ming philosophy of *Xin*, scholarship of heart and mind, now became the preferred Neo-Confucian school as well as an alternative to Song teachings regarding Li.

Third, the civil service examination gradually became regularized as a progressive three-tiered system with certainty and predictability. A fixed date was set for either a local or a prefectural/provincial examination, held annually and triennially, respectively. The degrees of Learned Talent and Qualified Candidate were rewarded to those who were selected from the respective examinations. It was also fixed that the year after the prefectural/provincial examination, the Qualified Candidates were summoned to participate in the national examination held in the imperial capital, and the successful among them were to be tested in person by the emperor himself. Different ranks of the highest degree (Advanced Scholar) and corresponding official appointments would be rewarded to them.

Fourth, the Eight-legged Essay was adopted as the official essay format for the written test, the most important component of the examination. The format was originally used in Song times to encourage test takers to demonstrate their ability to analyze timely controversies, based on accumulated materials quoted from the ancient Confucian sages, in order to avoid offering simplistic solutions. The Ming format of the Eight-legged Essay was designed to produce a thesis paper according to much more restrictive rules. From opening statement to conclusion, an acceptable composition was required to take eight steps, each conforming to specific technical rules including the number of words, the style of sentences, paragraph layout, rhyming, symmetry, tone balance, and couplet style. More-

over, discussion of historical events occurring after 221 BCE (the first year of the Qin dynasty) was disallowed, since the ancient Confucian sages could not have anticipated what would happen after they passed away. History had hitherto been always a major component of and the most meaningful reference point for the knowledge possessed by Chinese intellectuals, but this rule pushed them to rediscover and reinvent the truth in their hearts not from the experiences of the recent past but rather from the archaic past. This immediately raised the eyebrows of the critics, who correctly suspected that this rule was intended to prevent any ridicule and critique of Zhu's imperial reign. In the long run this rule had a profound and long-lasting impact on the worldviews of Chinese elites, who would often feel more comfortable with truths based on the mythic glories of an archaic past than with experimentation with new perspectives.

Contrary to what is often stated, the Ming emperors were not xenophobic. Zheng He's seven naval expeditions of 1405–1433, the active involvement of Christian missionaries in the cultural affairs of the imperial court during the sixteenth and seventeenth centuries, and the spreading of Buddhist and Daoist temples all over the country marked a quite tolerant imperial policy toward aliens and alien cultures. At the same time, the imperial government spent huge amounts of tax revenues, collected from revived agriculture and fast-growing trade and commerce, to sponsor elite academies and libraries and to print multivolume encyclopedic collections of the Chinese classics and other literature. Moreover, a large number of students from Japan, Korea, Southeast Asia, Mongolia, and central Asia were attracted to the Ming court to study the Chinese classics and to take the examinations, and Jesuit missionaries from Europe were certainly impressed by the Chinese meritocracy when comparing it with the deteriorating aristocracy in their home countries.

However, while the civil meritocracy was enjoying full bloom, criticisms centered on the flaws of the civil service examination system emerged. Critics exposed cheating of all kinds to the public, ridiculed career students for wasting their whole lives to pursue an illusive goal, questioned the tricks of favoritism played by

supervising officials in the selection processes, and, most of all, cast doubts on the pedagogical shortcomings of the Eight-lagged Essay format, which was progressively becoming more distanced from reality due to the applying of bizarre rules to historical interpretations.

Meanwhile, the structure of the civil service bureaucracy began to suffer from crises and critics of its own. Of course, the Chinese people, commoners and elite alike, preferred the present civil bureaucracy to the aristocracy and warlordism of the past simply because the examination system, despite its intrinsic flaws, often produced 40–50 percent of the civil servants from comparatively plebeian origins, which gave average people hope for upward social mobility. And most of the scholar-officials used their positions and influence at the imperial court to bring real benefits to their home villages and towns. However, just as with the clans, which had dominated post-Han China for more than three centuries (220–589), and the warlords, who had disturbed Tang's tranquility, some of the Ming scholar-officials accumulated enormous amounts of wealth and power and also turned their offices into hereditary quasi-aristocratic holdings. They eventually formed their own court factions, often allied with eunuchs, the emperor's in-laws, and other interest groups; divided the imperial court; engaged in sectarian battles against each other; and destabilized imperial authority. It is well recorded that the court of the late Ming dynasty experienced the most ugly political havoc in Chinese history.

Moreover, with more and more degree holders produced by more and more regular examinations, the Ming bureaucracy grew so rapidly that it added unbearable financial burdens on the government. More degree holders asked for more bureaucratic posts, a bigger bureaucracy demanded a greater amount of tax revenue, and heavier taxation upon the people led to higher levels of social discontent and resistance. The malignancies caused by the successful operation of the civil service examination, the rapid growth of the bureaucracy, and the ever more bloody court battles between bureaucratic factions would ultimately bring down the Ming dynasty when it faced Manchu pressures in the 1600s.

Japan from the Late Fujiwara Era through the Kamakura Shogunate

Until the rise of the Kamakura shogunate in the twelfth century, the Fujiwara family dominated Japanese society, serving as the conduits who bound provincials to the imperial court and by simply awing the same provincials with their power. The Fujiwara family ascended to power by monopolizing the position of regents to the emperors of Japan. They bypassed state institutions and controlled Japan through private rule until their position was challenged by Emperor Go-Sanjo in 1068, which aided the rise of two other powerful clans, the Minamoto and Taira, who challenged Fujiwara power. The Taira family displaced the Fujiwara but were later defeated at the hands of the Minamoto clan during the Gempei War (1180–1185), which also led to the death of the reigning emperor.

After defeating the Taira clan, the founder of the Kamakura shogunate, Minamoto Yoritomo, promised regional security that bypassed the emperor and the imperial court of Kyoto and guaranteed the land holdings of his followers. Given the title of shogun (military commander) in 1192, Minamoto Yoritomo maintained a puppet emperor in Kyoto and ruled Japan from his provincial headquarters, or *bakufu* (tent), at Kamakura, thereby establishing the Kamakura

➤ KUSUNOKI MASASHIGE, THE IDEAL SAMURAI

The *Taiheihki* (*Chronicle of the Grand Pacification*), which was composed by a number of anonymous Buddhist monks between roughly 1333 and maybe as late as 1370, recounts the battles and intrigues that characterized the period 1318–1333, when Emperor Go-Daigo was in the process of destroying the Kamakura shogunate.

In telling the story of the defense of Akasaka castle in 1331 by a small band of warriors led by Kusunoki Masashige, the monkish historians noted how this spirited defense, in the face of overwhelming odds, revitalized the imperial cause—a cause that had suffered a major setback with the recent capture of the emperor, along with many of his followers, at the fortified monastic temple of Kasagi.

According to the *Taiheihki*, 300,000 enemy soldiers (obviously a gross exaggeration) faced Masashige's small band of several hundred. However, because this samurai was one who would “scheme in his tent to defeat an enemy a thousand leagues distant,” the imperial forces were able to hold out day after day, employing a number of clever stratagems to defeat and kill large numbers of their foes. Finally, after killing numbers of the enemy “beyond counting,” and

when all of the castle's food was gone, Masashige planned one final coup. Believing that “the true man of courage ‘is cautious in the face of difficulties and deliberates before acting,’” he decided to fake his and his men's deaths, thereby living to fight another day. He ordered that a large hole be filled with the bodies of slain enemies and the castle set ablaze. Before the fire was lit, he and his men slipped away by threes and fives. The opposing army, seeing the fire, rushed in, determined to give no quarter to an enemy that had constantly frustrated and defeated it, but all that the soldiers discovered were bodies burned beyond recognition. In their apparent victory, they honored their presumed fallen foe by saying, “Though he was an enemy, his was a glorious death, well befitting a warrior.” Meanwhile, Kusunoki Masashige was safely away. Within two years, he would lead his forces to total victory over the shogun.

shogunate, Japan's first feudal military government (r. 1185 to 1333). After Yoritomo's death, his widow, Hojo Masako, usurped effective ruling power from his Minamoto clan. With the rise of the Hojo family within the shogunate, the imperial court at Kyoto was completely subjugated; the shogunate even decided imperial succession. As Hojo family power solidified, Japan entered a period of new agricultural technologies and a cash economy.

The golden period of the shogunate ended with the arrival of the Mongols. In 1274 and 1281, the Japanese repelled two Mongol invasions that also altered the balance achieved by the Hojo family, inasmuch as the victory resulted in many requests for rewards by local daimyos, or lords. The shogunate had little land to give, however. The resultant discontentment among the Hojo clan's aristocratic followers, as well as the strains

on its resources occasioned by the Mongol invasions, severely weakened the shogunate. The result was an attempt by Emperor Go-Daigo (r. 1318–1336) to reestablish the position of the emperor as the supreme head of the state and its government. The resultant “imperial rebellion” by the emperor and his supporters spelled the end of the Kamakura shogunate. In 1333, the Hojo clan was totally defeated by a coalition led by the emperor and his most loyal supporter Kusunoki Masashige, whom Japanese tradition subsequently revered as the ideal samurai. Another key supporter was Ashikaga Takauji, who switched his loyalty from the shogunate to the emperor at a key moment in 1333. A short-lived Kemmu Restoration of imperial authority followed (1333–1336), but Go-Daigo quickly lost the support of the samurai class. A rebellion ensued, led by Ashikaga Takauji, with Kusunoki Masashige

remaining loyal to his emperor. The emperor's foolish strategy and tactics resulted in the destruction of his army and the death-by-suicide of the defeated Kusunoki in 1336. Ashikaga Takauji subsequently appointed a puppet emperor and in 1338 was given the title of shogun, thereby establishing Japan's second military government, the Ashikaga shogunate (1338–1573).

Japan—The Ashikaga (or Muromachi) Period

The second of three feudal military governments that ruled Japan, the Ashikaga shogunate lasted from 1338 to 1573. The Ashikaga shogunate is commonly called the Muromachi period, or the Muromachi *bakufu* (tent government), after the district in Kyoto where the third shogun, Ashikaga Yoshimitsu (r. 1368–1394), located Ashikaga residences and administrative headquarters.

The founder of the shogunate, Ashikaga Takauji, abandoned his obligations to the preceding Kamakura shogunate and the powerful Hojo family by aiding Emperor Go-Daigo's ascension to the throne during the brief Kemmu Restoration (1333–1336). Takauji's motives for defection were mixed, but the result was that the Ashikaga were able to legitimate themselves as the new shoguns. Although the office of shogun was legally under the authority of the emperor, the shogun never received written definition or legal formulation until the Ashikaga dynasty. Un-

der the Ashikaga, the title of shogun was recognized as the chief of the military estate, the keeper of the warriors' customary law, and the ultimate guarantor of land rights.

A major result of the founding of the Ashikaga shogunate was the reestablishment of Kyoto as Japan's administrative, commercial, and cultural center. The principal reason for the dynasty's good fortune was the shogun's transformation not just into supreme military leader but also into civic and cultural leader. The shogunate reached its crescendo from the time of Ashikaga Yoshimitsu to Ashikaga Yoshinori (r. 1429–1441). Rising affluence in Japanese life under the Ashikaga contributed to the creation of such new traditions as the procession of the shogun at the New Year holiday to the classical tea ceremony. Moreover, the official patronage of the Noh theater, linked-verse poetry (*renga*), and Zen Buddhism throughout Japan epitomized the greatest Ashikaga contributions to Japanese cultural history.

The Ashikaga ruled Japan for more than 200 years, and over that period, the bakufu system of government was solidified both socially and institutionally. However, the Ashikaga shoguns had difficulty in exercising their power because most power still remained in the hands of the provincial daimyos, or landholders. The shogunate depended largely on the loyalty of the daimyos, and in many cases, the daimyos worked hard to balance the shogun's interests with their own affairs. By the end of the Ashikaga shogunate, the daimyos increasingly pursued power until open warfare led to the collapse of the Ashikaga dynasty. It was replaced in 1603 by Japan's third and final feudal military government, the Tokugawa shogunate.

► THE DAIMYO SYSTEM

During the Ashikaga shogunate the designation *daimyo* (great names) came to be used increasingly for a new class of military men. Most were “men on the make,” the former subordinates of feudal lords who had lost their positions in the war that had ended the Kamakura shogunate. Indeed, the era has been characterized as the “Age of Gekokujo” (Rule of the Mighty by the Lowly) as one proud family after another was supplanted by their former subordinates. It rang as true for the imperial house that was controlled by the Ashikaga, as it did ironically later for the Ashikaga themselves.

These daimyo, who had only recently won their wealth and power by wresting them away from their feudal superiors, were not about to let anyone, even the shogun, take them away. When the Ashikaga tried to rein them in, they resisted. When the bakufu tried to limit their landholdings, their armies, or the extent of their power, they entrenched their defensive positions within castles. They consolidated their lands and men, their samurai were now required to reside within the castle all the time, and no one was thereafter granted land as a reward for service.

Many of the new daimyo had parlayed small tracts of land into larger holdings, often at the

expense of their own direct feudal lords. Some had been adopted into powerful houses, others had killed their lords, and still others had risen to the top behind their loyal peasant-samurai. Because they did not wish that their samurai would do the same to them, they never allowed their samurai the right to actually live on the land. The samurai now “lived as in an inn.” Everything was provided for them by the daimyo within his castle—meaning that they had no personal retainers, and therefore no band of followers with whom to plot against their lords. They had become professional soldiers.

The daimyo were so independent that they no longer even bothered to seek the official imperial offices that had meant power in the Kamakura era. Control of the land, the taxes, and the samurai was all that counted now. Even the bakufu had become unimportant in the lives of the daimyo. By the middle of the fifteenth century, the only people who cared about the bakufu offices were those who actually held them.

Korea—Influenced by China But Only Semi-Dominated

Yi Songgye (more commonly called Taejo) founded Korea’s longest-lasting dynasty (1392–1910). This kingdom, named Choson, saw its capital moved from Kaesong to Seoul, which became the political, economic, and cultural center of Korea, and it has remained so ever since. To protect the new capital, Taejo ordered the construction of a great 10-mile (16-kilometer) wall with massive gates, parts of which remained into the twenty-first century.

Taejo continued the traditional relationship of tributary diplomacy with China. At least four missions visited the Chinese capital annually. The purpose of each was political, but they also allowed for cultural borrowing and economic exchange. Articles exported included horses, gin-

seng, furs, and hemp. In return, Korea received silk, medicines, books, and porcelain. During the next five centuries, Korea gave virtually unquestioned loyalty to Chinese political institutions and readily accepted cultural influences.

In spite of the fact that Taejo was a devout Buddhist, he directed the dynasty to adopt Neo-Confucianism as the state philosophy. While Confucianism had influenced Korea for centuries, the new approach was to create an ideal society in harmony with the particular attitudes and concerns of the Choson dynasty. The establishment of Neo-Confucian schools became a high priority.

For its first 200 years, Choson experienced peace and prosperity. Taejo and his successors built a strong foundation for the dynasty: they restructured society through the bureaucracy, strengthened the kingdom’s defenses, and

THE EARLY YI EXAMINATION SYSTEM

Confucianism influenced the growth of the Chinese examination system that had been used during the Koryo dynasty (918–1392); in the Choson dynasty, however, it was the principal means of attaining high government office. This system selected officials based on academic achievement as opposed to social status, military success, or wealth, and made professional service the most certain route to acquisition of wealth. The examination system initially produced an effective bureaucracy, but in time it deteriorated and finally ended with the overthrow of the Choson dynasty by the Japanese in 1910.

—Mary E. Connor

promoted its economy and culture. The country's boundaries were established along the Yalu and Tumen rivers.

Taejo's son, Taejong (1400–1418), dedicated himself to the completion of reforms that had begun under his father's rule. Taejong's successor, Sejong (1418–1450), became Korea's greatest monarch by bringing stability and prosperity to his kingdom. In addition to mastering Neo-Confucian learning, he was able to successfully negotiate with the *yangban* (office-holding aristocrats). His rule was known for progressive government, the creation of a phonetic script, economic development, scientific discovery, and technological innovation. He showed great concern for the peasants, providing relief in times of drought and flood as well as tax reform. Scholars were instructed to draw on the knowledge of elderly peasants to publish a book on agriculture; this book became the classic book on Korean agriculture.

During the Choson dynasty, Korea became a model Neo-Confucian society and emphasized the importance of education, social stability, filial piety, and good government based on a hierarchical social order of the elite selected through competitive civil service examinations. Another dimension of Neo-Confucian principles related to male-female relationships. Women were raised to understand that they were inferior and should

be submissive to men at all times; they should be obedient to their fathers, then later to their husbands and in-laws, and when widowed, to their sons. These ideas extended to the practice of ancestor worship, and the eldest male was the spiritual head of the family.

Neo-Confucianism had a strong impact. Prior to this time, Buddhist and Confucian beliefs basically coexisted, but now there were restrictions against the practice of Buddhism and limitations on the number of Buddhist monasteries. Neo-Confucianism condemned the reclusive life of Buddhist monks and rejected the Daoist search for immortality. The civil service examinations were essentially limited to the *yangban*. Consequently, the hereditary elite continued to serve as the majority of the high officials in government. A scholar during the time of King Sejong formulated the idea that, as in China, rulers had a Mandate from Heaven. As articulated by Chinese political philosophers several thousand years earlier, ethical conduct was essential for preserving their mandate to rule, and bad conduct destroyed that right, thereby justifying rebellion.

The influence of Confucianism contributed to the stability of society and perpetuated for centuries the continuation of a rigid class structure. Ten percent of the population was of the *yangban* class, whose goal was education in the Confucian classics and government or military service. They married within their class and lived apart from the rest of society. More than 50 percent of the population was known as *yangmin* (good people), namely farmers, merchants, fisherman, and artisans. The next class, the *chonmin* (the lowborn), consisted of people who followed certain disdained hereditary professions, such as butchery, or were shamans, entertainers, or slaves. It is estimated that more than one-third of the population was enslaved in this system, which existed into the twentieth century.

Confucianism also had an impact on economic development. Its beliefs helped to perpetuate a static agrarian society and promoted contempt for the development of commerce, an activity seen as self-serving and socially divisive. A road system was maintained, but trade within the country and with the outside world (except for China and Japan) remained limited.

In spite of the continuous flow of goods and ideas from China, Korea remained culturally distinct. In social structure, economic development, character traits, language, homes, dress, and food, it was in no danger of being culturally absorbed. Items exported to Japan included rice, cotton, hemp, and porcelain ware. The Buddhist *Tripitaka* (the three sets of canonical Buddhist sutras), Confucian writings, histories, temple bells, and Buddhist images were among Korea's cultural exports to Japan. In exchange, the Japanese exported minerals not available in Korea and luxury items for the yangban class.

Despite the conservative tendencies of Neo-Confucianism, there were significant technological advances in early Choson. A rain gauge was invented in 1442, and accurate records were maintained some 200 years before Europe began such practices. Movable type was more prevalent in Korea in the fifteenth century than any other place in the world. King Sejong and the Academy of Scholars made one of the greatest cultural innovations: a writing system. Known today as hangul, it allowed people to write in alphabetic characters appropriate to their spoken language rather than in Chinese-style (as well as Japanese-style) ideographic characters. The educated classes, however, preferred Chinese characters and continued using them in important documents, whereas women and the lower classes used hangul. The influence of China can also be seen in the arts. Chinese-style landscapes, shrines, and music were characteristic of Choson. During this dynasty, green celadon gave way to white porcelain, and brownware appeared in the sixteenth century.

In spite of the work of its early monarchs, there were signs of difficulties that ultimately weakened the Choson dynasty. Its kings had limited power and for the most part were not highly respected by the yangban. To garner their support, the monarchs doled out generous grants of nontaxable land. For the peasants, this meant increasingly burdensome taxes. Since yangban were forbidden to participate in trade, their principal objective was to serve in the bureaucracy. Extreme competition for government posts led to the growth of hereditary groupings that could no longer marry or associate with rival families. Geographic rivalries between yangban resulted

in systematic purges of hundreds of officials, even executions. Feuds among the nobility had existed in China, but it was a much greater problem in Korea because the kings did not have the power of a Chinese emperor.

The Vietnamese Empire—Influenced by China But Not Dominated

The title of the Vietnamese empire, *Dai Viet* (Great Viet), first adopted by the ruler Ly Thanh Tong (r. 1127–1138), connoted an empire that

► THE CHINESE TRIBUTE SYSTEM

The rhetoric and rituals of the Chinese emperor receiving tribute from a lesser ruler were rooted in the political structure and ideology of China from ancient times. After a unified empire was established in 221 BCE, the Chinese extended what had originally been customary obeisance on the part of lesser Chinese lords to the king into a tribute system that they applied to all foreigners who wanted relations with China. Thus, the system reached well beyond Chinese boundaries and ultimately became one that was more elaborately evolved than any other tributary system in the world. With occasional breaks when China was weak and in disorder, the system was maintained for over 2,000 years. Because of the relative accuracy and volume of Chinese records from the Han dynasty (202 BCE–220 CE) to the Qing (1644–1911), the system's details and refinements are well documented. In fact, from Han to the Ming dynasty (1368–1644), its institutions grew increasingly sophisticated, and the rationale for this system of “barbarian management” became better defined. It was so impressive and dominant by the fifteenth century that it has led to the idea that the system was the basis for a premodern Chinese “world order.”

ruled all the Viet people. Several seemingly contradictory claims legitimated this vision: every dynasty had defeated Chinese invasions; the Viet state and people were civilized according to the Chinese model; and their level of civilization extended to maintaining Viet customs.

During the tenth century native Viet rulers inherited the land the Chinese called *Annam* (Pacification of the South), a former protectorate of China's Tang dynasty that was centered in northern Vietnam's Red River Delta. From 973, its rulers regularly sent tribute to China and disguised their imperial titles. Despite this, China's

Northern Song dynasty (960–1226) regarded northern Vietnam as a rebellious colony and tried to reconquer in 980 and 1075. Both invasions failed and the borders between Dai Viet and China were fixed by treaty in the 1080s. In 1174, Ly Anh Tong (r. 1138–1175) was recognized by China's Southern Song dynasty (1127–1279) as King of the Nation of Annam, a title that implied recognition of Annam as a separate state, although it was still expected to pay tribute to China. From that point until the eighteenth century, Dai Viet maintained a dual identity and diplomatic face. To China, it was the vassal state of Annam; to its Southeast Asian neighbors, such as Champa and Cambodia, it claimed to be a Chinese-styled empire to which they should be subject.

Under the Tran dynasty (1225–1400), a heightened imperial consciousness developed due to Dai Viet's victory over Mongol invaders. A compilation of Chinese-styled imperial annals entitled *The History of Dai Viet* and the creation of legendary imperial founders (the Hong Bang dynasty and Hung kings) also contributed to this consciousness because both traced Dai Viet's origins back to a point that predated the era of Chinese dominion, which had extended from the second century BCE through the ninth century CE. After twenty years of Chinese occupation of northern Vietnam, the Le dynasty (1428–1789) drove the Ming armies out in the early fifteenth century. In its declaration of independence, the *Great Imperial Edict of Pacification of the Ming*, the Le defined Dai Viet as an empire that shared a common civilization with China but had its own territory, customs, emperors, and history.

Already as early as the fourteenth century, Dai Viet expanded to the south, due to its development of Chinese-styled government and intensive agriculture in the Red River Delta (which resulted in never-ending population pressures). Champa, located in present-day central Vietnam, was crushed between the fifteenth and seventeenth centuries, and to the west, Laos came under Dai Viet's pressure beginning in the fifteenth century. Ironically, the expanded empire lost its unity. The sixteenth century witnessed civil war that divided northern Vietnam.

■ Introduction: The Mongol Empire— A Trans-Eurasian Ecumene

The term “ecumene” derives from the Greek *oikoumenos*, which means “that which is inhabited.” The ancient Greeks used it to refer to the known inhabited world. Among world historians, however, it has come to mean an interconnected community of different cultures that not only communicate with one another and exchange goods but also cross-fertilize one another through the exchange of ideas, flora, fauna, and everything else that constitutes culture.

For about a century, between roughly 1260 and 1368, under the leadership of Khubilai Khan and his Yuan dynasty successors in China as well as the khans of the three other major divisions of this great trans-Eurasian empire, the Mongol empire presided over a phenomenon known as the *Pax Mongolica* (Mongol Peace). Inasmuch as the empire at its height reached from the Pacific to (briefly) the eastern Mediterranean, this was an event of world historical significance.

Much like the *Pax Romana* (Roman Peace) of the first and second centuries CE, one should not understand the term *Pax Mongolica* literally. There was plenty of warfare, destruction, and general mayhem in regions of the Mongol empire during this century, especially when a khan died and surviving kin vied to succeed him. Regardless of the uncertainty of maintaining life and limb, especially along the caravan routes of Central Asia, the Mongol khanates did provide a modicum of security along the routes that ran through their lands, enabling adventurous travelers to pass from west to east and east to west.

Given the origins of the Mongol empire, born in widespread destruction and slaughter, this

Mongol Peace certainly might strike the reader as curious beyond belief, but like many other conquerors before them, the Mongols learned that the arts of effective governance are different from the techniques of conquest.

As numerous entries throughout these pages illustrate, in this age of the Mongol Peace the Far East and Far West were joined in a manner never witnessed before, however tenuous and temporary that union was. We already saw under “The Vicissitudes of Avenues for Exchange” an entry on the Silk Road in the age of the Mongol Peace, as well as essays and sidebars on Latin Christian missionaries who traveled to eastern Central Asia and China during this century and the manner in which artistic influences were carried across the trade routes of Eurasia from Latin Europe to China and vice versa. And these are but a few of the instances recorded in these pages of interchange and exchange during the Mongol Peace.

Without recounting such phenomena again, this topic’s entries illustrate how such a trans-Eurasian ecumene came into being, how it was governed, how and why it broke apart, and the consequences of that collapse. One consequence not dealt with here, but already noted in several of the last entries to “The Vicissitudes of Avenues for Exchange,” is that the Mongol Peace gave Latin Europe a taste for direct contact with “the Indies” that was not forgotten after the rupture and death of the Mongol Peace. The result, as we know, was the fifteenth-century oceanic explorations of Portugal and Spain.

—Alfred J. Andrea

Egalitarian Leadership on the Steppe

Egalitarian behavior, which dominated Turco-Mongol social life, was also manifested in the leadership of tribal confederations. Although various leaders of nomadic confederations and empires, from Attila the Hun to Chinggis Khan, gained historical reputations of absolute control and domination over their people, it is an inaccurate perception. Tribal leaders were expected to lead effectively and to provide for their people. Those who failed to do so could be ousted from power, or their followers, especially the great warriors, would seek a more capable leader and leave their current tribe.

While not a democratic process, the selection of a khan, or leader, did not necessarily follow the rule of dynastic succession. Candidates were selected from a pool of qualified individuals from the tribe's aristocratic families, with ideally the

most suitable selected to rule. It was possible to develop a line of nominated succession, but a nominee was not guaranteed succession. The previous ruler's nomination was considered more a suggestion than a decision. Moreover, leadership could move laterally to a brother or a cousin rather than to the ruler's son.

When it came to inheritance all sons, and sometimes the daughters, received a share, and the eldest son was not the primary recipient. Indeed, the youngest son received the father's home and pasturelands. Because of their age, elder sons were expected to have established families and pasturelands and thus were not in need of as much assistance as the youngest son.

This system of inheritance was applied by strong rulers, who could impose their dynastic succession decision by dividing up and allocating imperial territories to their heirs. While not necessarily the best decision, it sometimes prevented heirs from engaging in internecine warfare in the short term, but it eroded the stability of the state over time. Appanages (lands given to heirs, especially younger sons) gained through this form of inheritance became smaller and smaller as each son subdivided his territory to his heirs. As territories decreased in size and resources available, conflict arose. Furthermore, because lines of succession were somewhat amorphous there were more candidates for the throne, and if not handled properly warfare erupted.

—*Timothy May*

➤ NOT ALWAYS EGALITARIAN

As the Mongol empire grew, its Great Khan became increasingly an emperor, leaving behind the rough-and-ready egalitarianism of earlier times. Friar John of Plano Carpini, who traveled to the court of Guyuk Khan in the period 1245–1247 as a papal diplomat and spy, described in a report of his adventures, the first eyewitness Western account of the Mongols, the authority wielded by the khan.

“The Tartar [Mongol] emperor exercises remarkable power over everyone, and no one dares abide anywhere except where he has assigned him. . . . Moreover, whatever order he gives them, regardless of time or place, they obey without a word of dissent. Even if he asks for an unmarried daughter or sister, they give her to him without a murmur. Indeed, every year or every few years, he gathers together young girls from every part of the land of the Tartars. If he wants to keep any of them for himself, he keeps them. The others he gives to his men as it pleases him to do so.”

Power and Authority in the Mongol Ordu

Founded by Chinggis Khan in 1206, the Mongol empire became the largest land empire in world history, extending from China across Central Asia, the Middle East, and into the eastern bor-

ders of Europe. At the heart of this empire was the Mongol royal camp, the *ordu*. The royal *ordu* was the mobile center of Mongol political and military power, where the khan made all major decisions; convened the *quriltay*, the general assembly of all important Mongol chiefs; received ambassadors; celebrated feasts; and held audiences. It housed the khan's family, his entourage, and his court. A temporary tent city on the move, it included housing for emirs, princes, and princesses as well as markets and shops for clothing, food, drinks, and tools. A camp of a 10,000-man Mongol *tumen* (the largest Mongol military unit) could stretch over 50 miles (80 kilometers).

The *ordu* traveled between summer and winter camps. When the khan directed the *ordu* to camp in the vicinity of a city, it often meant disastrous consequences. These included attacks from the encamped nomads, depletion of food and resources, a rise in prices, and especially the destruction of agricultural land that was used for pasture, since the *ordu* also brought with it a large number of livestock, including horses, pack animals, and herds of sheep and goats. On the other hand, the *ordu* camp might have also meant that special attention from the ruling house was granted to a certain region, which almost overnight became the center of the political scene and a bustling commercial center.

The mobile court and the khan's golden *ger* (a circular felt tent with an opening in the vaulted ceiling, also known as a *yurt* in Turkish) were strictly structured and organized. The anonymously written *Secret History of the Mongols* describes a rigid protocol (attributed to Chinggis Khan) for all activities within the royal court: the tent's entrance always faced south, and visitors had to wait along the west wall before being admitted. The protocol even included regulations on serving *qumis*, a drink made from fermented mare's milk, a much-loved Mongol delicacy.

The *ordu* was a symbol of Mongol sovereignty, deeply rooted in the nomadic heritage of the steppe and Chinggis Khan's tradition. The Mongols were a military elite who saw themselves as superior to their subject peoples and desired to set themselves apart from these sedentary agricultural populations whom they had

➤ SUCCESSION TO CHINGGIS KHAN'S POSITION

Overcome by an incurable illness, Chinggis Khan called his sons to discuss the future of the khanate. He warned them of dissent, rivalry, and disobedience and advised loyalty to his third son Ogedai, whom he appointed as his heir, in opposition to Mongol traditions. After his death on August 18, 1227, the *ordus* of the different family members and princes gathered at the royal *ordu* in the region of Keluren to hold a general assembly, a *quriltay*, to discuss the state of the realm and the testament of Chinggis Khan. Ogedai showed reluctance at first to accept succession to his father's throne. According to Juvaini, he declared:

"Although Chinggis Khan's command was to this effect, yet there are my elder brothers and uncles, who are more worthy than I to accomplish this task, and moreover, in accordance with the Mongol custom it is the youngest son from the eldest house that is the heir of his father, and Ulugh-Noyan is the youngest son of the eldest *ordu* and was ever in attendance on Chinggis Khan day and night, morning and evening, and has seen, and heard, and learnt all the *yasas* and customs. Seeing that all these are alive and here present, how may I succeed to the khanate?"

After 40 days of discussion, debate, and feasting, Ogedai obeyed the command of his father and the counsel of the present princes and ascended to the throne.

conquered and now ruled. In order to maintain this dichotomy, the Mongols integrated local customs, laws, and functionaries into their civil administrative apparatus but kept them separate from the Mongol military administration, which followed the *yasa* (law) as represented in the *ordu*. The *ordu* then also served as a military tribunal for Mongols to be judged and punished according to Mongol law.

Even later Turco-Mongol rulers such as the Timurids, who had assimilated into a sedentary lifestyle and spent considerable resources building palaces, mosques, and madrasas, still felt strongly attached to the model and ideal of Chinggis Khan, namely a nomadic military ruler. They preferred to live in the tents of the ordu in the vast gardens set outside their palaces.

Chinggis Khan

Chinggis Khan (1165–1227), often referred to as Genghis Khan, was given the name Temujin at birth. During his lifetime he subjugated more territory than any other conqueror to that point in time, and his successors established the Mongol empire as the largest contiguous land empire in history.

Born to Mongol nobles Yesugei and Hoelun, Temujin was betrothed to Borte of the Onggirad tribe. After the assassination of his father Temujin endured many hardships, but slowly he recruited supporters and assumed a mantle of leadership among the Mongols. A key to his success was an alliance with his father's *anda* (blood brother) Toghril, khan (or leader) of the Keraites, a powerful tribe in central Mongolia. With Toghril's early support, Temujin slowly became the paramount power in the steppe. In the midst of this process, the alliance of Temujin and Toghril dissolved; they went to war with one another, and Temujin emerged victorious. In 1206 Temujin received the title "Chinggis Khan"

after defeating all rivals in Mongolia. The title is thought to have meant Firm, or Resolute, Ruler; an earlier theory that the title meant Oceanic, or Universal, Ruler has been discounted.

Although Chinggis Khan united Mongolia, he soon became ruler of a larger empire. Scholars have proposed a number of reasons why he embarked on a career of conquest. These include a need for booty to keep his supporters pleased, revenge for past offenses against the Mongols, and a maniacal greed for territory and riches. Yet as with all wars of conquest, a single reason is rare, and a variety of factors came into play.

By 1210 the Mongols conquered the XiXia empire, a Tangut state that comprised much of northwestern China and parts of Tibet. Then in 1211 Chinggis Khan led his armies against the Jurchen (Ruzhen) Jin dynasty (1126–1234) of northern China. War continued against the Jin until 1234, well after Chinggis Khan's death. In 1219 in the midst of this war, Chinggis Khan was forced to invade the Khwarazm empire in Central Asia in retribution for the massacre of a Mongol-sponsored trade caravan on the border. Leaving a small force in northern China, he marched west with his main army accompanied by his four sons Jochi, Ogedai, Chaghatai, and Tolui. In a campaign that lasted into 1222, he destroyed the Khwarazm empire by striking at it from several directions, a brilliant strategy that even today excites admiration.

While the Mongols were in Central Asia, the Tanguts of the XiXia empire rebelled in 1222–1223 and joined forces with the Jin. It is often written that the rebellion began when the ruler of XiXia refused to provide troops to Chinggis Khan against the Khwarazm empire. This does not seem likely given the date of the rebellion and the fact that XiXia troops still fought alongside the Mongols in China.

After returning from Central Asia, Chinggis Khan invaded XiXia in 1226. During the campaign he fell from his horse while hunting. Although he eventually died from resultant internal injuries, he insisted that his followers finish the campaign. Afterward they buried Chinggis Khan in a location that remains a mystery, although several modern expeditions have attempted to find it.

The legacy of Chinggis Khan remains impressive even today. An organizational and strategic

BORTE

Borte (1164/65–ca.1225) was the first wife of Chinggis Khan. The daughter of Dei Sechen, leader of the Onggirad tribe, Borte was influential in the life of Chinggis Khan. Betrothed to Temujin Khan in 1174 when they both were children around the age of nine, Borte married the young Mongol leader in 1182.

For her dowry, Borte brought a beautiful sable cloak. This cloak allowed Temujin to cement his alliance with his father's old ally, Toghril of the Kerait. Sentimental ties were nice, but other than the cloak Temujin had little to offer a powerful leader such as Toghril. Yet the alliance was fortunate, as shortly after Borte was kidnapped by the Merkits. This was allegedly to avenge a similar action carried out by Yesugei, Temujin's father, when he kidnapped Hoelun from her Merkit husband. Forced to flee for his life, Temujin abandoned Borte but, with the aid of Toghril, later rescued her. However, Borte was pregnant, possibly with the child of the Merkit prince who had taken her as a wife. Nonetheless, Temujin accepted the boy as his own. Until his death in 1225, Jochi was considered Chinggis Khan's

eldest son. However, concerns of his legitimacy remained a source of trouble throughout the existence of the Mongol empire.

Borte bore Chinggis Khan three other sons: Chaghatai, Ogedai, and Tolui. Ogedai eventually became Chinggis Khan's heir precisely because Jochi and Chaghatai constantly fought over the circumstances of Jochi's conception, and Tolui was considered too young. Besides providing him with children, Borte was often consulted by her husband on matters of state. She was instrumental in ending a power struggle with the shaman Teb-Tengri that threatened Chinggis Khan's dominance after becoming ruler of Mongolia.

Although Chinggis Khan eventually married several other wives, perhaps as many as 23, he considered only his children from Borte as heirs to his power and treated them with preference. Even after Chinggis Khan began to spend increasing time with his newer wives, Borte remained his valued adviser until her death. She died before Chinggis Khan, but the exact year of her death remains uncertain.

—Timothy May

genius, he created one of the most highly disciplined and effective armies in history, but this same genius also gave birth to the core administration that ruled it. His nonmilitary achievements include the introduction of a Mongol writing system, based on the Uighur script, that is still used in Inner Mongolia today; the practice of religious tolerance throughout his empire; and unification of the disparate and often warring tribes of Mongolia. In short, Chinggis Khan's greatest accomplishment cannot be counted in terms of territory gained or military victories but rather in the abiding presence of a Mongol nation and culture. Mongols still venerate him as the founding father of Mongolia.

Chinggis Khan's Successors

Before invading the Khwarazmian empire in 1219, one of Chinggis Khan's wives, Yesui, urged him to plan his succession should he die. Ultimately, Chinggis Khan selected his third son, Ogedai (r. 1230–1240), to be his heir. His selection, although in some ways by default, was not without good reason. Ogedai, among all of Chinggis Khan's sons, possessed a singular ability to find compromises among the various Chinggisid princes. His munificence also became legendary.

➤ CHOOSING A KHAN

Unlike many Western societies, succession to Mongol leadership did not automatically fall upon the eldest son. Inheritance was typically divided among male heirs in a somewhat equal fashion, with the youngest maintaining the actual home or hearth. Political succession among steppe nomads was even more complicated, as leaders had to demonstrate ability not only in war but also in diplomacy by resolving disputes peacefully. For the Mongol empire, a leader also had to be descended from Chinggis Khan.

Ogedai's succession was not without problems, as he was not the first choice. Chinggis Khan may have favored his eldest son, Jochi, but there were questions concerning his lineage. Jochi, born shortly after Chinggis Khan's wife was rescued from the Merkit in 1183–1184, may have been fathered by a Merkit and not the Mongol ruler. Chaghatai, Chinggis Khan's second son, was Jochi's greatest adversary. Chinggis Khan wisely removed the two brothers from consideration due

to their animosity. Tolui, his youngest son, probably distinguished himself the most in terms of ability in both war and peace, but his youth also remained a concern.

Ogedai's succession led many to the conclusion that the throne would always be held by his descendants. Of course, as he had several wives and sons, this led to complications in selecting the appropriate candidates. The *quriltay* in many ways served as a political convention where candidates sought the support of the other princes and generals.

The Toluid coup of Mongke dramatically changed the process, opening the door ideally to descendants of Tolui. The split of the Mongol empire, however, opened the door for any descendant of Chinggis Khan to be a legitimate ruler. Later even powerful rulers, such as Timur-i Leng (Tamerlane), would never take the title of khan but would maintain the pretense of having a Chinggisid puppet on the throne.

—Timothy May

Ogedai proved to be an adept ruler and laid the organizational framework for the Mongol empire.

In addition to directing the completion of the conquest of North China's Jin empire in 1234, Ogedai ordered armies into the Middle East in 1230 and into the western steppes of Russia-Ukraine and other regions of Eastern Europe beginning in 1236. While Ogedai justifiably is known for the expansion of the Mongol empire, Chinggis Khan's historical and mythical image overshadows Ogedai's pivotal role in creating the empire.

Ogedai built upon the rudimentary administration that Chinggis Khan initiated and quickly realized the importance of non-Mongols in administering the empire such as Mahmud and Masud Yalavach, whom he confirmed as governors in North China and Turkestan. Chinggis Khan had originally appointed this father and son to office. Ogedai also turned to the counsel of Yelu Zhuzai, a former official in the Jin empire, for advice in running the empire. Additionally, Ogedai extended the *yam*, or postal system; continued provisions to safeguard the widows

and orphans of fallen Mongol warriors; and encouraged trade. He also built the Mongol capital of Karakorum, forcing trade routes and diplomacy to center in Mongolia. During Ogedai's reign, the Mongol ideology of conquest—that they are destined to rule the world—also took shape.

When Ogedai died in 1240 from the effects of alcoholism or poison (or a combination of the two), his heir was not apparent. Ogedai's own formal election as khan was a foregone conclusion because Chinggis Khan's word and deeds increasingly became viewed as sacred and inviolable. All other khans, however, did not enjoy this benefit. Thus, a *quriltay*, or assembly, of the Chinggisid princes and highest-ranking generals and officials within the empire convened. Ogedai's regent and wife, Toregene, convened the *quriltay* after considerable delay. In the end, her own political acumen won the day with the election of her son, Guyuk, in 1246, over two of Ogedai's other sons but from different wives.

Although short-lived, Guyuk accomplished much. Unfortunately, most of this concerned the

elimination of corruption, nepotism, and cronyism that had crept into the Mongol administration during the regency of Toregene. No major campaigns occurred, although Guyuk drafted orders to complete the conquest of China, the Middle East, and Europe. Allegedly he planned to lead the invasion of Europe himself. However, most contemporary witnesses believed that this was simply a ploy to eliminate his rival, Batu. Batu and Guyuk had quarreled during the initial campaign into Russia, with the argument stemming from the questionable parentage of Batu's father, Jochi. Guyuk, however, died not long after beginning his march. Had he lived, the Mongol empire most likely would have been divided by civil war due to the conflict between Guyuk and Batu, the most senior prince in the empire.

The death of Guyuk led to another period of regency under his wife, Oghul-Qaimish. Like the regency of Toregene, this period marked an era of mismanagement but without the political acumen of Toregene. Oghul-Qaimish spent more time with shamans, fortune-tellers, and that ilk than in affairs of state. She did little to begin the process of selecting a new Great Khan. This led Mongke, the son of Tolui (Chinggis Khan's youngest son), to stage a coup. Supported by his mother, Sorqoqtani, who was also one of the leading figures within the empire, and Batu, Mongke convened a quriltay, won acceptance, and ascended the throne.

His election was not without opposition. Shiremun, a son of Ogedai who had lost his previous bid to power to Guyuk, attempted a coup against Mongke. Mongke learned of the plot and quickly purged the empire of many members of the Houses of Ogedai and Chaghatai, leaving only those who swore oaths of loyalty. In addition, Oghul-Qaimish was brought to trial on charges of mismanagement of the affairs of the empire and possibly witchcraft. Despite her high rank, she was found guilty and executed.

Mongke was perhaps the Mongols' most successful ruler, conservative in nature and deliberate in his actions. His first task was to reform the administration and eliminate sources of corruption. Once this was settled, he decreed that two armies set forth and subdue the remaining enemies of the Mongols. He personally led, along with his brother Khubilai, a large army against

the Song dynasty of southern China. Meanwhile, his brother Hulegu led an army that eliminated the Ismaili Assassins of northern Iran in 1256 and the Abbasid caliphate in 1258.

Mongke's promising career ended in 1259 during the campaign in China. His death set the stage for the dissolution of the empire. His brother Khubilai ultimately won a civil war against Ariq-Boke, the fourth son of Sorqoqtani, in 1265. Yet in the five years of war, the empire fragmented. Hulegu found himself at war with the descendants of Jochi and with the descendants of Chaghatai. Although Khubilai maintained the title of Great Khan, his power over the other khanates was illusory, and they increasingly acted on their own even as Khubilai established the Yuan dynasty, which ruled East Asia until 1368.

Governing the Mongol Empire

Mongol government originated in two sources: the imperial clan (the lineage of Chinggis Khan) and the *keshik* (the khan's bodyguard). The imperial clan viewed the Mongol empire as its joint property, and thus all members had representatives to watch over their interests throughout the administrative apparatus. On its part, the *keshik* served not only as a bodyguard but also as a training center for generals and provincial governors, or *jarquci*. Few governors of large territories came from outside of the *keshik*.

Although these two institutions ultimately ran the empire, the empire functioned because of the abilities of other groups. As the Mongols

► THE YASA

The Mongol empire was governed by a rule of law known as the *Yasa*. This law code was a combination of steppe nomadic tradition and imperial decree and was strongly influenced by the *biligs* (maxims) of Chinggis Khan. It was originally compiled by Chinggis Khan's adopted brother, Shiqi Qutuqtu. Although the *biligs* were often considered examples of proper and virtuous behavior, they were not laws. The *Yasa* was not the law of the land but instead was applied to the nomadic population of the empire.

Although there are plenty of examples of *biligs* in the primary sources, there is no surviving example of the *Yasa*, if indeed a written copy of it ever existed. As it was primarily customary law of the steppe nomads and applied to nomads, it is likely that no one saw a need to write those laws down, as all of the nomads understood them. Nonetheless, it remained in use in the fourteenth century well after the Mongol empire had split into four khanates in 1265. Even after the Mongols began convert to Islam, many resisted the switch to Islamic law.

—Timothy May

conquered territories, they appropriated many of the ruling structures and personnel of the conquered. The Mongol khans always respected and recognized the need for talented administrators. For example, Yelu Qu Cai (1189–1243), formerly of the Jin empire, entered their service, and Mahmud Yalavach (d. 1262) and his son Masud Beg, both formerly of the Khwarazmian and possibly Kara-Khitan empires, joined the Mongol administration, as did countless others. Furthermore, when local rulers submitted peacefully they often maintained their rule as Mongol vassals; thus, very little changed for the region in administrative terms. These facts have led many to conclude that the Mongols relied basically on native administrators to run their empire. Modern scholarship, however, has refuted that theory.

The Mongols spent considerable energy in organizing their territories. In 1206 the newly proclaimed Chinggis Khan distributed people and

territory to his sons and generals, organizing the society not only for military action but also for gathering tribute and taxes. The key principal element for the organization and administration of society was the *mingan*, or unit of a thousand. This could be 1,000 people for warfare or 1,000 households for nonmilitary purposes. Furthermore, although illiterate, Chinggis Khan recognized the value of written records and commenced an educational program for his offspring and the creation of a secretariat.

Once outside of Mongolia, the key for the Mongols was their dual system of governance: military and civilian. During the period of the initial conquests the generals also governed. This was particularly true along the frontier, where *tammacin* were stationed. These special armies varied in size but had the purpose of not only defending the borders but also expanding Mongol influence either directly or indirectly. The leader of the *tammacin*, known as a *tammaci*, also served as a governor. The quality of rule by these *tammaci* varied from excellent to rapacious. The various populations that came under their jurisdiction also held different opinions. Chormaqan, who ruled much of Persia, Georgia, Armenia, and Azerbaijan in the 1230s, was considered by the Armenian Christians to be a fair and moderate governor, whereas many of his Muslim subjects considered him a thug.

Gradually, though, the military governors were replaced by a *jarquci*, aided by civil administrators known by three terms: *daruqaci*, *basqaq*, and *shabna*. The variance in terms reflects the origins of the words. *Daruqaci* is a Mongolian word, whereas *basqaq* and *shabna* are Turkic and Persian, respectively. The so-named officials had the same duties but were identified by different local titles. These officials had only a few soldiers at their command, but as the *tammaci* had pacified the region and then moved to a new frontier, there was little need for military support. The *daruqaci* was accompanied by secretaries and other officials to integrate conquered regions into the empire. When retained in power, local rulers were often given the title of *daruqaci*.

Because of its breadth the empire contained many ethnicities and cultures, and this was reflected in the empire's administrators. In China,

the Mongols preferred Westerners (anyone born west of China) and non-Chinese, such as Manchurian Jurchen and Khitans, both of whom had previously ruled vast areas of northern China. Marco Polo gained employment under Khubilai Khan because of this preference, although there is no evidence that he ever attained a high rank. Generally speaking, the *shi*, the traditional Confucian bureaucrats of China, were left out of the administration. This was due partially to the Mongols' distrust of the *shi* but also to attitudes of the *shi* themselves. *Shi* distrust came from the fact that the Mongols did not value the Confucian system of governance; these new imperial masters limited the positions and level in which the *shi* could serve in the administration. Thus, many retired to a private life of scholarly or artistic pursuits.

The government of the Mongol empire was an entity that was flexible and efficient when managed properly. However, because of its flexibility, it was also easy for corruption to penetrate it and create the circumstances where the population was heavily exploited.

Breakup of the Mongol Empire and Its Consequences

The civil wars that ensued after the death of Mongke Khan (1250–1259/1260), the last ruler of a unified Mongol empire, had far-reaching consequences. While the Mongol empire fragmented into four smaller yet still very powerful states, some unity remained. The divisions among them, however, held ramifications not only for the em-

Fifteenth-century miniature painting depicting a hunting scene and the meeting of Marco Polo and Khubilai Khan. Polo finally reached the court of the Mongols at Dadu about 1275. From a copy of *Libre des Merveilles du Monde* ("The Book of Marvels"), by Marco Polo. (Archivo Iconografico, SA/Corbis)

pire but for other regions as well. The war for succession fought between Mongke's brothers, Ariq Boko and Khubilai, lasted from 1260 to 1264, four years of war that allowed the other parts of the empire to establish their own independence as well as their own wars.

With Khubilai Khan's accession to power in 1264–1265, the Mongol empire now consisted of four states. Khubilai Khan ruled the khanate of the Great Khan, consisting of East Asia. The house of Chaghatai, Chinggis Khan's second son, ruled Central Asia. The Jochids, descendants of Chinggis Khan's eldest son, Jochi, dominated present-day Russia, Ukraine, and Kazakhstan. This khanate later gained the name of the Golden Horde but at times consisted of several divisions, or hordes (camps), including the Blue Horde in present-day Siberia, the White Horde in Kazakhstan, and the Golden Horde that ruled from the Volga River to the Carpathian Mountains. In the Middle East, Hulegu, a brother of Khubilai, established the il-khanate of Persia. In theory this state was subordinate to the Great Khanate but carried out its own interests and typically only recognized the Great Khan in diplomatic functions.

Endemic warfare among the khanates was a major consequence of the breakup of the Mongol empire. The house of Jochi and the il-khanate fought several wars over territory in present-day

➤ TRADE AND THE FALL OF THE MONGOL EMPIRE

Goods, knowledge, and ideas had crossed Eurasia freely during the Mongol empire as the Mongols promoted trade. Exotic goods reached Europe in more abundance and with a lower price. Initially, trade still flowed throughout the Mongol empire even as it fragmented, but as wars consumed the Mongol states, trade suffered in many areas. Many routes closed due to chronic warfare, and some merchants refused to use them due to the raiding of caravans. At the same time, new routes opened due to necessity and for nontrade reasons, as the rulers of the Il-khanate and the Great Khanate maintained relations via sea. This aided in sea-borne trade, particularly through the Persian Gulf.

The creation of new states meant new tariffs and taxes, hampering the flow of goods and also increasing prices. Earlier, in the thirteenth and

fourteenth centuries, many Europeans, primarily merchants and clergy, had traveled in the Mongol empire either in hope of converting them or to trade. One such traveler was Marco Polo, the son of a Venetian merchant, who stayed in various parts of the Mongol empire for 17 years. When he returned to Europe, an account of his travels was published. While many did not believe parts of his accounts, his tales of the luxury and wealth of China inspired many. Combined with an increasing knowledge of the world and a desire for luxury goods, such as silk, porcelain, dyes, and spices, many West European states sought new trade routes to India and China to obtain these goods. One person who read and was inspired by Marco Polo's account was Christopher Columbus.

—*Timothy May*

Azerbaijan. Tied to this was Hulegu's destruction of the Abbasid caliphate. The Jochid ruler, Berke, a Muslim, disagreed with Hulegu's actions and used this as a pretext and possibly the real reason for their wars. Over time, both the il-khanate and the Golden Horde adopted Islam; however, religion did not aid in reconciliation, although Islam became the dominant religion throughout the western domains of the Mongol empire.

War continued and contributed to a breakdown in administration as well. The Mongol states gradually declined, disappeared, or spawned new states. The il-khanate collapsed in 1335 and left a power vacuum. This allowed a small kingdom of Turks to fill the void and establish the Ottoman empire. The il-khans also supported a Sufi movement known as the Safavis, or Safavids. In the early sixteenth century, this movement crystallized into the Safavid dynasty and established Shia Islam over present-day Iran, where it remains the state religion.

The Great Khanate ruled by the Yuan dynasty fell in 1368 and led to the rise of the Ming dynasty in China. The remnants of the Yuan fled to Mongolia and attempted to regroup. However, the Mongol princes viewed the Yuan as more Chinese than Mongol and resisted their efforts. Incessant civil war lasted in Mongolia, with vari-

ous groups attempting to gain dominance until the rise of China's Qing empire (1644–1911) that dominated East Asia in the seventeenth century.

The gradual collapse of the Chaghatayid khanate gave rise to Emir Timur-i Leng, known to the West as Tamerlane. Although not descended from Chinggis Khan, Tamerlane attempted to reestablish the Mongol empire and often ruled with a Chinggisid prince on the throne. Although a Muslim, his wars of conquest brought him into conflict with such Islamic states as the Ottoman empire, the sultanate of Delhi, the Mamluk sultanate, and the Golden Horde. Tamerlane never lost a war, and he set back by decades the Ottomans' rise to prominence in Anatolia after capturing Sultan Bayazid in 1402 and provoking civil war in the Ottoman lands. In 1398 Tamerlane also destroyed the sultanate of Delhi of North India. Wars between Tamerlane and the Golden Horde contributed to the demise of that state as well. Tamerlane ultimately died in route to conquer China in 1405.

The Golden Horde slowly fragmented into a number of khanates including the Crimea, the Great Horde, Kazan, Astrakhan, the Nogai Horde, and eventually the Uzbeks. As it fragmented, the Russian principality of Moscow gained its independence in 1480. In many ways, Moscow be-

came a successor to the Golden Horde, as its primary opponents and rivals proved to be the various offshoots of the Golden Horde. Muscovy eventually consumed these, but these groups also proved to be the basis of a number of Central Asian nations.

Among them were the Uzbeks, who under the leadership of Muhammad Shaybani crossed the Syr Darya River in 1500. This forced a descendant of Tamerlane named Babur to abandon Central Asia. Babur in turn established the Moghul (Persian for Mongol) empire in India that effectively lasted until the mid-eighteenth century (and the dynasty lasted till the mid-nineteenth century). Even before the Uzbeks crossed the Syr Darya, some of the Uzbeks resented attempts at central authority and broke away from them, becoming known as the Kazakhs.

Russia and the Mongols, 1200–1400 CE

On the western banks of the Dnieper River in 980 CE, Prince Vladimir I assumed the throne of Kiev in a realm known as Kievan Rus and later known as Russia and Ukraine. As a member of the Riurikid dynasty that ruled the Slav and Finn tribes of the north, Vladimir consolidated his power by uniting the eastern Slavic tribes in the region, which he accomplished through military force and by introducing a common religion among the pagan Slavs, Orthodox Christianity adopted from Byzantium. By the thirteenth century, approximately 300 urban centers comprised Kievan Rus in which leaders in Kiev, the fore-

most city, oversaw the civil, military, and ecclesiastical administration of all Rus territories. A Riurikid prince governed each city and recognized the suzerainty of and paid tribute to the grand prince of Kiev. In these urban centers, craft production and foreign and domestic trade thrived, but peasant farmers comprised the bulk of the population. The fusion of Riurikid princes, eastern Slavs, and the Orthodox Church created a distinct and cohesive society that survived not only early Mongol raids during the first half of the thirteenth century but also the Mongols' political hegemony over Rus, which lasted more than two centuries.

The Mongols initially invaded southern Rus in 1223. According to Russian scribes who recorded this event in the *Novgorodian Chronicle*, "In the same year, for our sins, unknown tribes came, whom no one exactly knows who they are, or where they came from, or what their language is, or what race they are, or what their faith is, but they call them Tatars." Rus sources refer to all the peoples of the steppes, including the Mongols, as Tatars. After their initial foray in 1223, the Mongols completed their conquest of the Black Sea and Caspian steppe regions south of Kiev and then returned to Rus in full force in the campaigns of 1237–1240. In the winter of 1237–1238 they sacked and destroyed four Rus cities northeast of Kiev and by the end of 1239 had subdued the entire south. In 1240 Kiev surrendered to the Mongols' massive siege, but Novgorod, to the far north and west, was unmolested. However, despite their initial destruction of Rus urban centers, the Mongols ultimately made significant contributions to emerging Russian political institutions, administrative procedures, and military affairs in the same way that the Byzantine empire continued to influence Russian ecclesiastical matters.

The death of Chinggis Khan in 1227 touched off a power struggle among his sons and grandsons, who eventually divided his vast empire into four regional khanates. The Qipchaq (Kipchak) khanate (commonly referred to as the Golden Horde) ruled Rus indirectly from its capital at Sarai on the lower Volga River from the mid-thirteenth century to the late fifteenth century. Following their conquest of Rus, the Qipchaq Mongols maintained their predominately nomadic

► TALE OF THE DEATH OF MIKHAIL IAROSLAVICH IN THE HORDE

A vicious rivalry for the throne of the grand prince of Rus marked the early decades of the fourteenth century. This excerpt from the *Tver Chronicle* tells how Prince Yuri (Iurii) of Moscow traveled to Sarai in hope of persuading Khan Uzbek to confer on him the title, which rightfully belonged to Mikhail Iaroslavich of Tver, and the result of that entreaty.

“In the year 6826 (1317–1318) Grand Prince Mikhail sent Oleska Markovich to Moscow as an ambassador of good will, and Prince Iurii killed him. That same year Prince Iurii Danilovich and Kavgadyi [a Tatar general] went to the Horde. . . . When Prince Iurii and the instigator of all the evil, the lawless and cursed Kavgadyi, arrived at the Horde, by the devil, they began to slander Grand Prince Mikhail to the lawless Tsar [Khan] Uzbek, saying, ‘Prince Mikhail has gathered much tribute from the cities, and he is intending to go to the Germans [with the tribute], but he won’t be coming to you.’ The Tsar became enraged, ordered his [Mikhail’s] son Prince Konstantin starved to death, and locked him up in a chamber. When this happened, certain people said to the tsar, ‘If you kill him, his father will not come to you.’ And he ordered him to be released. When that same year was coming to an end, the orthodox Grand Prince Mikhail came to the Horde. . . . And as was the custom he gave presents to the princes, to the tsar’s children, and then to the tsar himself. When Blessed Mikhail had been in the Horde for one month, the tsar spoke to his councilors: ‘What have you told me about Prince Mikhail? Judge him with Iurii.’ Then they judged [Mikhail] as guilty, not telling the tsar the truth, but slandering him to the lawless Tsar Uzbek. The next week they brought him to the court bound, and having judged him, they said thus to the Tsar: ‘Mikhail is deserving of death.’”

way of life and tribal customs, and because their khan was primarily concerned with maintaining his power on the steppes, they largely refrained from intervening in the internal affairs and cultural practices of the Russians. As a result, the Riurikid dynasty and the Orthodox Church transcended Mongol hegemony. What the Qipchaq Khanate did demand from the local Rus princes was annual tribute (*iasak*) delivered by the prince in person, after which the khans conferred upon the Riurikids the *iarlyk*, or the right to rule for another year. In addition, the Mongols expected the Rus princes to take a census of the local population, provide goods and troops for the Mongol army, maintain the Mongol system of posts called the *yam*, and collect taxes. Thus, the Mongols were less interested in the Russians as subjects and more interested in extracting tribute, gifts, and commercial products from the region.

The Mongol impact on Russian society, therefore, primarily affected its elite: rulers, nobles, court officials, clergy, and merchants who traveled to the khanate to deliver goods. Due to their frequent and often extended visits to Sarai, Russian princes observed Mongol administrative procedures and incorporated them into their own practices at home. One example is the Muscovite *pomest'e*, a system of military land grants that not only permitted the Russian princes of Muscovy to maintain a standing cavalry but also to use the military to collect taxes and provide other administrative and judicial functions in certain Rus provinces.

The Russian Orthodox Church flourished during the Mongol period. In the thirteenth century the shamanistic Mongols exhibited considerable religious tolerance toward all religions and granted the Russian Church substantial autonomy. The Qipchaqs believed that all religions were true and linked all people with one God. Even after the Qipchaq Khanate converted to Islam in the fourteenth century, the Mongols maintained their permissive religious stance. Six extant *iarliki* (Mongol decrees) granted the Russian clergy protection from all taxation and tribute and even protected Church property from any interference from Mongol or Russian secular authority. All that the Mongols required of the Church was

prayers for the health of the khan in exchange for Mongol protection and support.

Many scholars associate the rise of the small principality of Muscovy in the fourteenth century with the Mongols because the title of grand prince of Rus depended more on Mongol military support than traditional dynastic conventions. For example, in 1317 the Mongol khan, Uzbek, awarded the title of grand prince to Iurii Danilovich of Muscovy because Iurii had married the khan's sister and presented himself as the most capable of collecting and delivering tribute to the Mongols. The Riurikid dynasty had a difficult time accepting the Danilovichs as legitimate grand princes, which led to a series of fourteenth-century conflicts among the princes of Rus. This in turn forced the Danilovichs of Muscovy to serve the Qipchaq Khanate faithfully in order to maintain their power. Tribute payments were on time and even exceeded the required amounts.

Throughout the fourteenth and fifteenth centuries, Muscovy embarked on a mission of territorial expansion and political consolidation of Rus principalities. The Muscovite princes, who spent a great deal of time with their Tatar overlords, integrated Mongol political and administrative practices—as well as the Tatars themselves—into Muscovite society and its institutions. Moreover, Muscovy pursued alliances, including marriage alliances, with other Rus principalities in order to gain dynastic acceptance. The Qipchaq Khanate, meanwhile, began a period of internal conflict and demise. By the time the Qipchaq Khanate succumbed to the Crimean Khanate in 1502, the Muscovite princes had already gained their political independence even though they continued to pay tribute to the Crimean khans.

Also during the fifteenth century the Muscovite princes turned to the Russian Orthodox Church in order to create an image of legitimacy for their clan. The Church responded by formulating an anti-Tatar ideology in its effort to legitimize the Muscovite princes as defenders of the Christian faith against the oppressive—and Muslim—"Tatar Yoke." These sentiments were interpolated into revisions of the Rus chronicles after 1448; that is, at a time when Russian church

officials no longer had to follow the dictates of the Byzantine Church, which had maintained a policy of accommodation with the Qipchaq Khanate, the Russian scribes inserted derogatory terms and phrases against the Mongols whenever they recopied the old Rus chronicles into new manuscripts. Why this shift in policy with the Byzantine Church? In 1439 representatives of the Byzantine (Greek) Church met with their Western (Latin) Church counterparts in Florence and agreed to unite the divided Christian churches by accepting the principle of papal primacy. In reaction against this perceived apostasy from the Orthodox faith, the bishops of Rus appointed their own Russian metropolitan without the approval of the "heretical" patriarch of Constantinople. After 1448, the Muscovite clergy were free to construct a Byzantine (i.e., Orthodox Christian) rather than Mongol (i.e., Muslim) model for their ideal secular government. This served the political interests of the Muscovite prince by presenting themselves as defenders of the Christian faith. Yet prior to 1448, church scribes writing the chronicles generally followed the rule that the less said about alliances between Christian states and their Mongol (and eventually Muslim) neighbors, the better. Even so, some unrevised chronicles portray the Tatars as fair rulers whom God had placed in a position of power.

Recent research suggests that in subsequent centuries, historians reading the interpolated Russian chronicles concluded, incorrectly, that the Rus princes had consistently striven to throw off the so-called Tatar Yoke. Today, however, the cross-cultural connections between the Russians and the Mongols that lasted for more than two centuries are receiving new attention, and the picture that emerges is of a relationship not exclusively defined by hostilities or economic and political oppression. Frequently, religious tolerance, princely intermarriages, military cooperation, learned administrative practices, Tatar assimilation, and mutually supportive trade dealings defined Rus-Mongol relations.

■ Introduction: Christendom—The Ideal of a Single Community; The Reality of Diversity

According to the Gospel of John (17:21), shortly before his arrest and death Jesus prayed that all who believed in him would be one. Such was never the case. From its earliest days, Christianity experienced personal, doctrinal, and sectarian divisions, and as various polities adopted the Christian faith as a state religion, those divisions took on political characteristics.

During the period 1000–1500, Christianity was divided into a large number of cultural and doctrinal varieties. In his eyewitness account of the Fifth Crusade (1217–1221), Bishop Oliver of Paderborn devoted eight chapters to describing the different Christian groups that he encountered while overseas. And they were just a few of the major branches of that faith that flourished in the East.

Despite this multiplicity of branches, there was only one major political division within Christendom that could be said to have had a religious-cultural basis: the growing schism between states that followed the Byzantine traditions of Constantinople and those that adhered to the Latin traditions of Rome. To put it in terms used by persons then, it was a struggle between New Rome on the Bosphorus (Constantinople) and Old Rome on the Tiber.

To be sure, within each of these two traditions—Byzantine and Latin—there were numerous divisions and political struggles. The second Bulgarian empire, for example, whose people followed the religious traditions of Constantinople, emerged out of a revolt against the Byzantine empire in the 1180s. Under the energetic leadership of Ioannitsa (r. 1197–1207), also known as

Kalojan, it successfully battled first the Byzantines and later the Latin Christian conquerors of Constantinople but only after Ioannitsa had flirted with the Roman papacy and was crowned king by a legate sent from the court of Pope Innocent III (r. 1198–1216). Innocent had been moved by the Bulgarian leader's tantalizing (but never consummated) promise of submitting the Vlacho-Bulgarian Church to the religious authority of Rome. Within the politically splintered Latin West, bloody strife between states that equally owed spiritual allegiance to Rome was especially pronounced. One famous example is that of kings Richard I the Lionheart (r. 1189–1199) of England and Philip II Augustus (r. 1180–1223) of France who went off on crusade together in 1190 but became implacable enemies by late 1191, largely for dynastic and political reasons. From 1193 until Richard's death in 1199, their armies clashed often in western France, and the war continued when King John (r. 1199–1216) succeeded his brother.

That noted, the major religious division within Christendom—Constantinople versus Rome—was inextricably connected with politics. First, there was the issue of competing “Roman” empires. The Byzantines, who called and thought of themselves as *Romaioi* (Romans, the term “Byzantine” being a modern historiographical convention), saw their empire as the legitimate continuation of the Roman empire, which existed in an unbroken line of succession from the reign of Caesar Augustus (r. 27 BCE–14 CE) to their own day, whenever that was. To the contrary, the West entertained the theory of *translatio imperii* (transfer of empire). According to that

theory, just as Constantine had “translated” the empire to Constantinople in 330, the papacy had transferred it back to the West with the coronation of Charlemagne in 800 because the “Greeks” (the Byzantines) were unworthy of it. Therefore, the Germanic “Holy Roman Empire” (as it became known in the twelfth century) was the true continuation of the Christian Roman empire established by Constantine I (r. 306–337), also known as Constantine the Great.

The Fourth Crusade further complicated this situation when its army captured Constantinople in April 1204 and shortly thereafter established the Latin empire of Constantinople (1204–1261), with Frankish emperors who owed religious allegiance to Rome sitting on the imperial throne in Constantinople’s Boukolean Palace. Although Latin prelates were imposed on the churches of the Latin empire of Constantinople in those areas of Greece, Anatolia, and elsewhere that fell to the Frankish crusaders, the vast majority of “Greeks” remained loyal to their Byzantine Christian traditions.

After Constantinople was recovered in 1261 by the forces of Emperor Michael VIII Palaeologus (r. 1259–1282), the threat of conquest by outside forces caused several emperors, including Michael, to seek political accommodation with the Latin West. In return for political-military assistance, several emperors were prepared to offer submission to the religious authority of the Roman papacy. In order to blunt the projected assault on his empire by Charles of Anjou, Michael VIII ordered his emissary at the Second Council of Lyons to offer submission to the Roman Church, which he did on July 6, 1274. Papal pressure forced Charles to abandon his projected campaign against Byzantium, and Byzantine fortunes seemed to have taken a decided turn for the better. The cost, however, was internal turmoil because most inhabitants of the empire refused to submit to Rome, considering such surrender of their sacred traditions to be a sacrilege. In 1277 a Byzantine council declared the emperor a heretic. Complicating matters, the new pope, Martin IV (r. 1281–1285), a Frenchman and total tool of Charles of Anjou, repudiated the deal with Emperor Michael and declared him a deposed schismatic. Once again, now with full papal support, Charles of Anjou was plotting a

massive assault against Michael’s empire. With church union dead, Michael turned to other means to blunt the Angevin’s advances. Michael’s agents stirred up a successful rebellion in Sicily from which Charles had planned to launch his expedition against Constantinople. The empire was saved by the rebellion, known as the Sicilian Vespers of 1282.

Threatened by the advances of the Ottoman Turks, the “Roman” empire of Constantinople turned to the West several times for military assistance in the fourteenth and fifteenth centuries, offering church union in return. Each attempt came to naught. Emperor John V (r. 1341–1391), the son of a Latin mother, offered such a deal to Pope Innocent VI (r. 1352–1362) in 1355 but was not taken seriously by the pope. As the situation became graver, Emperor John traveled to Rome in 1369 (but no representative of the Byzantine Church joined him in this venture), where he publicly accepted the teachings and authority of the Latin Church. But this achieved nothing. Western aid was not forthcoming, and the Byzantines so hated the Latins and their Church that nothing could convince them to join their emperor’s conversion.

As the Ottoman noose closed, one more desperate attempt was made to secure Western assistance at the cost of ecclesiastical independence. Emperor John VIII (r. 1425–1448) left for Italy in 1437, accompanied by the patriarch of Constantinople and determined to submit his Church to Rome in order to save the remnants of his empire. Church union was jubilantly declared in Florence at the Council of Ferrara-Florence on July 6, 1439. Despite the acceptance of Roman obedience by the emperor and his patriarch, once again little was accomplished. A few Byzantine prelates became cardinals of the Roman Church, but only a small percentage of Eastern Orthodox accepted this union and acknowledged papal supremacy. Moreover, Western aid was too little, too late. Fourteen years, less 39 days, after the declaration of union, Constantinople, the last bastion of the eastern Roman empire, fell to the forces of Mehmed II, also known as Mehmed the Conqueror.

One immediate consequence of the union of Ferrara-Florence was a rupture between Russia and Byzantium from which the Russians had

accepted Christianity four and a half centuries earlier. Up to that point, Byzantine emperors and their patriarchs had appointed the chief churchmen of the Russian Orthodox Church including the Greek Isidore of Thessalonica, whom John VIII had appointed as metropolitan of Russia in 1437 because of Isidore's avid support of church union. Upon Isidore's return to Moscow from Italy, where he had accompanied the emperor and been made a cardinal of the Roman Church, he was deposed by the grand duke of Moscow, Basil II (r. 1425–1462), and imprisoned. A Russian successor was named, and henceforward Russian metropolitans were appointed by Russians. The Russians now looked upon the "Greek Church" of Constantinople as heretical. Following the fall of Constantinople it became fashionable in Russia to call Moscow the "Third Rome." The first two Romes had fallen because of their apostasy; the third, led by its orthodox tsar (Caesar), would persist until the end of time as the bulwark of the true faith and the legitimate continuator of the Christian Roman empire.

Ethiopia—The Land of Seyon

The Land of Seyon covered a vast territory of the Horn of Africa, identified mainly with present-day Ethiopia, Eritrea, and Djibouti. It reached its peak in the fourteenth century under the rule of King Amda Seyon I (r. 1314–1344) of the Solomonic (Solomonid) dynasty. He spread Christianity by expanding the Ethiopian territory into Muslim provinces. Christianity dominated the region since the Aksumite empire, but conflicts with bordering Muslim provinces have shaped Ethiopian history and politics to the present.

The kingdom of Aksum, which emerged in the first century CE, functioned as a major trade center for slaves and ivory. Christianity became its state religion in the fourth century. Muslim dominance of the Red Sea trade led to its eventual decline in the eighth century and disappearance in the ninth or tenth century. The succeeding Zagwe dynasty reigned over part of the old kingdom down to 1270. The greatest ruler of the House of Zagwe was King Gebre Mesqel Lalibela (r. late twelfth/early thirteenth

century). According to tradition, during his reign, the famous rock-hewn churches of Roha, his capital (present-day Lalibela), were largely built.

After the death of Yitbarek, the last Zagwe king, a new dynasty arose farther south in the upper territory of Sheba. King Yekuno Amlak (r. ca. 1268–1283) is considered the first king of the Solomonic dynasty. Another interpretation is that he restored the Solomonic dynasty to the Ethiopian throne. According to this theory, the dynasty can be traced back to the meeting of King Solomon and the Queen of Sheba recorded in the Bible and was only disrupted by the Zagwe. Even though the royal chronicles began during his reign, most of the records about the restoration of the Solomonic dynasty are apocryphal and were written centuries later.

Yekuno Amlak imposed Amharic as the court language, while Geez (also called Old Ethiopic) was still in use in the Church. He established his capital in the Shebean region of Tegulet. Sheba included also the rising Muslim kingdom of Adel in the south. Growing friction between the two rival forces, the Solomonic dynasty and the Muslim state, as well as with other neighboring Islamic states kept Ethiopia isolated for almost six centuries.

King Amda Seyon I (r. 1314–1344), grandson of Yekuno Amlak, was a singular figure who dominated the Horn of Africa in the fourteenth century. He expanded his kingdom beyond the Muslim borderlands, conquering lucrative trade routes and establishing a tributary state in the southern part of the territory. Due to these expansions, Christianity spread to frontier areas, and trade flourished. Archeologists have found Byzantine textiles, coins, and other goods in the treasuries of Ethiopian monasteries and churches. Trade disputes, however, between the Christian North and Muslim South resulted in a series of wars and political instability. Furthermore, because royal succession was not dictated by primogeniture, rivalries accompanied each transfer of power.

During Amda Seyon's rule some of the earliest works of Ethiopian literature were composed, the most important being the *Kebrä Nagast* (*The Glory of Kings*). Among the most notable works is Giyorgis of Segla's *Mashafa Mestira Samay Wamedr* (*The Book of the Mysteries of Heaven*

and Earth), which describes the creation of all things. The *Zena Eskender (History of Alexander the Great)* is the Ethiopian version of ancient tales circulating the Middle East and depicts Alexander the Great as a pious Christian.

Sacred art and literature was only found within monasteries. The northern state adhered to its nomadic tradition, with emperors and their entourage living in royal camps. As a consequence, the region did not develop an urban culture. The first permanent capital was Gonder, established in 1632. The nomadic lifestyle had a disastrous impact on the ecological balance. The massive army and the extensive royal court destroyed large parts of those regions in which they temporarily settled.

The crusades to the Holy Land weakened the Muslim neighbors bordering the Red Sea and restrained international trade, although Ethiopians did not participate in these religious wars launched from Europe. In the late fifteenth century, trade in the region slowly recovered, mainly on account of the arrival of the Turks and the Portuguese. Besides the merchants, a large number of missionaries, treasure hunters, scholars, and adventurers came to Ethiopia in search of the mythical Prester John. The myth emerged in Latin Europe in 1145. Some Latin Christians believed that the emperor of Ethiopia was Prester John, a priest-king who could liberate the Holy Land. The Portuguese sent their first diplomatic envoy in 1520, only to find out that the Ethiopian emperor was an ordinary ruler. Even so, the European belief that a mythical king reigned over a powerful and wealthy Christian kingdom in Africa persisted until the seventeenth century.

THE UNDERPINNING OF A ROYAL HOUSE—THE MYTH OF KING SOLOMON AND THE QUEEN OF SHEBA

The mythical meeting of King Solomon and the Queen of Sheba inspired poets and artists for centuries. The ancient country of Sheba extended from southwestern Arabia to the eastern end of the Red Sea, covering the territory of present-day Yemen. Ethiopia presumably also belonged to this wealthy and peaceful kingdom, which had been ruled by queens for more than 1,000 years.

The Queen of Sheba, named Makeda (Greatness) in Ethiopian, was known not only for her legendary wealth but also for her sagacity and beauty. She decided to visit King Solomon of Israel to listen to his wisdom. The king seduced Makeda and converted her to his faith. Their son, Menelik I, stole the Ark of the Covenant, which he then transported from Jerusalem to Aksum, and became the first king of Sheba, ending the matriarchy.

The biblical book of Kings (1 Kings 10:1–13) and the historian Flavius Josephus describe this epic meeting. A more extensive version can be found in the *Kebrä Negast*, which narrates the myth of Solomon and Makeda, the genesis of the second Kingdom of Zion in Ethiopia, and the demise of Israel. These mythical events constitute the foundation of the Ethiopian Orthodox Church and the Solomonic dynasty, which persisted to emperor Haile Selassie (r. 1930–1974).

Byzantium, 1025–1204

At the time of Basil II's death in 1025, the Byzantine empire was the major power in the Mediterranean, with territory that stretched from southern Italy to northern Syria and areas around the Black Sea. Sixty years later, it had disintegrated into civil war and lost much of its core in Anatolia. Dynastic failure was a major problem: Basil II (r. 976–1025) never married, and the empire devolved to his elderly nieces Zoe and Theodora and Zoe's consorts. Basil's expansion

► THE SACK OF CONSTANTINOPLE, APRIL 13–15, 1204

Nicetas Choniates, a Byzantine aristocrat whose family fled Constantinople on April 17, 1204, after being sheltered by a Venetian resident-merchant whom he had earlier befriended, vented his spleen against the Latin conquerors in his monumental *Annals*, a work that spans Byzantine history from August 1118 through the autumn of 1207.

“From the very beginning they [the Latins] revealed their race to be lovers of gold. . . . Having opened the graves of those emperors which were in the burial ground situated in the area of the church of Christ’s Holy Apostles, they stripped all of them during the night, and if any golden ornament, pearl, or precious stone still lay inviolate in these (tombs) they sacrilegiously seized it. When they found the corpse of the Emperor Justinian, which had remained undisturbed for so many years, they marveled at it, but they did not refrain from (looting) the funerary ornaments. . . . [T]he bronze statue of Hera, standing in the agora of Constantinople, was broken into pieces and consigned to the flames. These barbarians—who do not appreciate beauty—did not neglect to overturn the statues standing in the Hippodrome (the chariot-racing stadium). . . . Rather, these too they turned into coinage, exchanging great things for small, thus acquiring petty coins at the expense of those things created at enormous cost.”

Nicetas Choniates, *Historia*, ed. I. Van Dieten (Berlin: De Gruyter, 1975), 647–651. Translation from Deno John Geneakoplos, *Byzantium: Church, Society and Civilization Seen through Contemporary Eyes* (Chicago: University of Chicago Press, 1984), 371–372.

required harsh taxation policies and autocratic control of the aristocracy that could not be sustained, and powerful military clans launched constant rebellions against his successors. New threats developed along the expanded borders: the Petchenegs (or Patzinaks), a seminomadic Turkic people out of Central Asia, crossed the Danube River into the Balkans in 1033; the Seljuks were moving into eastern Anatolia in the

1050s; and about the same time Norman adventurers had established themselves as a major threat to Byzantine territories in southern Italy. Constantine IX Monomachos (r. 1042–1055) attempted to reform the empire for a peacetime economy, weakening the provincial armies. When Romanos IV Diogenes (r. 1068–1071) was captured by the Seljuks in a disastrous battle at Manzikert, civil war followed, leaving Anatolia open to Turkish settlement. Stability was restored when Alexius I Comnenus (r. 1081–1118) seized the throne and established a dynasty that endured through the twelfth century. Comnenian rule was based on distributing power to their extended family and allied clans.

Alexius immediately faced external crises. Simultaneously, the Petchenegs again invaded the Balkans, Seljuk settlements encompassed almost all of Anatolia, and the Norman Robert Guiscard, who had conquered the last remnants of Byzantine southern Italy in 1071, invaded Epirus (present-day Albania) in 1081, claiming the imperial throne for a puppet emperor. After several years of difficult campaigning, Guiscard’s death in 1085 ended the Norman threat, and Alexius defeated the Petchenegs by calling in another Turkic group, the Cumans, in 1091. By 1095 he was ready to restore lost territory in Anatolia. Byzantium now depended on mercenaries from outside the empire (including Turks and Normans), so Alexius turned to the West to seek help and almost certainly requested assistance from Pope Urban II in 1095. The result was the First Crusade.

Alexius extracted oaths of fidelity and promises to restore lost Byzantine territory from the crusader leaders, and fortresses in Anatolia were returned to the emperor. Formerly Byzantine Antioch, however, was retained by the crusaders after a bitter siege, largely due to the crusaders’ belief that the emperor had abandoned them to the Turks. Alexius restored Byzantine stability but on the basis of uneasy agreements with Western powers. Managing the threat posed by the subsequent crusader states and the later crusades that came through the empire became a major focus of Comnenian policy.

John II Comnenus (r. 1118–1143) and Manuel I Comnenus (r. 1143–1180) continued to expand Byzantine stability by leading constant

campaigns. Their success was above all a result of skillful diplomacy and alliances with other states in the Mediterranean. Manuel's wide network of alliances extended from Western Europe to Egypt and included traditional enemies. John and Manuel negotiated marriages with the rulers of Hungary, made the sultanate of Rum in Anatolia a client state, and increased Venetian trade privileges. Alliances with the crusader states were a cornerstone of Manuel's policy, sealed by an oath of allegiance from the ruler of Antioch. Italian republics played a dominant role in trade, and the presence of Latins in Constantinople grew as Byzantine provinces shared in the growth of the Mediterranean economy. Twelfth-century Byzantium regained its prestige through a network of alliances rather than regaining direct control of its lost provinces.

Dynastic failure and the reversal of Comnenian policies proved disastrous for the empire after Manuel's death. His young heir was quickly overthrown in a violent coup. The brutal reign of Andronicus I Comnenus (r. 1183–1185) was noted for his anti-Latin policies and the suppression of aristocrats, and it ended with his being torn alive by the city's mob. His successors, Isaac II Angelos (r. 1185–1195 and 1203–1204) and Alexius III Angelos (r. 1195–1203), were unable to control rivals or provincial separatism, and they unwisely rejected Manuel's policy of alliances with the crusader states. By 1203 the Byzantine empire was disintegrating from within and had created dangerous animosities with the Western powers with which the empire was now irrevocably entangled.

The conquest of Constantinople during the Fourth Crusade was not a Western plot or the inevitable outcome of Byzantine-Latin hostility. The crusaders were drawn into Byzantine factional struggles when they agreed to help a displaced prince, Alexius IV (r. 1203–1204), gain his throne in return for unrealistic promises of men, money, and religious unity. They attacked the city in desperation after Alexius IV and his restored father, Isaac II, who had been unable to keep their commitments, were deposed by the fiercely anti-Latin Alexius V (r. 1204). The crusaders captured the city on April 13, 1204, and sacked the city for three days in search of treasure. The Latin conquest of Constantinople gen-

erated powerful myths that endure today, but above all it demonstrated the failure of inconsistent policies and the danger of factional struggles in a world that Byzantium could no longer control.

Byzantium, 1204–1453

The Latin conquest of Constantinople in 1204 appeared to be the end of the Byzantine empire, but the feudal Latin empire soon disintegrated and lost most of its territories. Three Greek states developed in exile: Trebizond on the Black Sea coast, Epirus in northwestern Greece, and Nicaea in northwest Anatolia. By the 1220s, Nicaea and Epirus were contending with one other to recover Constantinople. The rulers of Nicaea were especially successful in creating a viable state, and in 1261 they retook Constantinople. Michael VIII Palaeologus (r. 1259–1282) inaugurated a dynasty that ruled the empire until its demise in 1453.

The Palaeologan emperors inherited a ruined capital, threats on all borders, and internal opposition. They were forced to maneuver among attacks from the Latin West, Orthodox Christian Balkan kingdoms, and the Turks in Anatolia in a period that saw the growth of a strong Serbian empire and the rise of the Ottoman Turks. Survival depended on widespread diplomatic alliances, resources to support an army, and the ability to command internal resources. Like the twelfth-century Comnenian system, Palaeologan rule was dynastic, and power was shared through

the extended family. In a weakened empire, strife within the ruling family was to prove fatal.

Michael VIII restored the empire and staved off disaster through diplomatic brilliance, but his rule demonstrated the cost of survival. He initiated a building program to restore Constantinople from crusader depredation and neglect and continued the reconquest of Byzantine territory in Greece. Resources came from taxes on aristocrats, debasement of the gold currency, and commercial privileges for Italian cities, especially Genoa. His greatest achievement was to save the empire by averting a Western attack through a web of alliances, fomenting a popular rebellion in Sicily, and even agreeing to religious union with the papacy at the Second Council of Lyons (1274). Rejection of the union at home demonstrated the limits of compromise.

Michael's successors Andronicus II (r. 1282–1328) and Andronicus III (r. 1328–1354) faced new external threats and lacked his finesse in managing them. To conserve resources, Andronicus II reduced the army and virtually eliminated

the navy, relying on the Genoese. An expanding Serbian state attacked Byzantine fortresses along the Macedonian border, culminating in the creation of a minor empire under Stephen Dušan (r. 1331–1355) and a treaty that brought Byzantine cultural influences to Serbia, resulting in some of the greatest masterpieces of Byzantine painting in Serbian monasteries. At the same time, the Ottoman Turks began their expansion and by 1337 controlled most Byzantine territory in Anatolia.

The greatest devastation to the empire, however, was caused by two civil wars over imperial succession. The first took place between Andronicus II and Andronicus III (1321–1328); a second more serious conflict (1341–1357) pitted the supporters of John V (r. 1341–1376 and 1379–1391), heir to Andronicus III, and the regent John Cantacuzenus. Each side called in Serbian, Bulgarian, and Turkish rulers and their troops. By the end of the conflict, Serbia had taken much of western Greece, and the Ottoman Turks held territory in Thrace, positioning themselves to

➤ MOUNT ATHOS

As Byzantine political power weakened, its Orthodox identity grew. From the tenth century onward, Mount Athos, the Holy Mountain (Agion Oros), was the most important ascetic center in the Orthodox world. Founded on an isolated peninsula in northern Greece, it housed monasteries of Georgian, Bulgarian, Russian, Serbian, Armenian, and Greek monks. Its original charter was strict, prohibiting eunuchs, women, and even female animals from the peninsula. In the late Byzantine period, Athos became a center of Hesychasm (a form of silent mystical prayer) and later adopted a semieremitic lifestyle. The communities of Mount Athos were an important vehicle for transmission of Orthodox literature, art, and spirituality in the Orthodox world. Its libraries contain some of the greatest surviving medieval manuscript collections. Mount Athos survived the Ottoman conquest and was allowed to remain an autonomous community. Its monks still preserve the ascetic traditions of the past as a living inheritance from the Byzantine world.

expand farther into Europe. The second civil war was also a struggle between a wealthy aristocracy, represented by Cantacuzenus, and the urban poor, who temporarily controlled Thessalonica, the empire's second most important city. Religious controversy over Hesychasm, a contemplative practice that led to visions of the Divine Light, also split the contenders. When John V finally took undisputed rule of the empire in 1354, it was in desperate shape, and the impact of war was exacerbated by bubonic plague.

The remaining century of Byzantine history was a period of vassalage and appeals for help as the empire shrank to little more than the capital itself. John V Paleologus even traveled to Rome to personally accept the primacy of the pope without any resulting aid or true church union. In 1371 after the Ottoman defeat of the Serbs isolated Constantinople, John V Paleologus agreed to pay tribute to the Ottoman sultan. His son Manuel II Palaeologus (r. 1391–1425) traveled to

European capitals to ask for help, while the Turkish sultan Bayezid besieged Constantinople. The invasion by Timur-i Leng (Tamerlane) of Anatolia and his victory at Ankara in 1402 postponed the inevitable conquest for half a century. In 1438–1439, John VIII (r. 1425–1448), accompanied by the patriarch and leading clerics and scholars, attended a papal council in the Italian cities of Ferrara and Florence and signed a statement of union supposedly ending the centuries of schism, but even at this late date it was effectively opposed in Constantinople and throughout most of the Orthodox Christian East.

The final siege of an isolated and depopulated city took place in 1453 in a methodically planned attack by Mehmed II. The emperor Constantine XI (r. 1448–1453) and his citizens resisted for almost two months, helped only by volunteer Italian commanders, until a final Ottoman attack on May 28. Constantine led the defenders and was lost in the final assault, while a

last liturgy took place in Hagia Sophia. Symbolically, Mehmed entered the church and had a Muslim prayer proclaimed. The siege of Constantinople was remembered throughout the Christian world as a tragic yet noble end to an empire that had existed for more than a millennium.

The political failure of late Byzantium, however, overlooks the complexity of a period in which its territories were part of a thriving Mediterranean economy controlled by Italian merchants and in which mercenaries, marriages, alliances, and above all religion contributed to a multiethnic world where ideas, cultural products, and beliefs were formed and transmitted. Through these connections, Byzantium long survived its political existence.

The Byzantinized States of Eastern Europe

The Byzantine empire, though shrinking after 1125, extended its influence throughout Europe, particularly by significantly influencing the formation of Balkan and Eastern European states.

Byzantine emperors identified themselves as Romans (*Romaioi*) and their empire as the Roman empire, claiming a legacy back to Julius Caesar. Byzantium's longevity and this connection to Rome led the newly forming kingdoms of Europe to appropriate aspects of Byzantium's glory, prestige, and legitimacy for themselves. They did this by, among other things, appropriating titles, terminology, art, and architecture and through more physical connections, such as cultural exchanges and marriages.

Respect for Byzantium's heritage enhanced the Byzantine emperors' sense of their own imperial ideology, which originated with Constantine I (r. 306–337). He created a new imperial identity through Christianity, when the pagan idea of a god-emperor ceased to be looked on favorably due to increasing Christianization. According to this imperial ideology, there could be only one Christian emperor, who acted as God's vice-regent on Earth and to whom all other rulers were subordinate. Thus, Constantine and his successors referred to other Christian and non-Christian rulers as sons, using familial language as a way of asserting dominance.

Byzantium was a model for all of Europe, and its emperors' imperial ideology included the entire world, as is evident in the sixth-century *Barberini Ivory*, which shows the emperor (probably Justinian I) receiving homage and tribute from Central Asians and Indians, who are below his horse's hooves. Much closer to Constantinople, the areas most identified with Byzantine influence are Southeastern and Eastern Europe because of their conversion to Byzantine forms of Christian worship, customs, and belief. Most of the Slavic states in these regions were in close contact with Byzantium and attempted to emulate it.

The Balkans generated two of the most strongly Byzantine-influenced kingdoms: Bulgaria and Serbia. This was due largely to Byzantium's interest in protecting its borders in a region that it had previously controlled. The Balkans were also a borderland in which there were at least three competing foreign interests: Byzantine, papal, and German imperial. This is perhaps revealed most clearly in the religious-cultural split between Byzantinized Bulgarians and Serbs and Latin Croats and Slovenians.

The Bulgars, a non-Slavic, possibly Turkic-speaking people out of Central Asia, arrived in the Balkans in the seventh century, taking a portion of Byzantine territory for themselves and thus beginning 700 years of conflict. In the process of their settling down in the Balkans, the Bulgars were slowly absorbed culturally and linguistically by the Slavic majority, which had settled the region a century earlier, but Bulgar lords remained as a ruling warrior-elite. After over a

century of warfare, Byzantium used Khan Boris I's (r. 852–889) Christianization in 864 to gain control over the Bulgarian leadership. Boris solicited missionaries from the papacy, the German empire, and Byzantium and due to political factors aligned himself with the Byzantine Church and took the baptismal name Michael. The presence of Byzantine churchmen in Bulgaria under the control of the patriarch of Constantinople, however, was not acceptable, as the Bulgarian rulers desired autonomy and feared forced unification with Byzantium.

The two factors that brought religious autonomy to Bulgaria were the introduction of the Slavonic liturgy, originally created by Byzantine missionaries Cyril and Methodius, late in the reign of Khan Boris, and Boris's grandson's marriage to a Byzantine princess, which made the Bulgarian Church autocephalous (having its own head, or primate, who is not subject to any higher-ranking bishop) while also bringing increased Byzantine formulas, titles, and ceremonies into the royal court. This first Bulgarian empire was defeated by Basil II "the Bulgar-Slayer" (r. 976–1025), a Byzantine emperor who wanted to end the ever-present Bulgarian threat. The competition between Byzantium and Bulgaria was renewed after the extinction of Basil's line in the eleventh century and the creation of a second Bulgarian empire. For the next three centuries, Byzantium and Bulgaria warred over territory and influence in the Balkans, while Bulgarian rulers took the title of *tsar* in an attempt to appropriate the heritage of the caesars and become a new Byzantium.

The early Serbian states had to deal not only with Byzantium but also with a powerful Bulgaria. Serbian rulers, such as Michael of Zahumlje (d. ca. 945) and Časlav (r. 927/928–ca. 960), used Byzantinization, including conversion to Byzantine Christianity, to combat the Bulgarian threat. Stefan Nemanja (r. 1166–1196) unified and enlarged Serbia, aided by discord in Byzantium due to its conflict with rising Islamic powers in the Middle East and with Christian crusaders. Nemanja and his dynasty balanced Byzantine, papal, and West European alliances to solidify the dynasty's power and independence. Serbia's strength peaked with the rise of Stefan IV Dušan

➤ ALEXANDER "NEVSKY"

Alexander Iaroslavich (1220–1263), prince of Novgorod (r. 1236–1263) and later grand prince of Vladimir (r. 1252–1263), earned the nickname "Nevsky" (of Neva) with a victory over invading Swedes on the Neva River in 1240. He is well known today due to Sergei Eisenstein's 1938 film, which used Nevsky's life and myth to mobilize anti-German sentiment prior to the Molotov-Ribbentrop Pact of August 1939.

Nevsky ruled at a pivotal time in Russian history, leading Rus forces against the Livonian Sword Brothers, a branch of the Teutonic Knights, and Swedish crusaders, who were attempting to convert Rus to Latin Christianity and garner new territory. His greatest victory was the Battle on the Ice on frozen Lake Peipus in April 1242 fought against the Sword Brothers. He also faced a new threat from the east, the Mongols, who invaded in force in 1237 and destroyed the cities of Vladimir in 1238 and Kiev in 1240. Nevsky allied with the Mongols rather than fight them, a move that he viewed as the only way to preserve his people and consolidate his power. The tactic was a success. The Mongols ultimately supported his claim to the throne of Vladimir, making him the undisputed ruler of Rus. The Russian Orthodox Church canonized him as a saint in 1547, and his successors ruled Russia until the end of the sixteenth century. The results of his actions, however, increased the separation between Russia and the West, changing the future of Europe.

—Christian Raffensperger

(r. 1331–1355), who capitalized on internal strife in the region to build Serbia into a major power and take the title of "Tsar of the Serbs and Greeks" in 1345. Like the Bulgarians before him, Dušan used modified Byzantine titulature and ideology to create a Byzantine-style empire, and he even expressed a desire to capture and rule from Constantinople, a dream cut short by his death.

The rulers of Kievan Rus (the medieval kingdom that is the ancestor of modern Ukraine, Belarus, and Russia) of the ninth and tenth centuries played the parts of raider, mercenary, and trader with Byzantium. The closest relationships

were created, however, via Christianization, beginning with the conversion of the regent Olga in the mid-tenth century. Though her son remained pagan, Olga's grandson, Vladimir (r. 978–1015), converted to Byzantine Christianity to marry Anna, sister of Basil II, and converted Rus in his wake. The relationship created via conversion was Byzantium's strongest tie to Rus. Politically, Rus largely chose other paths in order to assert its position in Europe, but the growing power of the Christian Church in Rus as well as the fragmentation of the kingdom into warring principalities helped increase Byzantinization beginning in the twelfth century. This continued in the thirteenth century with two specific events. The first was the growing feeling in the Latin Church that Byzantine Christianity was heretical, making it the object of crusades, including the Fourth Crusade that sacked the Byzantine capital of Constantinople in 1204 and the Livonian Sword Brothers' ill-fated crusade against Novgorod in 1242. The second event was the Mongol invasion in 1237 that subjugated Rus, making the kingdom the westernmost part of the Mongol world rather than the easternmost part of the European world. These events strengthened Byzantine ties, which were used to the advantage of the growing power of Moscow in the fourteenth and fifteenth centuries, when its rulers began to appropriate the Byzantine mantle for themselves, including using the title of tsar.

Sacred and Secular Authority in the Latin West

By 1048, the Holy See of Rome, with imperial support, had escaped domination by the Roman nobility. Pope Leo IX (r. 1048–1054) and his successors encouraged reform, prohibiting the sale of ecclesiastical rites and offices (simony) and clerical concubinage. This renewed papacy struggled with the patriarch of Constantinople over issues of theology, liturgy, and authority. The result was a growing schism that progressively divided the Churches of Rome and Byzantium. Starting with Gregory VII (r. 1073–1085), reforming popes also openly opposed the German emperors by resisting imperial promotion of bishops. This opposition led to a temporary papal triumph in 1077 when Henry IV begged the pope to absolve him from excommunication. The empire, however, regained the initiative, and a long struggle ensued. It was resolved by compromise in the Concordat of Worms (1122), which left emperors able to regulate ecclesiastical elections but without appearing to bestow spiritual power on new bishops.

The struggle with the Western empire, which was centered in Germany and northern Italy, led the papacy to seek allies, with popes often supporting fractious nobles within the empire. Additionally, popes claimed the authority to review and confirm imperial elections. Outside Germany, popes encouraged the emergence of strong kings. These included William of Normandy, who conquered England in 1066, and the Norman rulers of southern Italy.

Part of the new papal program and self-image was presenting itself as the defender of all Christians. In an attempt to aid Eastern Christians against the onslaught of the Seljuk Turks and to restore full ecclesiastical relations with the Eastern Roman, or Byzantine, empire, Pope Urban II (r. 1088–1099) launched the First Crusade in 1095–1096. This effort to domesticate violence in the Church's cause was only intermittently successful. The Fourth Crusade, which ended in the sack of Constantinople (1204), only further embittered East-West relations. The Eastern emperors regained the city in 1261, but they were unable to control anti-Latin sentiment. Even the threat of Turkish conquest was insufficient

to earn widespread support for imperial efforts at ecclesiastical reunion. The agreement reached at the Council of Florence (1439) failed through widespread resistance of both clergy and laity in Constantinople's remaining territories. The Turkish capture of the city in 1453 only served to cement separation of East and West.

In the West, the Salian dynasty, which had imposed reform on Rome and then quarreled with the papacy, died out in 1125, but imperial authority was reasserted by the Hohenstaufen family in the later twelfth century. The campaigns of Frederick I Barbarossa (r. 1152–1190) drove the papacy into alliance with the city-states of northern and central Italy. Barbarossa failed to control Italy, but Frederick II (r. 1212–1250), his grandson, inherited a combined claim to the empire and the Norman kingdom in Sicily and southern Italy. At first, Frederick's minority, dependent in part on Pope Innocent III (r. 1198–1216), defused this threat to papal autonomy. Later Frederick proved too powerful, and successive popes fought against him but with little success. After Frederick's death in 1250, a new papal champion, Charles of Anjou, brother of King Louis IX of France, managed to oust the Hohenstaufens from southern Italy and Sicily, but this left Rome under the thumb of another political power, Angevin Naples.

Earlier, Pope Innocent III had exercised more political power than most popes, even bringing King John of England to swear allegiance to the Holy See. Other kings were less submissive, but they were often unable to ignore Innocent's combination of moral authority and political pressure. His claims to represent a vastly superior authority, that of Jesus whose vicar, or deputy, he claimed to be, and to exercise ultimate authority over all matters "by reason of sin" (namely, by virtue of his supreme priestly power to judge sins) gave the pope considerable moral authority. Under his thirteenth-century successors, however, this prestige declined, and the kings whom papal Rome had once favored became potential enemies. This sea change culminated in an attack at Anagnini in 1303 by French agents on Pope Boniface VIII (r. 1294–1303), then at odds with the Capetian king of France, Philip IV. Thereafter the papacy, whether present in Rome or resident at Avignon (1309–1377 and 1378–1417),

➤ *SOLITAE*—POPE INNOCENT III WRITES TO THE EMPEROR OF CONSTANTINOPLE

In late 1200, Pope Innocent III sent the letter *Solita* (named for its opening word, which means "usual") to Emperor Alexius III (r. 1195–1203) in response to Alexius's claim that imperial power was superior to that of priests. The pope's rejoinder was such an unambiguous and original articulation of the primacy of papal power that it became enshrined in the canon law of the Roman Church.

"You ought to know that God made two great lights in the firmament of heaven—the greater light to preside over the day, the lesser light to preside over the night. . . . The word 'day' we understand to mean 'spiritual,' and 'night' means 'carnal.' . . . He [further] instituted two dignities, which are pontifical [papal] authority and royal power. The one that rules over days, that is over spiritual matters, is greater; the one that rules over nights, that is over carnal matters, is lesser. Thus, it is recognized that the difference between the sun and the moon is as great as that between pontiffs and kings."

—Thomas M. Izbicki

was treated by rulers, be they friend or foe, like any other prince. The English Crown went so far, at the height of the Hundred Years' War, as to forbid appeals from English clerics to the pope.

Despite this weakening, the papacy maintained high claims to temporal power. Boniface VIII even declared subjection to Rome, exact meaning undefined, to be necessary for salvation. These claims aroused opposition from writers such as Dante Alighieri, who defended imperial power, and Marsalis of Padua, who denied that the clergy could have coercive power. A different challenge, arising from the Great Western Schism (1378–1417) and known as Conciliarism, treated general councils as the true representative of the infallible Church and as the sole body that had the power to regulate and to sit in judgment of popes. Conciliarism benefited the

princes, who were able to extract concessions from the popes who sought their support against the Conciliarists. Ultimately Conciliarism lost out, but the papacy did not emerge unscathed. Popes retained their theoretical claims to universal supremacy over the Church, but in reality by the end of the fifteenth century they had become little more than Italian princes ruling over the Papal States of central Italy. At the same time, these popes were still able to wring large sums of money from various Europeans north of the Alps, especially in Germany, whose princes conspired with papal agents. Reactions against this “foreign” Roman power were among the factors permitting the Protestant Reformation to triumph in various areas in the North.

National Monarchies and Representative Assemblies in Europe

Around the year 1000, land and therefore power was held by kings, dukes, counts, barons, and viscounts; even archbishops, bishops, abbots, and abbesses were lords who held land and exerted considerable power. Although in theory the king was the greatest lord in the land, and all other lords held their land from him, in practice the king was often unable to exert influence over lords in his kingdom. However, beginning around the mid-eleventh century, especially in France and England, kings began to consolidate their power at the expense of the local lords, a process that eventually led to the growth of national monarchies. As the complexity of royal government grew, kings in various parts of Western Europe, beginning with the Spanish kingdom of León in 1188, began to call representative

assemblies of lords and commoners to gain the consent of the realm for various projects, such as levying taxes or mobilizing consent for royal policies. Their objective was not to share power but instead to gain widespread support that reached from the highest to the lowest levels for an ever-expanding growth of royal power.

For the central monarchy to assert authority over powerful lords, kings used two interconnected strategies. First, they extended the machinery of royal government into the provinces, the seat of local baronial power. Second, kings obtained baronial loyalty and support for their authority through a variety of means. In England, the impetus toward consolidation of monarchical power grew from the conquest of Anglo-Saxon England by William, Duke of Normandy, in 1066. With his successful conquest, William I (r. 1066–1087) became the king of England, a kingdom that already had sophisticated governmental structures. To secure his conquest and to reward the knights who had fought for him, William gave out parcels of land as fiefs that were held in exchange for the knights’ loyalty and service to the king, thereby displacing most of the defeated Anglo-Saxon landholders with men who were loyal to him. Furthermore, William demanded that all nobles and knights swear an oath of loyalty to him and recognize him as the sole ruler of England.

In the twelfth century royal power was extended further into the provinces when King Henry II (r. 1154–1189) expanded the number of criminal cases tried before the king’s court and initiated legal procedures that took property cases away from the courts of local lords and gave them to the royal courts, thereby expanding royal authority and increasing royal revenues at the expense of the barons of the realm. However, during the reign of King John (r. 1199–1216), many English barons expressed their dissatisfaction with royal heavy-handedness. They rose in rebellion and forced John to agree to the *Magna Carta* (Great Charter, 1215), which guaranteed feudal liberties by articulating royal and baronial responsibilities and obligations.

Institutionalized representative government in England emerged during the reign of Edward I (r. 1272–1307) in response to Edward’s need for revenue. The word “parliament” (from the Old

French verb *parler*: the place where discussion took place) had always been used to describe meetings of the king's Great Council, in which barons and important churchmen of the realm met to give the king advice and to adjudicate important cases. However, in 1295, driven by his need for revenue, Edward summoned two knights from every county and two burgesses (towns-men) from every borough (town or city) to meet with the Great Council to consent to a new tax levy. Although Edward did not know it at the time, he had called the first Parliament, which came to be comprised of two representatives from each borough and county plus the great barons and ecclesiastics in the realm. Over time these groups separated into the House of Commons (the burgesses and the knights) and the House of Lords (the barons and ecclesiastical lords). As time went on, the Parliaments of the English kings consented to taxes, discussed politics, passed laws, and handled important legal business, including removing several unpopular kings, with the first parliamentary participation in a royal deposition taking place in 1399.

In France, royal consolidation faced similar challenges as in England: how to overcome the power of the lords without losing their support. In 987 the nobles of France chose Hugh Capet as king (r. 987–996), establishing a royal dynasty, known as the Capetians, that produced an unbroken line of kings down to 1328. The early Capetians were kings in name, but in fact they did not wield power beyond the royal *demesne*, a small territory around Paris known as the Île-de-France that he inherited and ruled directly as a feudal lord, because the great lords of France, such as the dukes of Normandy, Brittany, and Aquitaine, were more powerful than the king himself. They technically owed allegiance to the king as their overlord, but in practice the king had no way to enforce his authority in the lands of these men because the machinery of royal government was weak, and he had no way to administer justice or collect taxes beyond his *demesne*.

This situation began to change significantly in the reign of King Philip II Augustus (r. 1180–1223), who successfully waged war with the English kings who also held the French territories of Normandy, Maine, Anjou, and Aquitaine by right

➤ KING EDWARD I SUMMONS A PARLIAMENT

In 1295, Edward I of England, facing crises on several foreign fronts, realized that he would need to raise a massive amount of financial support from his English subjects. To that end, he decided to convene a larger-than-usual Parliament at Westminster, by including in this assembly two representatives each from every town, city, county, and borough. The following document, to the sheriff of Northamptonshire, stipulates precisely what is expected of these knights and burgesses—the commoners—and suggests why the king decided that such representatives would best serve his ends.

“The said knights are to have full and sufficient power . . . for the community of the aforesaid county, and the said citizens and burgesses for . . . the communities of the aforesaid cities and boroughs . . . for doing what shall then be ordained according to the common council . . . so that the aforesaid business shall not remain unfinished in any way. . . .”

of feudal inheritance. By taking most of these lands in France away from King John of England, Philip II gained considerable territory for the French monarchy, and he asserted his royal authority in the newly acquired territories by sending in royal administrators to collect taxes and render royal justice. Throughout the thirteenth century, French kings continued to bring additional territory under royal influence by military conquest, diplomacy, or strategic marriages.

French royal power was reinforced considerably in the reign of Philip IV (r. 1285–1314). He strengthened the royal bureaucracy and brought a representative body together in 1302 that consisted of representatives from the three estates, or classes: the clergy (the first estate), the nobles (the second estate), and townspeople (the third estate). This body, known as the Estates-General, had little formal power and was called to give

sanction to Philip's domestic and foreign policies. Almost five centuries later, however, the Estates-General would spark the French Revolution of 1789.

Other European polities also summoned assemblies to affirm monarchical agendas. For instance, in the Germanic and Italian lands east and south of France, which came to be called the Holy Roman Empire, the king and emperor Frederick II (r. 1212–1250) called the Council of Melfi in 1231 to exact recognition of his sovereignty over his nobles in Sicily and southern Italy and to enact a new code of legislation. Yet the Holy Roman Empire illustrates that the rise of the national monarchies in Europe was neither inevitable nor unvarying. Through the course of the eleventh century, the German kings had begun to develop a strong monarchy, but two German kings from the Hohenstaufen dynasty, Frederick I (r. 1152–1190) and his grandson Frederick II, tried to enforce their overlordship in Italy with disastrous results. Frederick I saw the wealthy northern Italian city-states as a valuable source of revenue, but when he tried to assert German dominance in Italy, he was defeated in 1176 by a coalition of northern Italian cities in Lombardy that had developed a strong tradition of independence, with support from the papacy. As a result, Frederick recognized the rights of the northern Italian cities to freely elect their own town magistrates, a type of government called a commune, although the Italian communes still acknowledged that they were imperial agents and paid a large annual sum for the exercise of imperial justice.

Frederick II had inherited the kingdom of Sicily and had ambitions to create a strong central state in northern and southern Italy. However, he ran into stubborn resistance from the papacy, which feared that a strong single state uniting northern and southern Italy would weaken papal power in its central Italian territories, called the Papal States, and from the northern Italian cities, which did not want to surrender their independence. In 1231, the same year he issued the *Constitutions of Melfi*, Frederick promulgated the *Constitutions in Favor of the Princes* in which he conceded to each of the important German barons sovereignty in their own territories, effectively declaring that Freder-

ick's energies would be directed toward creating a strong central monarchy in Italy and that its princes would rule Germany. Although Frederick won many battles to secure his Italian state, he was ultimately defeated in northern Italy. The German emperors' struggles in Italy had very important consequences. By devoting attention to their failed Italian ambitions, the German emperors largely had ignored their lands in Germany, and many German lords developed independent principalities, thereby leaving the German monarchy weak and unable to centralize its power. Throughout the later Middle Ages, therefore, neither Germany nor Italy developed strong national monarchies, and they were not unified until the second half of the nineteenth century.

What a Difference Two Generations Make—Louis IX and Philip IV of France

During the reigns of the French kings Louis IX (r. 1226–1270) and his grandson Philip IV (r. 1285–1314), the consolidation of monarchical power proceeded apace. Both were capable kings who commanded the respect of their contem-

poraries, whether ally or enemy. Only 15 years separated their reigns; nonetheless, their challenges and responses were strikingly dissimilar.

By most surviving medieval accounts, Louis IX (canonized as St. Louis in 1297) was a king who exhibited bravery, honor, piety, and generosity. Known for his even-handed justice, Louis extended royal justice but also demanded fairness and balance from royal agents. To this end, he sent out traveling agents of the Crown known as *enquêteurs* who were instructed to investigate abuses committed either in the name of the king or by local officials. He also encouraged vassals of lords, even if they were outside of the royal demesne, to appeal to the royal courts if they felt that their lords had not treated them justly. As a result there was an influx of judicial business before the royal courts, and to cope with the increased load Louis established a regular permanent court (as opposed to the itinerant traveling court of his predecessors) manned by a professional staff of jurists. During Louis's reign, this court of final appeal became known as the Parlement (not to be confused with the English representative assembly known as Parliament), and it expanded the machinery and authority of royal government. Furthermore, Louis, himself a distinguished crusader, detested warfare between Christians and forbade his barons from engaging in private warfare. Louis was a pious and unwavering ally of the Church and defender of the clergy, but on several occasions he refused to bring civil sanctions against persons whom he was not convinced had been legitimately excommunicated by the Church. In short, Louis was preoccupied with doing justice and establishing a just society.

Philip IV le Bel (literally "the Handsome" but translated into English as the ambiguous "the Fair") also worked to extend royal power. Philip continued to enforce the prohibition of private warfare and to encroach on noble jurisdiction. Due to the rise in judicial business, the Parlement was enlarged into three sections, the *chambre des plaids*, which heard cases; the *chambre des requêtes*, which decided if complaints should be heard; and the *chambre des enquêtes*, which was a permanent body to conduct investigations. As royal authority grew, Philip needed to improve accounting of royal revenues, which had not

➤ LAWYERS GONE WILD—THE CHARGES AGAINST POPE BONIFACE VIII

In his struggle with Boniface VIII, Philip IV unleashed his lawyers. At a meeting of the royal council in 1303, these royal advocates presented a list of accusations regarding the pope's supposed heresies, sins, and crimes. As is often the case when the Big Lie is employed in political rhetoric, the charges were meant to rally public support rather than to serve as a sober bill of indictment. The following are only a few of the more lurid charges.

"He does not believe in the eternal life to come. . . . He is reported to say that fornication is no more a sin than is rubbing one's hands together. . . . He has a private demon whom he consults on all matters. . . . He is guilty of sodomy. . . . He has had many clerics murdered in his presence, taking joy in their deaths. . . . He seeks not the salvation of souls but their damnation."

changed much since the days of Philip II Augustus (r. 1180–1223). Philip IV le Bel created a permanent financial body known as the *chambre des comptes*, staffed with professional bureaucrats, and moved the royal treasury into the Louvre, the royal fortress in Paris. Therefore, under Philip, much more than under Louis, royal government became institutionalized and staffed by permanent personnel; the operation of government became routinized and was no longer dependent on the talents of an individual but instead depended on a cadre of trained professional bureaucrats, many of them educated as lawyers.

On the other side of the coin, Philip did not share his grandfather's comfortable relationship with the Church. The order of the Knights of the Temple, a crusading order, was attacked and dissolved after Philip accused it of a string of sordid crimes. Moreover, with sanction from the Estates-General, Philip asserted and defended the

supremacy of royal over ecclesiastical rights in France and even had royal agents travel to Rome to impose, by force if necessary, Pope Boniface VIII's (r. 1294–1303) acquiescence. Philip's men handled Boniface roughly, and some medieval commentators blamed Philip for Boniface's death soon after. Therefore, in Philip's reign much more so than in Louis's, one can glimpse the germ of the rise of the absolute monarchy and the indomitable government bureaucracy run by persons loyal only to the Crown that would characterize the postmedieval period.

Western Europe—City-States and Regional Principalities

The fragmentation of Europe throughout the Middle Ages due to the devolution of power at the expense of centralized monarchies, the conflict between the Church and various monarchies, and the autonomous character of city-states created by commerce was responsible for the multiple political entities that existed from 1000 to about 1500. Principalities, bishoprics, imperial cities, and city-states, among others, were examples of the sort of smaller political structures that spanned Europe, especially within the German-Italian regions that later constituted the Western empire, known as the Holy Roman Empire from the mid-twelfth century onward. First divorced from central monarchies and then largely subsumed by modern nation-states in a later period, these small territorial entities represented a period in European history illustrative of auto-

nous polities ruled by princes, dukes, margraves, mercantile oligarchies, and high clergy.

The Western empire's very existence as a meaningful political entity was contingent on the ability of its leaders to maintain military superiority over enemies and vassals alike. However, the collapse of the Carolingian empire and the severe weakening of the Holy Roman Empire after 1250 were a result of the inability of both to maintain control over the political destinies of their lands and peoples and the lords who owed the emperors presumed fealty. The basis of feudalism relied on the loyalty that a vassal held toward his lord in his provision of military service when necessary. The process of gradual evolution from holding a fief in precarious tenure and solely at the lord's pleasure to holding a fief by right of inheritance created many a schism between a lord and his vassals within the Western empire from the lowest to the highest levels of authority. By the late eleventh century, many vassals were reluctant to follow the policies of their lords when they did not benefit their interests. As a result, Western emperors frequently quarreled with their vassals as they attempted to assert control over them. Moreover, many regional princes and bishops acquired substantial territories and wealth rivaling that of their lord monarch. At times this allowed lords and even so-called imperial cities to extract concessions from their monarch in the form of exacting greater autonomy (such as Emperor Frederick II's *Constitution in Favor of the Princes* of 1230), more agency in monarchical policy, or even making the office of emperor an elective position contingent on the wishes of prince-electors, who were the more powerful dukes, archbishops, and lords.

In contrast with events in central Europe, the emergence of national monarchies in England, France, the Scandinavian states, and the Iberian states, such as León-Castile, was based on the centralization of royal power. This process was largely due to royal-ecclesiastical cooperation and royal control over many aspects of national or territorial churches. It was the empire that ultimately suffered from conflict with the Roman Church and was ultimately emasculated by the late thirteenth century. The Church's struggle with the Holy Roman Empire further eroded im-

perial political control and augmented that of the smaller political structures within the empire. Already splintered by localism, ethnic divisions, and the nature of feudalism, this conflict propelled further the devolution of imperial power since these smaller principalities, city-states, and bishoprics threw in their lot with whatever larger political entity would prove beneficial to their own growing autonomy. After more than a century of disputes and even wars between the Roman Church and the Western empire over such issues as investiture, control of the Italian cities, and ecclesiastical jurisdiction as well a series of struggles between the Welf and Hohenstaufen families for control of the imperial Crown, the thirteenth century witnessed a significant increase in the autonomy of German and Italian principalities and city-states. The already semi-autonomous commercial cities within the Western empire augmented their control over their destinies due to these conflicts, and clerical and lay lords alike switched their loyalties to whichever side or imperial claimant promised them more land and more influence.

In the twelfth century, for example, the conflict between the Hohenstaufen emperor Frederick I Barbarossa (r. 1152–1190) and various popes, especially Alexander III (r. 1159–1181), weakened the power of the emperor, as some of his subordinates, especially the commercial cities of Lombardy, sided with the papacy to further chip away at the political strength of their sovereign. In response to Barbarossa's excursions into Italy, various Italian cities converged into an alliance known as the Lombard League in defense of the cities of Lombardy. By 1183, the Lombard League had won its *de facto* independence from imperial control, although the cities' officials acknowledged that they ruled as imperial agents, and the cities agreed to pay large annual subsidies to the Crown for the privilege of exercising imperial jurisdiction over their own affairs. In essence, imperial influence over northern Italian affairs had been seriously eroded but not totally destroyed. That would only come after 1250 and the death of Barbarossa's grandson, Frederick II (r. 1215–1250).

The commercial cities of the Hanseatic League in Germany also emerged as powerful political centers splintered from the Western empire. The

formation of these cities along vital waterways and trade routes allowed the mercantile classes to acquire substantial fortunes and ensured political control of the destinies of their cities. Indeed, the growing political class that emerged from the mercantile class was crucial in developing the autonomy and economic power of the Hanseatic, Italian, and Low Countries' city-states. Venice was tightly controlled by the leading merchant families, which ensured its development of a formidable naval capacity to protect its commercial links and trade. Genoa, Pisa, and Florence had similar merchant-controlled political structures. The Hanseatic League also ensured tight political control over its allied cities' destinies in order to protect their wealth and commerce from the grip of princes and emperors, who were always eager to tax them to augment their political power. The nascent cloth trades in the Low Countries also encouraged the local merchant class to develop strong city-state polities, such as the city of Ghent. The threat of French royal incursion encouraged Ghent to seek alliances against its more powerful neighbor to ensure its autonomy, often turning to England in this regard. The growing loyalty of local populations to their city-state rather than to any sovereign allowed them to fight against

Holy Roman Emperor Frederick I Barbarossa receives the Venetian ambassadors, from the Codex Correr, fourteenth century. Frederick I spent decades in the twelfth century battling the authority of the papacy in northern Italy, a battle concluding in the Peace of Venice in 1177. (Art Resource, NY)

➤ BLESSED LADY SPAIN

Around the year 1240, the canon lawyer Vincentius Hispanus (Vincent the Spaniard, d. 1248), in one of his most famous legal opinions, offered a ringing declaration of Spanish sovereign rights within greater Christendom. By “Spain” he meant the entire Christian Iberian Peninsula, which at that time was divided into four independent kingdoms: Castile-León, Navarre, Aragon, and Portugal. To their south lay the emirate of Granada, the last remnant of Muslim authority in Iberia.

“[According to Johannes Teutonicus (John the German, d. 1253)] no kingdom can be excluded from the empire, for it would be headless and without a head it would be a monster. . . .

Make an exception, O Johannes Teutonicus, for the Spaniards who are exempted by the law itself and who barred the way to Charlemagne and his peers. I, Vincentius, say that the Germans have lost the empire by their folly. Every city contends with them for independence and every hut usurps lordship for itself. Only the Spaniards have ac-

quired an empire by their valor, and they too have chosen bishops. . . . [Is it not known] in France and England, in Germany and Constantinople that the Spaniards rule blessed lady Spain, that they brought this lordship into existence and, as lords, are expanding it by their virtues of boldness and probity? The Spaniards then are supported by their merits and worth; and like the Germans they do not lack a body of prescripts and customs. Who can number your praises, O Spain?—rich in horses, famous for food, shining with gold, slow to retreat, prudent, the envy of all, versed in the laws and standing high on sublime columns.”

Vincentius Hispanus, gloss on *Decretales*, 1.6.34 (ca. 1240), ed. G. Post, *Speculum* 29 (1954): 206, translated in Brian Tierney, *The Crisis of Church and State, 1050–1300, with Selected Documents* (Englewood Cliffs, NJ: Prentice Hall, 1964), 162.

encroachments on their respective city-states’ autonomy, as the Flemings demonstrated on July 11, 1302, when the combined urban militias of Bruges, Ghent, and other Flemish towns destroyed a powerful invading French army, composed largely of feudal contingents, at the Battle of the Golden Spurs.

The complications created by feudalism begat further problems when sovereigns who were vassals to other sovereigns sought to demand greater autonomy or even competed for the Crown of their lord. Since the Norman conquest of England in 1066, the issue over English territories in France exacerbated many of the problems that existed between these two kingdoms. As French vassals, English kings had to pay homage to their French overlord for territories in Normandy, Aquitaine, and Gascony. As powerful kings in their own right, English kings often came into conflict with their French lords. King John (r. 1199–1216) lost most of England’s possessions in France but retained Gascony in the south, which would prove to be a bone of contention in future English-French issues. The Hun-

dred Years’ War (1337–1453) ignited when King Edward III of England (r. 1312–1377) claimed the French Crown, which led to a century of warfare that assisted in the beginning of the long-term process of royal centralization in both kingdoms. The English Crown proved successful in centralizing its political hold within England and much of the rest of Britain, ultimately achieving this with the end of the Wars of the Roses in 1485. Developments in France furthered the centralization of power of the monarchy and the expansion of the royal domains surrounding Paris. However, these twin processes were rather complicated by the fact that major vassals continued to vie for power at the expense of the monarchy and were successful at pitting their forces against the ever-encroaching power of either the French or English Crown.

Scandinavia—A Special European Experience?

Around the year 1000, Scandinavian kings traveled from estate to estate in order to assert their power, and it was only from the thirteenth century onward that they settled in permanent capitals. The core of their military organization as well as civil administration was the *hird*, a body of personal retainers often called *housecarls* (house men). In times of war they could also call on the *leidang*, a conscripted naval force, and frequently also a *landvern*, a peasant militia. In Sweden and Denmark cavalry became the major component of their military forces at the end of the thirteenth century.

Viking kings had to be accepted by regional parliaments. During the eleventh century the Council of Noblemen in each kingdom emerged as the most important body for sanctioning the enthronement of kings. Later, and very much as in contemporary England, kings also had to present a written charter to the Council in which they stated the parameters of their rule. Generally, the Scandinavian monarchies did not become fully hereditary until the mid-sixteenth century.

The Roman Church was another major force in both politics and everyday life in pre-Reformation Scandinavia, and monarchy and church enjoyed a symbiotic relationship. Early Scandinavian Christianity was first put under the patronage of the archbishop of Bremen in northern Germany. The archbishopric of Lund in southern Sweden, founded in 1060 by the Danish king who then controlled Sweden, became the religious center of northern Scandinavia from 1103. Local saints were also important. The grave of King Olaf Haroldson (d. 1030) became a major pilgrimage site, and a cathedral was raised over his grave at Trondheim. His cult became the basis for the archbishopric of Nidaros, founded in 1152. Sweden got its own archbishopric in

Uppsala in 1164, and St. Brigitte (1303–1373) became the national patron saint and the basis for a powerful religious order.

At the end of the Viking era, central power was considerably weaker in Sweden than in Norway and Denmark, and the country was only unified around 1000. Christianity was introduced under King Olaf Skiötkonung (r. ca. 995–1022), but he had little power to counter non-Christian opposition, which was especially strong among the Svear, a tribe of central Sweden that gave its name to the land, while the Goths to the south accepted the new faith more readily. Various clans as well as foreign interests played their part in the succession process, and from 1130 to 1250 the families of Sverker and Erik were the major contestants. Under Earl Birger, acting as Lord Protector (1248–1266), unity was restored, and Sweden expanded to the north and into Finland. Birger also became ancestor to the royal house of Folkunge, which reigned until the Union of Calmar of 1397 (dissolved in 1523) that united Sweden, Norway, and Denmark under a single king while retaining their individual identities.

Christianity had been introduced to Finland already in the eleventh century, partly from Scandinavia but also from Orthodox Christian Novgorod to the east. During the twelfth century three waves of Swedish crusades consolidated its position but also placed Finland under the Swedish Crown, and many ethnic Swedes settled in the southwestern region of the country. The first Finnish bishopric was founded at Åbo in 1209. The Russians made several incursions but were forced back by the Swedes, who expanded farther into Karelia to the south and east. Here, Viborg was founded in 1293. The Peace of Nöteborg consolidated Swedish control in 1323.

In 1050 Norway stretched south to modern Gothenburg and also included Jämtland and Herjedalen (Swedish from 1658), the Faeroe Islands, Shetland, and the Orkneys. The Hebrides and Man were also part of the Norwegian empire between 1100 and 1266, as was Greenland from 1261 and Iceland from 1262. Norway entered a time of civil war and unrest from 1130 to 1227. State building picked up again in the latter half of the thirteenth century. A universal civil code was introduced in 1274, and reforms in 1308

► THE HANSA IN SCANDINAVIA

The state has not always been the sole sovereign political entity in the Western world. Before 1200, weak central power allowed the church and feudal lords autonomy from kings and emperors. This also enabled merchant guilds to dominate the politics of many medieval towns. Beyond that, a confederation of self-governing guilds known as the German Hansa or Hanseatic League, which controlled various maritime towns in northern German and neighboring regions, became a major power in the Baltic-North Sea area between 1200 and 1600. *Hansa* meant “association” in medieval German, and the word came to mean “a syndicate of commercial guilds or towns.” The Teutonic-speaking regions of northern medieval Europe witnessed a number of *hansas* from the eleventh century onward, but the Hanseatic League dominated northern maritime commerce and played a major political and military role in Scandinavia.

In the latter half of the thirteenth century the Hansa gained control over the profitable dry fish trade in Norway and soon established the so-called German Office in Bergen. Its financial power led the Norwegian king to grant the Hansa extensive privileges in 1343. Violence and abuse by the Germans, whose power threatened the Crown, led to discontent among the Norwegians. In 1367 war broke out between Denmark-Norway and the Hansa, but the latter managed to defend its position.

In the thirteenth century the Hansa also established itself in Stockholm, Sweden, from which copper, iron, butter, and hides were exported. The Hansa gained an export monopoly and exemption from customs tariffs when it funded Gustav Vasa’s liberation of Stockholm from the Danes in 1523. Its interference in Scandinavian politics, however, ended when Denmark-Norway and Sweden united in crushing the Hansa in 1534–1536. Ultimately, the Hansa could not compete with the growing organizational skill and resources of these emerging nation-states; its power vanished as modern states emerged. The Hansa was essentially dissolved during the Thirty Years’ War (1618–1648), with its last official assembly held in 1669.

—Frode Lindgjerdet

strengthened the king’s control. The relationship between church and the Crown also received a codified form in 1277 with the Accords of Tunsberg, which granted the former extensive autonomy.

In addition to its present-day territory, medieval Denmark also included the southern tip of present-day Sweden and the Duchy of Holstein to the south. Various parts of the southern rim of the Baltic and the Island of Gotland were also periodically under Danish rule. Denmark too experienced a civil war around the mid-twelfth century that also coincided with an agrarian crisis. In 1154–1157 Valdemar the Great succeeded in eliminating his rivals to the throne and consolidated Denmark’s southeastern borders against pagan Slavic tribes. His son Valdemar II continued the expansion, and in 1219 Estonia fell under Danish control, which lasted to 1346.

During the fourteenth century, dynastic policies of the royal families eventually led to Scandinavian unification. The young Olaf Haakonson, heir to the Norwegian throne, became king of Denmark in 1375 and king of Norway in 1380. Real power lay, however, with his ambitious mother, Queen Margareta I of Denmark. When Olaf died in 1387, Margareta was declared “Denmark’s mistress and master” by the nobility. She continued the process of Scandinavian unification, and in 1388 the Swedish aristocracy hailed her as regent as well. Margareta’s gender precluded her from formally becoming the reigning monarch, and in 1395 her nephew Eric of Pomerania was crowned king of Norway and the following year also of Sweden and Denmark. In 1397 the Treaty of Calmar formalized the union among Norway, Denmark, and Sweden.

A series of wars with the powerful Hansa soon led to uprisings against the union by the Swedish aristocracy from 1434. In 1523 the victorious Gustav Vasa entered Stockholm and was crowned king of Sweden. Frequent wars over hegemony in Scandinavia would continue to mark the relationship between the two kingdoms until the end of the Napoleonic Wars. The crisis following the Black Death decimated the Norwegian nobility as their already meager income fell. In 1397 the seal of the realm was transported to Copenhagen, and Norway became a Danish dependency, formalized by the Charter

of King Fredric III in 1536. The representatives of the Norwegian church were an independent force for some time, but that was also eliminated with the Reformation and the triumph of Lutheranism as the official state religion in 1537.

In 1362 Finland became an integral part of Sweden, with Finns receiving the same judicial and political rights as Swedes. Finland also followed Sweden into the Union of Calmar and, like Sweden, later embraced Lutheranism in 1527. Scandinavia saw a general strengthening of central political power, of which the dynastic unifying of the region could be seen as an integral part.

The Crusader States—Europe's Levantine Colonies

Between 1098 and 1109 the armies of the First Crusade (1096–1102) carved out four states in a region that Latin, or Western, Europeans came to know as *Outremer* (across the sea). The lands of Outremer today lie in southeastern Turkey, Syria, Jordan, Lebanon, Israel, and areas subject to the Palestinian Authority. All four crusader states—the county of Edessa (1098–1150), the principality of Antioch (1098–1268), the kingdom of Jerusalem (1099–1291), and the county of Tripoli (1109–1289)—served as cultural and commercial links between Western Europe and the lands and peoples of the Levant, or the Eastern Mediterranean, and beyond. They were also vexing reminders of the invasion and occupation of lands sacred to Islam and therefore the cause for periodic calls for jihad, or holy struggle, against the Western colonists, or *Franj* (Franks) as they were known.

By 1291 the last vestiges of the four original crusader states had been swept away. However,

other, newer crusader states in the eastern Mediterranean persisted into early modern times. Most notable were the kingdom of Cyprus (1191–1571), which Richard the Lionheart captured from a Byzantine overlord while on the Third Crusade (1188–1192); the principality of Achaia (1205–1432), also known as the Morea, which was located in southern Greece and was conquered in the wake of the Fourth Crusade (1202–1204); and Rhodes, the island headquarters of the Knights Hospitaller from 1309 to 1522. All three states were conquered by the Ottoman Turks between 1460 and 1571.

The colonists who settled these states brought with them ways of life and government that differed substantially from the traditions of the Levant, and probably very few were initially sympathetic toward the alien cultures they encountered. Circumstances, however, required

them to fashion a Franco-Levantine culture that adopted many Eastern Mediterranean features. Edessa had been an Armenian Christian state prior to its takeover by Baldwin of Boulogne in 1098. Because Baldwin and his successors presented themselves as the legitimate heirs of the former Armenian prince of Edessa, the county's Frankish lords adopted many Armenian institutions. Moreover, because so few Latin colonists took up residence in the crusader state of Edessa during its half century of existence, those same lords depended greatly on Armenian subordinates. Antioch, also captured in 1098 but of longer duration as a crusader state, was Byzantine Greek in population, culture, and institutions, having only been under Islamic domination for 14 years before the crusaders' arrival. Despite the influx of Normans and other French, Antioch

never lost its Byzantine flavor under the crusaders. The kingdom of Jerusalem, formed after the crusaders captured Jerusalem on July 15, 1099, had a mixed indigenous population of Muslims and Eastern Christians, and these natives played a major role in the kingdom's civil administration, especially as secretaries and scribes, because deeds and other legal documents were often written in Arabic. Tripoli, centered along the northern coast of modern Lebanon, was likewise richly diverse in population and traditions, which were reflected in the customs and institutions of the county.

As early as 1127, Fulcher of Chartres, former chaplain to King Baldwin I of Jerusalem, remarked on the new culture of the Frankish East:

Consider . . . how in our time God has transferred the West to the East. For we who were Occidentals have now been made Orientals. . . . We have already forgotten our birthplaces. . . . Someone who was a citizen of Rheims or Chartres now has been made a citizen of Tyre or Antioch. . . . Some have taken wives not merely from among their own people but from among Syrians, Armenians, or even Saracens who have received the grace of baptism. . . . Here also are grandchildren and great-grandchildren . . . [who] use the speech and ways of discourse of different languages.

These children, grandchildren, and great-grandchildren of crusaders, namely native-born Frankish inhabitants of the four crusader states of Syria-Palestine, were generally known as *Pou-lains*, an Old French slang word that originally meant "stylish young people with an attitude." Poulains were often of mixed heritage, having a parent or at least one grandparent who was an Eastern Christian or a converted Muslim. Although their education, religion, and general culture largely reflected that of Western Europe, they were not wholly European in tastes, attitudes, and speech. Their dress, diet, and day-to-day activities were often indistinguishable from that of their non-Latin neighbors, servants, and relatives, and the vast majority fluently spoke at least two languages, a West European tongue and a Levantine one. In addition to the suspicious

➤ IBN JUBAYR VISITS CRUSADER ACRE

In 1184 Abu al-Husayn Muhammad ibn Ahmad ibn Jubayr, a pilgrim from Valencia in Muslim Spain, spent 32 days in the crusader kingdom of Jerusalem as he traveled home from Mecca. Throughout his pilgrimage he kept an almost-daily journal of his experiences, and he had occasion to write extensively on Acre, the chief port of the kingdom, which he visited twice and from which he sailed to Sicily on his homeward journey.

"We were in Damascus—may God protect it—on the point of departure to Acre—may God restore it to us—to seek passage by sea with some Christian merchants. . . . We left Damascus . . . in a large caravan of merchants travelling with their merchandise to Acre. One of the strangest things in the world is that Muslim caravans go forth to Frankish lands, while Frankish captives enter Muslim lands. . . . Acre is the capital of the Frankish cities in Syria, the unloading place of ships . . . and a port of call for all ships. In its greatness it resembles Constantinople. It is the focus of ships and caravans, and the meeting place of Muslim and Christian merchants from all regions. Its roads and streets are choked by the press of men, so it is hard to put foot to ground. Unbelief and unpiety there burn fiercely, and pigs and

crosses abound. It stinks and is filthy, being full of refuse and excrement. The Franks ravished it from Muslim hands, . . . and the eyes of Islam were swollen with weeping for it. . . . Mosques became churches and minarets bell-towers, but God kept undefiled one part of the principal mosque, which remained in the hands of the Muslims as a small mosque where strangers could congregate to offer the obligatory prayers. . . . To the east of the town is the spring . . . from which God brought forth the cattle for Adam [Quran, 20:115]. . . . Over it is a mosque of which there remains in its former state only the mihrab [a wall niche indicating the direction of prayer], to the east of which the Franks have built their own mihrab, and Muslim and infidel assemble there, the one turning to his place of worship, the other to his. In the hands of the Christians its venerableness is maintained, and God has preserved in it a place of prayer for Muslims."

The Travels of Ibn Jubayr, trans. R. J. C. Broadhurst (London: Jonathan Cape, 1952), 313, 318–319.

practice of frequent bathing, which drew criticism from less culturally acclimated observers from the West, many Poulains were quite willing to tolerate the religious practices of their non-Latin and even non-Christian neighbors.

In addition to the native-born, there was also a constant influx of newcomers from the West, including crusaders who were there only for a short while in order to fulfill a crusade vow, merchants who took up residence for an indefinite period of time in one of the various port cities along the Levantine coast, and persons of every rank from nobles to peasants who, seeking a better life, intended to settle permanently in this region. Newcomers also included convicted criminals who chose passage to the crusader states over more serious punishments back home.

Whether they wanted to or not, all of these Franks, native-born and immigrant alike, were

forced to relate on a series of levels and in diverse ways with the Muslim and Eastern Christian majorities, whose combined numbers probably outnumbered the Franks by at least ten to one. Quite often this meant that they allowed their non-Frankish subjects a great deal of autonomy. Often the local Muslim *rais*, or patriarchal head of the council of elders, continued to oversee the running of the agricultural village where his family had ancient roots, and he collected taxes for the nonresident Frankish lord. Likewise, local *qadis* (Islamic judges) or councils of elders usually decided cases touching religion and custom that involved only Muslims.

Despite certain accommodations with indigenous Muslims and Eastern Christians and even with neighboring Muslim states, the crusader states were constantly on a war-footing. Frequent combat meant numerous wounds, which resulted in a significant development of reasonably

effective surgical and medical procedures. Such practical medicine stood in stark contrast to the study of theoretical texts that dominated medical education in Latin Europe's emerging universities.

Contrary to popular myth, the crusader states were not a conduit for the transfer to the West of Greco-Arabic philosophy and science. Despite a few exceptions, such as Archbishop William of Tyre, a native-born, twelfth-century historian who knew Arabic and was interested in the Islamic faith and its people, most of the colonial Latin clergy of the crusader states were not well educated and had little or no intellectual interchange with Eastern Christian, Muslim, and Jewish scholars. The schools associated with crusader churches were mediocre at best, and persons of promise who wanted a solid education went to universities in France and Italy. At age 16, William of Tyre left Jerusalem around 1146 to study the liberal arts, theology, and law in Orleans, Paris, and Bologna and returned in 1165.

Likewise, the crusader states were not the cause of Western Europe's economic revival, an economic upsurge that predated the First Crusade by decades and probably helped propel it. Once captured, however, the port cities of the crusader states, such as Acre and Tyre, were a major economic stimulus. They were magnets for Europe's maritime merchant powers, especially the Italian city-states of Genoa, Pisa, and Venice, which established self-governing quarters in them to serve their expanding commercial interests. From these port cities, commodities from farther east flowed into Western Europe in unprecedented quantities, thereby sharpening European tastes for Eastern goods.

One taste that Europeans discovered they had an almost insatiable appetite for was refined sugar, which they used as both a sweetener and

a medicine. Frankish colonists learned the process of refining sugarcane syrup from Arabs and set aside large tracts of land in the original crusader states for its production. Late in the thirteenth century, especially after 1291, the cultivation and manufacture of sugar moved to Cyprus, where it became the island's major industry during the fourteenth and fifteenth centuries. Processed on plantations by slave labor and transported west in Venetian ships, refined sugar fueled a demand that ultimately led in the sixteenth century to major environmental and demographic changes in the Americas as a consequence of the introduction of sugar production into Brazil and the Caribbean.

■ Introduction: Pre-Columbian Complex Societies—The Case of Amazonia

When dealing with the Americas after 1000 CE but prior to the arrival of Columbus, textbooks in world history always mention the Aztecs and the Incas, but generally leave it at that, giving the unwary reader the false impression that these were the only complex societies in the Americas after 1000 and prior to 1492. This notion is tantamount to the claim that the Americas constituted a vast hemisphere largely devoid of large settlements of people. Further, it dismisses the Americas as peripheral to world history prior to 1492.

A major reason behind this oversight and the wrong-headed conclusions that follow from it is the relative lack of documentary evidence relating to most of the many cultures that inhabited these lands. Most historians are fixated on written sources and are not trained in the use and interpretation of the artifactual evidence uncovered by archaeologists or of oral traditions passed down for generations and that extend back into a misty past. Happily, today's new breed of historians, especially those who turn their hands to world history, are becoming more comfortable with such data. A prime reason for this shift is the fact that so many of the new world historians were initially trained as specialists in areas such as sub-Saharan Africa and Central Asia, where use of non-documentary evidence is mandatory. They are even steadily making an older generation of world historians, who began their careers as specialists in the histories of such literate cultures as East Asia and Europe before they turned to world history, aware of the necessity to go beyond documents in order to uncover a fuller and richer past.

The entries under this topic only hint at the rich diversity of the complex cultures, or civilizations, that existed in the Americas between 1000 and 1500. Among the complex societies not accounted for in these essays and sidebars are some that rarely, if ever, are noticed by world historians: the large, well-organized communities of Amazonia. The reason for this failure to

deal with the pre-Columbian cultures of Amazonia is that so little about them has entered historical literature, confined as the topic is to largely technical archaeological, geographical, and ecological reports. It is time to begin to correct that flaw in the historical record.

The popular view of Amazonia is of a mysterious tropical rain forest in which the human hand has had little or no impact until recently, when bulldozers have cleared large swaths of "the forest primeval" in order to feed the world's insatiable appetite for cheap beef. Further, there is the shared assumption that it is an environment where it has been possible for only the most primitive native cultures to have subsisted, and such subsistence was in such harmony with nature that these marginal societies left no identifiable imprint on the environment. Certainly the idea that large complex societies, which managed, manipulated, and altered the environment, could have existed and even flourished in this hostile environment prior to the modern era is counter intuitive. But intuition is not a valid basis for either scientific or historical conclusions.

First, the vast region known as Amazonia consists of much more than jungle and a mighty river. In fact, Amazonia, which is roughly the size of the forty-eight contiguous states in the USA and covers about forty percent of South America, contains the world's largest rain forest, but that rain forest constitutes only about fifty percent of a richly diverse environment. Second, archaeological research in widely scattered regions of Amazonia has revealed the undeniable traces of societies that, for centuries, significantly altered the lands on which they lived. Third, evidence also suggests strongly that such alterations of the landscape and its flora were only possible through large-scale, well-organized communal efforts. Finally, the evidence also leads to the conclusion that many of these populations were quite large, at least before a massive population decline that occurred after the coming of the Spaniards and Portuguese and that was probably largely due to imported diseases.

The archaeologist Clark Erikson and his colleague, the anthropologist William Baleé, who have spent more than a decade and a half studying the Beni, a Bolivian province of some 30,000 square miles (77,700 square kilometers) dotted with islands of rain forest amid grasslands, have demonstrated beyond any reasonable doubt that, from at least 1000 CE until the arrival of Europeans, large, complex societies blossomed and matured in the Beni. In the savanna regions of the Beni, Erikson and others have found irrefutable evidence of large raised agricultural fields, fish farms, and more than 6,000 miles (9,655 kilometers) of constructed causeways. In both rain forest and amid grasslands, Erikson and his colleagues have also discovered the remnants of large numbers of cultivated groves of cacao trees, from which chocolate is derived, that long predated the conquest of South America by Europeans. What is more, the native farmers did not practice the highly destructive, semi-sedentary slash-and-burn, or swidden, method of agriculture. Rather, they carefully built up the soil on permanent raised farms that they laboriously constructed and cultivated. Slash-and-burn methods were introduced by the Europeans.

On the massive island of Marajó, located at the mouth of the Amazon River in Brazil, the archaeologist Anna Roosevelt discovered evidence of a complex society that persisted and did quite well there for more than a thousand years. Marajó, which is about 15,500 square miles (40,000 square kilometers), making it the world's largest fresh-water island, appears to have nourished a total population of roughly 100,000 inhabitants spread about the island in large communities that housed themselves on clusters of artificial platforms raised high above wet bottom lands. Their farms, on which they cultivated manioc (or cassava) and over a hundred other crops, stretched far and wide.

Other archeologists reported in 2006 the discovery of what has been termed an "Amazon Stonehenge," near Brazil's border with French Guyana. There they found 127 granite blocks, some as high as 9 feet (3 meters) tall, spaced at regular intervals around a hill and creating a crown-like entity that is 100 feet (30 meters) in diameter. At the winter solstice, the shadow of one of the blocks disappears when the sun is di-

rectly behind it, leading to the logical inference that this was an astronomical observatory. Dating the supposed observatory is not easy, and estimates based on nearby ceramic fragments (for these people did make clay pots) place its construction at anywhere from 2,000 to 500 years ago.

The North American cultures described by archaeologists in the entries under this topic, namely the Hohokam, the pueblo and cliff dwellers of the present-day Four Corners, and the mound builders of the Mississippian drainage, demonstrate beyond all doubt that America north of the Rio Grande River had indigenous civilizations well before the advent of the Spaniards. Likewise, the archaeological evidence emerging from Amazonia shows us that this vast region was not a jungle inhabited only by isolated bands of hunter-gatherers before 1500. Rather, it contained large, complex societies whose remains are only now coming to light and being understood for what they are.

Post-Classical Mayan States of the Yucatán and Guatemala

Following the Classic Maya collapse in the eighth century, a major readjustment occurred in the Mayan region, which mostly involved the abandonment of major cities and the founding of new polities elsewhere. While the causes for the end of the great Mayan civilization of the southern lowlands were multiple, including internal warfare, population pressure, and economic instability, many of the cultural features that had developed for over 1,000 years carried through in the Post-classical period, along with important ideological innovations.

During a transitional period defined by archaeologists as "Terminal Classic," a number of cities, probably created by a concentration of prior scattered settlements but also fueled by immigration, began to rise in the southern part of the Yucatán Peninsula. This region, known as Puuc, gave rise to a distinctive architectural style characterized by heavy superimposed decorations culminating in exaggerated roofs. Decoration tends to be rather abstract, planar, and geometric. While little is known of Puuc politics

and social organization, cities were well connected with one another, especially through the *sacbeob* (raised causeways), indicating communities' interdependence rather than isolation or conflict. A dominating center in this period was probably Uxmal, where the Classic Mayan tradition of divine rulership continued, celebrated with the erection of stelae (vertical stone slabs). At the same time, elements typical of central Mexican iconography bespeak a new trend that would become fully evident in the following centuries.

Chichén Itzá, one of the largest and best-known Mayan archaeological sites, rose to prominence in the ninth century and remained a hegemonic force in the Yucatán for the following four centuries. The core of the site is constituted by a series of large monumental structures adjacent to a large *cenote*, a natural well of water. In this dry region of Mexico there are no rivers, and cenotes are the main source of water. For the same reason, cenotes also acquired great religious significance. Chichén Itzá's cenote received the sacrifice of human beings along with hundreds of objects that were tossed in to please the gods, especially the rain god Chaac. Objects retrieved from the cenote come from places as far away as Panama to the south and the present-day American Southwest to the north, attesting not only to an extended commercial network but also to the paramount importance of Chichén Itzá as a pilgrimage center. The architecture of the site is also striking, combining Yucatec Puuc style in the southern part, including a round observatory, with central Mexican style and iconography in the monuments found in the northern part of the site. Here the Great Ball Court is the largest in Mesoamerica, measuring 380 by 223 feet (116 by 68 meters). The so-called El Castillo is a quadrangular pyramid with stairways on the four sides that prominently displays the powerful Feathered Serpent, whose cult was widespread in Mesoamerica in the Late Classical and Post-classical periods. The political and social organization of Chichén Itzá is poorly understood due to the scarcity of documentary or epigraphic (writing on stone) sources. Scholars tend to believe nonetheless that the city was ruled by a confederation of lineages (elite families), much in the same way that many Yucatec cities were at the time of the Spanish conquest.

➤ THE LEAGUE OF MAYAPÁN

The large city of Mayapán was governed through an institution known as *multe pal*, meaning "joint rule" in Yucatec Maya. Such administration is believed to be a major change from the more typical organization of the Classic Southern Lowland Maya, where rulership was confined in the hands of a single king who claimed power on the basis of claimed religious power. In the *multe pal* system, on the other hand, lineages prevailed over the single-person rulership. The coalition of different lineages allowed for the creation of a confederacy of states throughout the Yucatán Peninsula that lasted until the time of the Spanish conquest. It is thanks to sources written in the Mayan and Spanish languages through the course of the late sixteenth century that information on the basic outlook of the Post-classical states is known. In the *Books of the Chilam Balam*, for example, it is stated that an alliance of different families presided over large territories, defined as provinces, in the northern and western Yucatán. They formed the so-called League of Mayapán, whose ruling family was considered "first among equals." In the arts, this sharp contrast with the charismatic nature of Classic Mayan kingship is evidenced in the lack of portraiture in most Yucatec public monuments, where instead patron gods and the cardinal directions are emphasized.

—Alessia Frassani

The same urban, architectural, religious, and possibly political outlook of Chichén Itzá is replicated at the site of Mayapán, which usurped Chichén Itzá's position of hegemony in the middle of the thirteenth century. While historical sources point to a violent takeover, archaeological excavations are still lacking. This city grew to be larger than its predecessor, with an estimated population of 12,000 inhabitants. People lived in a densely settled area, in part due to the long walls (roughly 5.6 miles, 9 kilometers) that surrounded the main settlement. This city retained hegemonic status well into the fifteenth century, only a few decades before the arrival of the Spaniards.

In the Guatemalan Highlands, sociopolitical changes similar to the ones that occurred in the

Yucatán took place. Central Mexican influences, with explicit reference to the “Toltecs,” abound in sixteenth-century Mayan texts, our primary source on Post-classical Guatemala. All of the most important lineages claimed ancestry in the mythical city of Tula (the Toltec place of origin), such as the Quiché Maya, whose history is narrated in the *Popol Vuh*. The Quiché established their capital at Kumarcaah, also known as Utatlán, which in Maya means “Tula.” The city is a fortified citadel on a hilltop. Its planning reflected the complex web of lineages that constituted the city and gave it its strength. Lineage temples and community houses were situated around a plaza, at whose center was the temple of the Feathered Serpent, known as Kucumatz in Quiché Maya.

The People of Chichén Itzá

Chichén Itzá, one of the largest and most important of the Maya ruins, is located on the low, broad plain that forms the northern part of Mexico’s Yucatán Peninsula.

Chichén Itzá has been the source of considerable controversy over the years, largely involving the ethnic identity of the “Itza” and the two rather distinct architectural and art styles that exist at the site. Even the chronology of the site has long been in dispute. Traditionally, Chichén Itzá’s history has been divided into two major

phases. In the earlier phase (ca. 800–1000 CE) the site was purely Maya, and its buildings were in a regional style called Puuk (Puuc). Then, around 1000 CE, the site was taken over by a group whom some identified as the Toltecs from Tula. The Toltec foreigners (according to this traditional view of Chichén Itzá’s history) gained control of the site through conquest, and they controlled much of the northern part of the Yucatán Peninsula until shortly after 1200 CE, when they collapsed as a dominant society.

There are several problems with this reconstruction, which is still common in popular literature. For example, the dedication date (carved in Maya hieroglyphs) of the Great Ballcourt at Chichén Itzá is 18 November 864—impossibly early for a building argued to be one of the site’s quintessentially “Toltec” buildings. Additionally, “Maya” architecture and art at Chichén Itzá are not as clearly separated from and consistently overlain by “Toltec” architecture and art as was once thought. The current view is that there is considerable overlap between the two styles, although how much overlap is still a source of dispute, as is the absolute chronology of the site. It has been argued by some that Chichén Itzá may represent a kind of “cosmopolitan style” of art and architecture, borrowing freely from several areas for inspiration. Further, the art and architecture of Chichén Itzá seem to reflect a different order of government at this northern Yucatán site. There are none of the grandiose portraits of individual kings that are the hallmark of the kingdoms to the south. Rather, the hieroglyphs of Chichén Itzá describe a multiplicity of contemporary individuals, and the site’s art shows parades of lords: it appears that the site may have been ruled by some sort of council rather than a single succession of kings.

Who were the Itza, the people who are said to have ruled Chichén Itzá? Later descriptions call the Itza foreigners and tricksters and portray them as “lewd” and unable to speak fluently. This depiction clearly indicates that they were foreigners—but whether they were Toltecs from Tula or some other group remains a subject of debate. Much evidence points to the southern Gulf of Mexico region where Mexicanized Maya groups lived and honed their skills as some of Mesoamerica’s greatest long-distance traders.

More recently, evidence has arisen to indicate that the Itza might have been refugees from the internecine warfare of the southern Maya lowlands in the late-classic period. The name *Itza*, in fact, shows up in classic-period texts from Motul de San José, a site not far from Tikal, so we know that some Itza lived and ruled there. Maya chronicles describe a long series of migrations from the Itza homeland until these people founded and settled in Chichén Itzá.

Dominating the site of Chichén Itzá are the buildings arranged on a huge platform that is 1,475 by 1,970 feet (450 by 600 meters) in area. Near the center of this platform is the so-called Castillo, or Castle, the tallest temple-pyramid at the site. On the western edge of the platform is the largest ballcourt in Mesoamerica. The Great Ballcourt is richly decorated with imagery symbolizing the Mesoamerican mythology of creation and the sacred charter of government, as well as murals that document the wars of conquest that gave the victors the right to rule.

Chichén Itzá is also famous for its Sacred Well, which was used as a place of ritual offerings by the Maya even after the site was abandoned. The well has been dredged several times, and thousands of archaeological pieces have been recovered. These include huge numbers of carved jade artifacts; wooden objects such as scepters, weapons, and idols; ceramics; balls of resin incense; human bones; and bells, disks, and figurines of gold. Chichén Itzá in general and the Sacred Well in particular were used as places of pilgrimage well into the Spanish colonial period, much to the consternation of the Spanish priests and administrators.

According to legend, the city fell through sorcery and trickery, but almost certainly its demise was due to fighting among rival lineages. Maya chronicles from the Spanish colonial period say that in 1221 CE, the ruler of Chichén Itzá was defeated by the ruler of the nearby, emergent city of Mayapan and that the Itza were driven from their capital. Today Chichén Itzá is one of the most frequently visited archaeological sites in Mexico. It is a dramatic location, with broad vistas punctuated by some of the most grandiose pyramids and decorated temples in the entire Maya area.

—Peter Mathews

➤ THE CENOTES OF CHICHÉN ITZÁ

The Yucatán Peninsula is composed of limestone (it is an ancient, shallow seafloor), and there is little surface water in the region: the rain soaks through the thin soil and forms caves below the surface. If the roofs of these caves collapse, sinkholes (*cenotes* in Spanish, from the Maya *tz'onot*) are formed. Chichén Itzá has several of these sinkholes within the confines of the site. The term *Chichén Itzá*, which means “the mouth of the well of Itza,” is derived from the name of the largest of these sinkholes—the so-called Sacred Well.

The Toltecs

Toltecs is the name given to a group of people who were considered by the Mexica (or Aztecs) and most of their contemporaries to have represented the golden age in Mesoamerican history. Toltec means “people of the place of reeds,” and Tollan (Tula), the name of their capital city, which means “the place of reeds,” figures in the origin myths of many Mesoamerican peoples from the Maya to the Mexica. Descriptions of Tollan as a mountain surrounded by reedy swampland may well have been an evocation of the environment of Mesoamerica’s first civilization, the Olmecs, and their human-made mountains in the swampy lowlands on the southern borders of the Gulf of Mexico.

Because of the widespread origin myths involving Tollan, there are actually many places in

THE TOLTEC LEGACY

Despite the devastation of the city, the Toltecs left an important legacy. Tollan was the metaphor in Mesoamerica for civilized life, and the Toltecs were eulogized as master artisans and artists. Later peoples went to great lengths to claim Toltec heritage. For example, the ruling families of the cities in the basin of Mexico all claimed descent from Toltec royal lines, and those groups that didn't have Toltec blood sought to marry into lineages that did: having royal Toltec ancestry was a major prerequisite of legitimacy. The Mexica were one such group, and their leaders went to great pains to obtain Toltec ancestry through marriage. Once they had achieved that end, the Aztecs reinforced their "Toltec heritage" by looting the site of Tula and incorporating its sculptures and other relics into their own imperial capital's buildings and ritual offerings.

—Peter Mathews

Mexico that have used or incorporated the name (which was corrupted by the Spaniards to Tula). Archaeologically, the Toltecs have been identified specifically with the site of Tula, about 43 miles (some 70 kilometers) north of Mexico City. This site was first occupied during the eighth century CE, as the ancient city of Teotihuacán, which had dominated Mexico during the first millennium CE, was declining. By 900 CE, Tula was a major site, and in the following 300 years, it came to dominate central Mexico.

At its height during the eleventh and early twelfth centuries, Tula covered about 8 square miles (13 square kilometers) and had a population of up to 60,000 people. The central part of the site had broad plazas punctuated with temple pyramids, ball courts, and colonnaded palaces. Toltecs who were farther down on the social scale lived in flat-roofed houses with sleeping rooms arranged around open patios where many of the daily activities would be undertaken. Family altars and shrines have been found in the patios of several houses, and the houses themselves were connected by passageways and alleys. There is evidence that much of the city was laid out in a rough grid. Workshops abounded in Tula, especially for work in obsidian and ce-

ramics. Agriculture was carried out with the aid of irrigation because rainfall is low and unpredictable in the area, and the dozens of small farming hamlets that have been found within about 9 miles (15 kilometers) of the city must have provided much of Tula's food supply. In the Mesoamerican tradition, additional food and other commodities would have flowed into the city as tribute from subject regions.

By the late twelfth century, Tula was in trouble. The central ceremonial part of the site was sacked and burned, and there are signs of destruction in the suburbs as well, for some courtyards and altars were looted. Later historical accounts mention a civil war in the city, but the final collapse of Tula may well have been at the hands of invaders from the north, the "Chichimeca" peoples.

The Mexica and Their Neighbors

On the eve of the arrival of the Spaniards, central Mexico was a land rich in diverse cultures, languages, and polities, a fact often overlooked by many modern historians who tend to concentrate on the Mexica, or Aztecs. When the Mexica arrived in the Valley of Mexico in the late 13th century, it was already fairly densely inhabited. The valley was called Anahuac, meaning "near the water." The most important political unit of Mesoamerica was the city-state (*altepetl*). The *altepetl* normally consisted of two to four internal neighborhoods (*calpolli*) and other nearby towns and villages that provided tribute and labor for the benefit of the *altepetl*. The Mexica had founded two cities on the mudflats in Anahuac. The principal city was Tenochtitlan. But a secondary city, Tlatelolco, had also grown up on a nearby islet

to the north. Tlatelolco would become the mercantile capital of the Mexica and gain fame for the richness and diversity of its market.

At least four powerful city-states dominated parts of the valley: Texcoco, Chalco-Amaquemecan, Culhuacan, and Atzacapotzalco. Two of these—the Acolhua of Texcoco and the Culhua of Culhuacan—claimed descent from the Toltecs. As heirs of the Toltecs, these two city-states exemplified the highest levels of culture, dedication to the arts, and good government. Texcoco controlled the northeastern part of the valley. The far northeast was semiarid, while the eastern region was better watered and possessed many natural springs. In general, all of the major city-states controlled some of the rich agricultural lands along the edge of the lake. Culhuacan occupied the southwestern region of the valley. It was well timbered but also home to a rugged nomad's land of volcanic rock, later known as the Pedregal. Chalco-Amaquemecan was blessed with plentiful fresh water and some of the most extensive agricultural areas and was located at the

intersection of routes leaving Anahuac toward the south and east. Atzacapotzalco, home to the Tepanec, occupied the northwestern region of the valley. Like Texcoco, the northern reaches were semiarid and rocky, but the central region was home to the famous springs of Chapultepec. In general, the southern reaches of the valley had more fresh water. In the northern regions, what lake water there was tended to be saltier since there was no natural outflow for the valley's water. The water flowed generally from south to north in increasing degrees of salinity. The second major city of the Tepanec region was Tlacopan, a junior city to Atzacapotzalco. While the ruler of Atzacapotzalco had originally been a protector for the Mexica, they overthrew his lordship and established the triple alliance with Tlacopan and Texcoco.

The Tepanec also had a significant area of influence outside of Anahuac toward the west, principally in the Toluca Valley. Beyond them to the west and north was the powerful Purepecha kingdom of the Tarascans. The Purepecha were

► THE AZTECS, THE MEXICA, AND THE NAHUA

The people we popularly call the Aztecs called themselves the Mexica. The term “Aztec,” which means “the people from Aztlan,” was not used to any great degree before the nineteenth century. The migration legends of the Mexica state that they originated in Aztlan and traveled over the course of several generations to what is now the Valley of Mexico. Like the other peoples of the valley, they spoke the Nahuatl language. Consequently, all of those people could correctly be called Nahua, along with many people in the surrounding valleys of Toluca, Tlahaica, and Tlaxcallan-Huehotzinco-Cholollan. In the fourteenth century the Mexica of Tenochtitlan, under the leadership of Motecuhzoma Ilhuicamina, became independent from Atzacapotzalco and allied themselves with two other city-states, Texcoco and Tlacopan. Tlacopan was a junior member of the Tepanec empire that gained dominance with the fall of Atzacapotzalco. Many people term that triple alliance “the Aztec alliance.” Consequently, the term “Aztec” can be used for the alliance of the three city-states or to refer specifically to the migratory people who left Aztlan.

—John F. Swaller

ethnically and linguistically distinct from the Nahuatl-speaking peoples of Anahuac and its environs. Their empire was based in the lakes region known to the Nahua as Michoacán (“place of the fishermen”). Although the Mexica had attempted major invasions of the Purepecha region, they had failed. An uneasy peace developed in the Toluca Valley between the Nahuatl-speaking peoples associated with the Mexica and the Purepecha speakers of the Tarascans.

Beyond Anahuac to the north were the lands of the nomadic hunters and gatherers known generically as the Chichimeca (“people from the place of sucking”). These were ethnically diverse groups including both Nahuatl speakers and speakers of Otomí, a distinct indigenous language. Because this region was mountainous and drier than Anahuac, there had been few efforts on the part of the Mexica to conquer it.

The kingdom of the Tlahaica formed the region to the south of Anahuac. The Tlahaica were

also Nahuatl speakers and were culturally similar to the Mexica. The main city was Cuauhnhuac (Cuernavaca). The region fell to the Mexica during the reign of Itzcoatl. Because this area was significantly lower in altitude than Anahuac, tropical fruits and other hot-land crops could be successfully grown there. Moreover, its many thermal springs and pleasant weather made it a favorite vacation destination for the Mexica elite.

To the east of Anahuac there were three major city-states: Tlaxcallan, Huejotzinco, and Cholollan (Cholula). All three of these were Nahuatl-speaking areas that generally shared the same culture as Anahuac. Cholollan claimed a Toltec heritage, with many of its leading families tracing their lineage to the Toltec diaspora. Huejotzinco was a newer city, perhaps also founded at the time of the fall of Tula (ca. 1200 CE), but it thrived due to its productive agriculture and location along a major long-distance trade route. Tlaxcallan was a distinctive political entity. Unlike the other states in which there was one dominant city, Tlaxcallan consisted of four powerful cities allied in a single political unit. Its territory contained both cold mountain highlands and hot valley lowlands, allowing it a diversity of agriculture and gathering from many varied climatic zones. While both Cholollan and Huejotzinco had at one time or another been defeated by the Mexica, Tlaxcallan had remained independent.

The Aztec/Mexica Empire

Aztec is the name popularly used today to label the people who dominated central Mexico around

1500 CE. Actually, “the Aztecs” never used the term to describe themselves; rather, they were Nahuatl-speaking peoples divided into about twenty different ethnic groups. The most famous of these groups, and the preeminent one when the Spaniards arrived in Mexico, were the Mexica.

The Mexica arrived in the basin of Mexico (where Mexico City stands today) probably some time during the thirteenth century CE. According to their own legends, they arrived along the western shores of Lake Texcoco as an impoverished, uncouth group into a region that was already fairly fully occupied by a series of kingdoms. Despised as barbarians by the existing inhabitants, their only skill was an aptitude for warfare under the strong influence of their patron god of war, Huitzilopochtli.

Gradually, the Mexica grew stronger. They settled their capital, Tenochtitlan, sometime around 1325, and toward the end of the fourteenth century began to make a concerted drive to achieve a position of strength in the region. In 1428, they and several allies overthrew the Tepanecs of Azcapotzalco, the most powerful kingdom in the basin of Mexico at the time. In one sudden move, the Mexica had become the most powerful group in ancient Mexico. With their main allies, the Texcoco and the Tlacopan, the Mexica formed a so-called triple alliance that proceeded to expand its territory aggressively throughout central Mexico; they were still doing so when the Spaniards arrived in 1519.

The Mexica controlled what has often been called “the Aztec empire.” In fact, the empire was a collection of subjugated groups and kingdoms held together by a combination of force and intimidation. A major aspect of this subjugation was tribute. If a town or region submitted voluntarily to Mexica might, the amount of tribute that it would have to pay annually might be quite light; regions captured in war or rebellious towns would be assessed a far more onerous amount. There are detailed surviving accounts of the tribute that poured into Tenochtitlan each year: the tribute was one of the things the Spaniards were most interested in as they wished to continue the process for their benefit.

The Mexica are perhaps best known for the warfare they waged and for their practice of hu-

➤ LORD ACAMAPICHTLI

The semi-legendary Lord Acamapichtli was the first Chief Speaker of the Mexica (r. ca. 1369–1403), whose reign marked the beginning of the Mexica’s drive to become an independent political entity. By paternal blood and marriage, he also linked the Mexica royal line with the Toltecs and their patron deity Quetzalcoatl, an ancestry that now gave the Mexica a civilizing legitimacy. He was also perceived as acting as the “likeness” of the Mexica patron deity Huitzilopochtli, who was closely associated with the great god Tezcatlipoca. This first ruler therefore embodied two of the most powerful deities in the Nahuatl cosmos, Quetzalcoatl and Tezcatlipoca, and thus served as a harbinger of the Mexica’s later dominance over central Mexico.

man sacrifice (something they had in common with all the other peoples of ancient Mexico). But they were also great engineers, architects, artists, and poets. The Spaniards could barely believe the beauty of Tenochtitlan when they entered it and were astounded by the great artistry of the Mexica in paint, wood, ceramic, stone, and silver and gold (almost all of which the Spaniards melted down into ingots).

“Who could defeat Tenochtitlan, who could shake the foundation of heaven?” asked one Mexica poem. In fact, the Mexica were conquered by the Spaniards and a host of native allies, chief of whom were the Tlaxcaltecs. Although the majority of the people of Tlaxcalteca (or Tlaxcala) were, like the Mexica, speakers of Nahuatl, they were bitter enemies of the Aztec empire and had managed to retain a precarious independence, despite being surrounded by Mexica-dominated lands. After a siege of several months, Cortés’ troops and his tens of thousands of indigenous allies entered Tenochtitlan on August 13,

1521, signaling the end of the Mexica empire. For their key role in overthrowing the Aztec empire, the Tlaxcaltecs were rewarded with honors, tax exemptions, and limited self-rule by the Spanish colonial government.

The Chimú State

The Chimú dynasty, about which we know very little, ruled a large kingdom that stretched for several hundred miles along the Andean desert coast in present-day Peru from around the early fourteenth century until the late fifteenth century. A series of ten Chimú kings ruled the kingdom of Chimor, which produced the magnificent capital city of Chan Chan (located near present-day Trujillo). The city's foundations go back to around 850 CE, and it grew progressively over the centuries, reaching its peak under the Chimú. The high level of organization established by the Chimú state and the wealth it amassed, undoubtedly

attracted the Incas, who annexed the kingdom into their growing empire around 1470.

According to later Spanish accounts, early in the fourteenth century the Chimú dynasty, which originated in the Moche Valley, began to dominate and consolidate a number of smaller kingdoms into an empire. The Chimú king, who ruled from Chan Chan, was considered divine and consequently was responsible for the well-being of his people through his connections to the gods.

The Chimú were dependent on large-scale agriculture to support their growing population, and they built many canals and improved on others left by earlier peoples to bring water from several rivers to the dry areas of their empire. Chimú society was divided into strict class levels, with a few nobles at the top and the mass of peasants and artisans at the bottom. Chimú culture is not known for its innovation, but it is famous for the highly developed skills of its artisans, especially in crafts involving textiles, wood, shells, and metals.

Despite an extensive defensive line of fortifications, the Inca empire easily defeated the last Chimú king, Minchançaman, at the Battle of Chan Chan and incorporated his kingdom around 1470. The Incas absorbed many parts of the Chimú culture, including its political organization, irrigation systems, and roads. Many Chan Chan metal craftsmen were deported to work for the Incan ruler, but in typical Incan fashion a large number of Chimú lords continued to administer their local areas.

—Alfred J. Andrea

▶ CHAN CHAN'S WORKING CLASSES

Most artisans lived in one of the many Chimú cities and towns, including Chan Chan. Much of what is known about the Chimú was learned from the remains of their large capital, which covered at least 12 square miles (31 square kilometers) and was home to between 50,000 and 100,000 residents at its peak. Excavation at the site, which was already heavily looted, only began in 1969.

Ten massive *ciudadelas* (citadels or little cities) dominated the city, each of which was surrounded by thousands of small irregular rooms that served as the living and working quarters for the city's laborers and artisans, who constituted the majority of the city's population.

The Incan Empire

In approximately 1200 CE, a small tribe called the Incas migrated north from the Lake Titicaca Basin into the Cuzco Valley in modern Peru. Over the next three centuries, the Incas built what would become the most powerful and far-reaching pre-Hispanic empire in Andean experience. Between 1450 and 1532, the Incas conquered and then governed diverse peoples and cultures stretching from modern Ecuador and Colombia to central Chile. Many observers have compared this Incan achievement with ancient Rome. Indeed, although these represented two very different civilizations, they shared several features and traits.

While the Incas incorporated and then expanded upon many pre-Incaic traditions and technologies, they are perhaps best known for constructing a sophisticated network of imperial roads and for their suspension bridges and stone-masonry techniques. This communications and transportation grid connected all four administrative divisions of the empire to Cuzco, the Incas' capital. Incan engineers constructed pathways through vast stretches of desert, sandy beaches, and treacherous highland passes. Although many of these roads and bridges have disappeared over time, archaeologist Nigel Davies estimates that this network, at its zenith, included over 25,000 miles (40,000 kilometers) of roads and bridges. Perhaps the most important road linked Cuzco to Quito. It averaged 10–50 feet (3–16 meters) in width.

The Incas employed a system of relay runners called *chasqui* to deliver important messages via this communications system. This included couriers carrying *quipus* and other small goods. It functioned as a fast-paced highly efficient system. In Cuzco, for example, the emperor's meals usually included a selection of fresh fish from Chilean waters.

This communications system represented a unique achievement in world history. The Incas lacked alphabetic writing, but they did not lack records. We do not know for certain whether the Incas recorded historical information, however. They inherited and incorporated an earlier Andean information storage and retrieval system known as the quipu. Quipus were complex multi-dimensional and multicolored arrays of up to several dozen cotton or woolen cords, subsidiary cords, and top cords spun and then knotted in at least three different ways each and in quite diverse combinations.

Until recently, scholars believed that the professional, administrative *quipocamayo* class kept strictly operational, or census and accounting, data mainly concerning tribute and taxes. But in 1985 ethnohistorian John Howland Rowe discovered a colonial-era document that suggests that a quipocamayo read historical data from a quipu into court records. And since then, ethnohistorians, such as Gary Urton, have proposed that Incaic quipus served a far more complex purpose than the previously agreed upon mnemonic one, comparable to, say, a simple message stick. This uncertainty notwithstanding, scholars do know that chasqui runners often couriered quipus to Cuzco over great distances, thus staffing and operating the above-described communications system.

These and other administrative tools and techniques enabled Cuzco to field, direct, and support large armies and run ambitious military operations. These organizational advantages ensured the Incas' strategic and decisive superiority in the Andes. Only the Spaniards, possessing Eurasian-derived biogeographic and military advantages, including smallpox, oceangoing ships, horses, and steel weapons, defeated and conquered them.

In addition to the Incas' adaptations and innovations in communications, transportation, and administration, they remain renowned for their unparalleled, indeed uncanny, expertise in fine stone masonry. Relying on relatively primitive technology and tools and only human labor, Incan engineers and architects selected large stone blocks at faraway quarries. They then moved these stones over long vertical distances without the benefit of draft animals or the wheel.

➤ INCAN RULERS

We know almost nothing about the earliest Incan rulers. According to Incan myth, Manco Capac, the first known Inca king, conquered and settled the Cuzco Valley circa 1200. His three brothers turned into sacred stones, or *huacas*. Seven kings succeeded Manco Capac. They supposedly ruled until 1438.

Two moieties, or upper and lower halves, divided Cuzco and many other Andean kingdoms as well, some of them pre-Incaic. Several hypotheses exist to account for this. One suggests that two kings, and not one, ruled the Incas during these early years. While this would not be unique in world history, as both the Spartans and the Romans elected two kings and two consuls, respectively, the data are inconclusive with respect to the early Incas.

Pachacuti, the ninth and perhaps greatest Inca ruler, began an ambitious expansionistic empire-building program, probably in the mid-fifteenth century, although this, like much else in pre-Hispanic Andean history, remains tentative and uncertain. He also renovated Cuzco and appears to have consciously revised Inca history so that it would represent and justify the new Incan order. Pachacuti created *panacas*, or royal houses, consisting of former rulers' descendants. The *panacas* served as depositories of official history, which included not only quipus but paintings and oral traditions as well. These royal houses also cared for the former king's mummified remains, which the people of Cuzco worshipped as divine. Early colonial Spanish writers such as Pedro de

Manco Capac, seventeenth-century depiction. (David Marley)

Cieza de León drew on this information in the chronicles they produced.

—James Douglas Lockhart

When the stones arrived at the construction site, these engineers and workers shaped the stones into sometimes polygonal, sometimes perfectly rectangular shapes and then precisely fitted them together without mortar, forming immense walls, canals, and other structures. Today, five centuries after the Conquest, one cannot insert so much as a knife between any two of these shaped stones at any juncture. Some of the most notable examples of this craft remain visible at Machu Picchu and Sacsahuaman, a military fortress outside Cuzco. One famous stone, called Hatun Rumiyok, features 12 corners.

Apart from these technologies, the Incas' genius lay in their incorporating, mastering, and then refining preexisting grassroots Andean socioeconomic patterns to suit their needs. Peru's Indian peoples had long relied on what ethnohistorian John V. Murra described as a vertically oriented archipelago economy. Villages and kin groups called *ayllus*, which primarily inhabited one specialized ecological zone, such as the highlands, would colonize or trade with others, which primarily inhabited other specialized ecological zones, such as the coast or the rainforest lowlands. These polities created obligations and

paid debts through an elaborate reciprocal gift-giving and community service system.

The Incas' central government respected and built on this older pattern. The Incas not only relied on it when constructing roads and bridges or staffing their armies. They also used it to expand on terraced agricultural fields and the canals that serviced them and to stock strategic state storehouses with foodstuffs and wool, among other vital goods and necessities.

Through imperialism, military conquest, and good government, the Incas accumulated vast sums of gold, silver, and other wealth. Incan elites stored much of this jewelry in shrines. They also wore some of it. After the conquistador Francisco Pizarro seized Atahualpa at Cajamarca in 1532, the emperor offered to pay an enormous ransom to secure his freedom. Atahualpa promised to fill a room measuring some 22 by 17 feet (6.7 by 5 meters), up to a height of approximately 8 feet (2.5 meters), with gold objects. The Incan ruler also pledged to give twice that amount in silver. He promptly delivered on his promise. But Pizarro, fearing intrigue, still garroted him.

The conquistadores later raided every Incan shrine they could find for gold. At sites such as Coricancha, Spanish cavalymen discovered gold statues in the image of former rulers as well as in one fantastic find, a garden adorned with imposing water fountains and many stylized birds, all cast in gold and silver. The Spaniards seized and bickered over most of this treasure. The Spanish king received one-fifth of this. He melted it and then used it to finance his wars in Western Europe and the Mediterranean.

The Incas were also rich in other respects. After executing Atahualpa, Pizarro elevated Manco Inca in his place. Manco organized a *chaco*, or a great royal hunt, just outside Cuzco. He invited Pizarro and several other conquistadores to observe and participate. They reported witnessing approximately 10,000 Indians encircle and then, making a good amount of noise, drive inward tens of thousands of animals, where hunters killed or captured for their meat or wool as many as Manco asked for.

Such displays of the Incas' mastery over their environment ceased to occur by the late sixteenth century, as the Spanish Crown consoli-

dated its gains and position in Latin America and the Caribbean. Spanish rule indeed assaulted and destroyed Incan government and society on multiple fronts. And today little remains of this once undeniably prodigious civilization.

Mississippian Peoples of North America

Mystery pervades the origins of what archaeologists call the Mississippian Culture, which emerged around 700 CE along the banks of the lower Ohio, Illinois, Tennessee, and Middle Mississippi rivers. Archaeological research from the excavation of burial mounds throughout the United States suggests that this society/culture reflected a movement toward more elaborate burial practices and hence a much more stratified social structure. Moreover, many scholars postulate that Mississippian Culture was an outgrowth of Hopewell Culture. While the early members of this culture were hunters and gatherers, they moved gradually to the cultivation of native crops and then between 450 and 800 CE to the extensive farming of maize and beans. It seems plausible, according to many archaeologists, that this shift resulted from overpopulation and/or demands of elites.

Accompanying the extensive maize and bean cultivation, Mississippian Culture saw a major transformation between 800 and 1000 to more elaborate settlements as reflected in new pottery forms (decorated often with engravings or paintings), sophisticated platform mounds, and large rectangular houses. The masses of these villages lived around a rectangular or pyramidal flat-topped mound, which had wooden temples

or houses of the leading men constructed on its summit. Some of these settlements possessed palisades, which many archaeologists attribute to the movement to bigger (more complex) villages and hence to the emergence of a more hierarchical society. In addition to their cultivation of maize, squash, and beans, Mississippian communities harvested nuts, fruits, berries, and seed-bearing plants. Moreover, many of these natives were adept hunters whose skill allowed their families to feast on deer, raccoon, and waterfowl. It is estimated by some scholars that more than 50 percent of the Mississippian villagers' diet came from fish and waterfowl. This sophisticated multisource food chain suggests a changing and more hierarchical society with an increasing concentration of power in the hands of a few men and clans.

The largest Mississippian town so far located and excavated is Cahokia, Illinois, a World Heritage Site found on the east bank of the Mississippi River almost directly opposite present-day St. Louis, Missouri. From archaeological excavations, it is inferred that Cahokia once boasted more than 100 earthen mounds and supported a population of perhaps 30,000–35,000. As the in-

habitants possessed no earth-moving equipment or any wheeled conveyances or beasts of burden, it seems likely that construction of the town required tens of thousands of laborers carrying earth in baskets over a period of a few hundred years.

The largest mound at Cahokia—today known as Monk's Mound because of a Catholic monastic community that apparently once farmed its terraced slopes—covers nearly 16 acres (6.5 hectares), rises to a height of ten stories in two terraced levels, and was built in four discrete stages between the ninth and eleventh centuries. Standing at the center of the community, it had a thatched temple on its summit. Around this central core/plaza were constructed other mounds, temples, administrative buildings, and the houses of noblemen.

Cahokia's center, or downtown, encompassed an area of more than 200 acres (80 hectares) and included a palisade fence surrounding its perimeter along with watchtowers. Lesser mounds and structures of suburban-type communities were located outside of Cahokia's fenced interior, each with its own plazas and burial mounds. The residential core of the town, with its pole

and thatch houses, encompassed in its heyday an area of more than 2,000 acres (800 hectares). The dimensions and scope of Cahokia suggest the extent of planning employed and the level of central authority required to construct and manage such a vast community.

Cahokia, while the most extensive of the Mississippian urban centers, was not unique. Great temple-centers were erected in Spiro, Oklahoma; Moundville, Alabama; and Etowah, Georgia. Archaeologists surmise from their excavation of Mississippian burial mounds that most of their settlements were dominated by central chiefs along with a priestly class and noblemen. As with the Hopewell Culture, the most important people within these Mississippian communities were buried in richly decorated graves indicating their social status. In addition to indicating the status of various individuals, the funerary artifacts discovered within the burial mounds also reveal a common set of ritual beliefs. In many burial mounds of the Southern Cult, or Southeastern Ceremonial Complex, which flourished from around 1000 to about 1600 throughout the American Southeast all the way to Texas and Oklahoma and north to the lower Ohio and Mississippi rivers, the art therein exhibits a consistent presence of bird symbolism and weeping-eye (or hawkeye) symbols that presumably had religious significance. Yet some scholars such as Jon Muller postulate the differences found in Mississippian art motifs emanated from centuries of artistic exchanges among the hundreds of existing Mississippian communities.

Most of the important ceremonial centers were past their prime by 1500, but although Cahokia had already been abandoned, many lesser settlements persisted within the mid-South and Southeast until the arrival of Europeans. While many Southeast natives succumbed to the spread of European diseases (that spread along native trade routes even before direct contact with Europeans), a number of communities prospered, as evidenced by the 1540–1542 Spanish description of (for lack of a better term) the kingdom of Coosa, which encompassed a number of towns and chiefdoms stretching from present-day eastern Tennessee to Alabama and Georgia, and the 1720 French description of the Natchez people of the Lower Mississippi Valley, who built flat-

➤ WHERE DID THE MISSISSIPPIANS GO?

Mississippian Culture had reached its peak by the time of the arrival of Europeans in the sixteenth century. Initially, the old ceremonial centers were abandoned for reasons that are not clear, and then these peoples dispersed to increasingly smaller settlements. Great population declines occurred, especially in the Caddoan area and lower Mississippi Valley, as a result of diseases transmitted from the Europeans. Although the French encountered remnants of the Mississippian Culture (such as the Natchez people), the mound-building cultures grew less and less distinct. Yet other groups persisted, such as the Chickasaws, Choctaws, and Cherokees, that were in the final stages of mound building when the Europeans arrived in the Southeast.

—John S. Leiby

topped ceremonial mounds. According to this latter account, the Natchez were led by an absolute ruler called the Great Sun, so-named because they believed that he was descended from the Sun Woman goddess. For that reason, power passed matrilineally (to the son of the former chief's sister). The Natchez people consequently had a highly stratified society, with the Great Sun and his relatives at the pinnacle of power. The Natchez, the last of the significant Mississippian Mound Builder cultures, were effectively destroyed as an identifiable people in their wars with the French during the 1720s, leaving behind their name, which lives on in a city in Mississippi and in an ancient trade route (the Natchez Trace), and their genes in the Muscogee (Creek), Chickasaw, and Cherokee tribes.

The Hohokam—A Civilization of the Sonoran Desert

Archaeologists continue to debate the precise origins of the Hohokam culture that evolved primarily along the banks of the Gila and Salt rivers of southern Arizona. Emil W. Haury, who began his studies of the Hohokam in the 1930s, postulated that perhaps they had migrated from Mexico, yet this theory has largely been discarded. What is generally accepted is that they were among the peoples who made their way to what today is the American Southwest sometime after 7000 BCE as hunter-gatherers. The Hohokam eventually located themselves in southern Arizona and northern Mexico, although they established some communities northward in the direction of present-day Flagstaff.

This culture constructed elaborate irrigation canals, ball courts, and platform mounds, which enable archaeologists to classify the principal characteristics and historical stages of their civi-

lization. Haury delineated Hohokam evolution into four stages: Pioneer (1–900 CE), Colonial (600–900), Sedentary (900–1000), and Classic (1100–1400). As evidenced by their distinctive red-on-buff pottery, they inhabited, in the various stages of their evolution, some 27,000 square miles (70,000 square kilometers) of land.

Through their knowledge of the desert terrain and use of effective irrigation canals (most constructed with few tools), they built a series of impressive communities primarily in the Gila River valley around present-day Phoenix that housed between 5,000 and 10,000 people during the Classic period. As a consequence of their adept knowledge of their environment, the Hohokam were superb farmers who grew a wide variety of crops such as maize (corn), jackbeans, tepary beans, lima beans, squash, barley, amaranth, gourds, cotton, and tobacco. In addition, they harvested wild desert plants, especially agave and cholla cactus. Many archaeologists surmise from excavations of bone fragments that the Hohokam were effective hunters who supplemented their vegetarian diet with various rodents, birds, jackrabbits, cottontail rabbits, mule deer, pronghorn antelope, and bighorn sheep. Additionally, the Salt and Gila rivers as well as their canals provided fish.

In the 1930s archaeologists began to excavate what today is the best-known and most elaborate and extensive Hohokam settlement, Snaketown, located at the juncture of the Gila and Salt rivers in the Phoenix Basin. In its prime it had a populace of perhaps 500–1,000 around 900 CE living in more than 125 pithouses and boasted the presence of two ball courts (each nearly 60 feet [18 meters] long and 40 feet [12 meters] wide), which most archaeologists regard as the most elaborate yet excavated in the American Southwest. Snaketown's sophisticated configuration, like that of other significant Hohokam communities, indicates a complex social structure.

Casa Grande (Big House), a single four-story structure located near the present-day town in southern Arizona with the same name, was another Hohokam construction. It was constructed in the early 1200s and then abandoned by the mid-1400s according to tree-ring and carbon testing. Such structures were characteristic of the

Casa Grande (Big House) was a Hohokam structure built in the early 1200s and then abandoned by the mid-1400s. Such structures were characteristic of the multi-storied adobe complexes that the Hohokam built during their Classic Period, but Casa Grande is the largest and only intact “big house” dating from that era. Some scholars have surmised that it served as an astrological observatory. (James Jones)

multistoried adobe complexes that the Hohokam built during their Classic period, but Casa Grande is the largest and only intact big house dating from that era. Some scholars have surmised that it served as an astrological observatory.

Pueblo Grande (Big Town), in present-day downtown Phoenix, which saw some settlement prior to 500 CE, is another example of the evolution of Hohokam culture. Within a short span of a few centuries, it expanded to encompass a town more than a mile in diameter.

In addition to their magnificent ball courts (more than 30 from more than 20 villages have

been located and identified) the Hohokam built platform mounds that were the cornerstones of major villages (more than 50 have been identified). These mounds appear to have been modest in size during the 800s but by the 1200s had emerged into large rectangular mounds. Some archaeologists have suggested that the Hohokam elite resided on top of them, whereas others have argued that they were used for important ceremonies or rituals linked to agriculture. Whatever the truth, it is clear from the extent of the platform mounds, ball courts, and canals that the Hohokam had a hierarchical society. It also

➤ WHERE DID THE HOHOKAM GO?

When sixteenth-century Jesuit missionaries encountered the *rancherías* (communal villages) of the Akimel O’Odham (the River People, also known as the Pimas) and the Tohono O’Odham (the Desert People, also known as the Papagos), they could not believe that these people could be descendants of the Hohokam because of the wretched nature of their settlements. Their simple brush houses surrounding a central ramada (and kitchen area) did not evidence the sophistication of the ruins found at Snaketown, Casa Grande, and Pueblo Grande with their elaborate ball courts and platform mounds. Most archeologists now accept the likelihood that the River and Desert People were direct descendants of the Hohokam. Both shared the same Uto-Aztecan language, and Hohokam means “those who have gone” or “wasted away” in the Akimel O’Odham dialect. Many Pima legends refer to the Hohokam. Indeed, one legend claims that a Pima revolt resulted in the destruction of all of the Hohokam platform mounds. Furthermore, some Hopi clans claim that that their ancestors migrated northward to Hopi-land after having lived previously in southern Arizona. Some scholars also suggest that the Yuman groups located in southwestern Arizona are kin to the Hohokam. It is now nevertheless generally accepted that while many Hohokam may have migrated away, both the Akimel O’Odham and Tohono O’Odham are the lineal descendants of the ancient Hohokam.

—John S. Leiby

appears that shamans assisted them in connecting to the holy people or spirits whom they depicted in their murals.

By about 1450, the Hohokam had abandoned all of their major villages. One of the suggested causes may have been soil salinization, which they had overcome in previous epochs but may have become increasingly insurmountable during the Late Classic period. Another (probably more plausible) reason tendered by many is climate change: droughts and floods. Tree-ring data indicate that Hohokam lands underwent massive floods in 1358 and again in the 1380s. Other theories concerning the decline center around warfare, European-introduced diseases

(although many discount this explanation, as the Hohokam had already reached their nadir by the time of the arrival of the Spaniards), and overpopulation (many excavated remains indicate the presence of malnutrition). Whatever the factors that led to the demise of this civilization, the Hohokam became the “people who wasted away.” Or did they?

The Pueblo and Cliff-Dweller Peoples of the Four Corners

The Anasazi—“enemy ancestors” in Navajo (although others claim that it means “ancient ones”)—are largely regarded as the ancestors of the modern Pueblo tribes of the American Southwest. Most scholars regard the Anasazi heartland as encompassing the southern Colorado Plateau and the upper Rio Grande drainage. Before 500 CE the Anasazi populated—took shelter—in caves and along rock overhangs. Yet as water tables rose and arroyos filled with sediment, agricultural yields multiplied, which spurred the construction of more permanent communities located on mesas above flowing rivers and streams.

Expansion of Anasazi towns resulted in the construction of more elaborate pit houses, which could number 100 in a single town. The movement to maize production led the Anasazi to grow other crops (such as beans and squash) and to domesticate such animals as turkeys. With these changes, by the tenth century the Anasazi had ceased to be basketmakers and instead were the producers of ceramic vessels, which signified the continuing evolution toward a sedentary lifestyle.

➤ WHERE DID THE ANASAZI GO?

The general decline of the Anasazi intensified during the last quarter of the thirteenth century. While the immediate cause for this decline can be attributed to the protracted drought between 1276 and 1299, it appears that other factors such as internal warfare among clans also contributed to the eventual abandonment of Anasazi sites. The surviving Anasazi fled to new locations, which today are known as the pueblos.

From about 1300 to 1450, Pueblo Indians (so-named by the Spanish) underwent a Golden Age of evolution within their new locations. The western pueblos—namely the Hopis (Arizona) and Zuñi (New Mexico)—saw a flourishing of their pueblos, especially in the spiritual arena. The eastern pueblos were also able to grow and flourish during this same epoch. They included Acoma and Laguna (located on the high plateaus of west-central New Mexico) and those located along the Rio Grande (Taos, Isleta, Jemez, Nambé, Picurís, Pojoaque, Santa Clara, San Ildefonso, San Juan, Sandia, and Tesuque). Other pueblos grew

and prospered for a time between 1300 and 1450, such as in Verde Valley, the Tonto Basin, the Salt River Basin, and portions of the Hohokam heartland (located in central and northern Arizona and northern Mexico). Yet these newer pueblo communities waned after 1450.

After 1450 the decline of the pueblos accelerated so that by the time of the coming of the Spaniards, no Pueblo Indians resided in any part of the Southwest with the exception of those inhabiting communities near the Rio Grande (central New Mexico), in Acoma, in the Zuñi heartland, and the Hopi villages farther west. The Pueblo Indians, like the Anasazi, had built kivas, which led to the Pueblo Kachina cult that flourishes today within the Hopi and Zuñi. The kachinas depicted in dance are not gods but rather divine beings so that mankind can find a bridge to the gods. It seems likely that most contemporary kachina dances originate from the dances/rituals of the Anasazi.

—John S. Leiby

The period spanning 1000–1150 is regarded by many archaeologists as the heyday of Anasazi society. The Kayenta—one of the branches of the Anasazi—settled across the entire Colorado Plateau, controlling all of the Grand Canyon and as far as the upland of northern Black Mesa. During this epoch, what many archaeologists call the Chaco Phenomenon occurred in an area roughly 10 miles (16 kilometers) in circumference in northwestern New Mexico. This evolution, however, largely bypassed the Anasazi of northern Arizona. There arose within Chaco Canyon during that epoch a cluster of communities/pueblos integrated by a network of converging roads. Richard Wetherill, an early Chaco Canyon archaeologist, counted within the canyon 11 large pueblos, or houses, each of which contained between 100 and 500 rooms. By 1100, Pueblo Bonito, which was located within Chaco Canyon, was a huge D-shaped complex of 800 rooms rising several stories. Many scholars surmise that the Chaco Canyon settlements indicate that the Anasazi experienced a much more elaborate stratified society as the pueblos grew; a

more hierarchical society would have evolved in tandem with the need to supervise the agricultural economy needed to feed the many mouths within these settlements.

Common to all Anasazi communities were subterranean kivas, or ceremonial chambers, whose small openings were (and still are) believed to be humanity's doorway from the underworld. Chaco Canyon's kivas (especially at Pueblo Bonito), however, were built on a much larger scale, which relates to an increasing reliance on a priesthood. This meant that Anasazi shamans gained greater power during the period from the tenth to the mid-twelfth centuries. Chaco Canyon's expanse would have necessitated agricultural surpluses obtained either from the productive capacity of its pueblos or via trade with outlying (perhaps even more distant) communities.

Most archaeologists believe that the Chaco Phenomenon petered out by the mid-twelfth century. The explanations for this collapse include protracted droughts, overpopulation, depleted resources, religious discontent, civil/political strife

within the Anasazi communities, and even perhaps actual warfare among various Anasazi settlements. The population scattered, which led to the construction of other (though smaller) Anasazi pueblos, such as the village of Aztec (misnamed by early Anglo settlers) along the banks of the Animas River, a few miles below the Colorado state border. During the thirteenth century the San Juan/Mesa Verde people emerged and built their small pueblos on mesas and talus slopes in southeastern Utah and southwestern Colorado. Even today some remain, including the famed cliff dwellings of Mesa Verde that were abandoned by the late thirteenth century. To the west, in northern Arizona, southern Utah, and southeastern Nevada, the Kayenta branch of the Anasazi built their own elaborate cliff dwellings. Yet like their Mesa Verde counterpart, the

Kayenta abandoned most of their villages by the end of the thirteenth century and scattered into the communities now called Southwest Indian Pueblos.

Economics and Economic Activity

Every schoolchild in the West has heard about Marco Polo (ca. 1253–1324). Were it not, however, for a fortunate incarceration following his capture in 1298 in a war with Genoa and his chance meeting with a writer of romances, Rustichello of Pisa, during that period of enforced inactivity, Polo, his father, and uncle would be largely lost to history. It was Rustichello who took Polo's rambling, often disjointed oral account of his adventures in Asia—adventures whose basic validity cannot be doubted, despite the narrator's obvious self-puffery, exaggeration, and sometimes faulty memory—and turned it into a fourteenth-century best-seller. Even if these three Venetian merchants were unknown to us, we would still have plenty of evidence of direct Western European economic (and missionary) activity in China during the latter part of the thirteenth century and the early fourteenth century. The Polos were just three among many.

The riches of China and the rest of the so-called Indies had been a lure for merchants from all over Afro-Eurasia for centuries. Western Europeans were simply late in joining the rush.

But the economic realities of Afro-Eurasia (and of the rest of the world) were far more complex than the search for luxury items. Luxury items were but a small part of the vast array of goods produced and distributed during these five centuries. What we can and should say is that Afro-Eurasia's economy was broad-based and vigorous, despite periodic downturns, and likewise the economies of the Americas and Oceania were healthy.

As noted in the introductory essay for the theme "Society and Culture," the economic basis for all settled societies was agriculture, whereas nomads depended primarily on their herds, while the world's small number of hunter-gatherers depended on the riches of nature. But while all of that was true, commercial and industrial productivity was on the rise, especially in Afro-Eurasia and the Americas, through much of this period, and both were vital to the economies of the various states around the world. Some states, such as the trading empires of sub-Saharan West Africa, emerged or at least grew larger and more powerful when their monarchs proved able to control and tax commercial transactions.

Indeed, sub-Saharan Africa enjoyed an unprecedented surge of economic activity, with routes across the Sahara and into the savanna regions of West Africa providing avenues for manufactured goods, horses, textiles, salt, books, and a wide variety of other commodities, which were largely exchanged for gold and slaves. But that was not the only area of Africa south of the Sahara to prosper from trade. Along the Swahili coast of East Africa, trading cities reached deep into the forest and

savanna interior, largely through the intermediary help of inland centers such as Great Zimbabwe, to extract items such as ivory that would then make their way to ports throughout the Indian Ocean and its adjacent bodies of water. Indeed, because of its superior quality, Chinese and even Indian artisans preferred African elephant ivory over that of India.

The Mediterranean, the meeting place of three civilizations—Islam, Byzantium, and Latin Europe—witnessed Italian merchants, especially Genoese, Pisans, and Venetians, becoming a major force in the economic life of this sea, especially from the late eleventh century onward. As in sub-Saharan Africa, empire building followed commercial success but in different ways. Both Genoa and Venice gained political control of vital commercial centers in the eastern Mediterranean and the Black Sea in the course of the thirteenth and fourteenth centuries.

Commerce could only flourish when there were sufficient goods to trade. In addition to transporting and selling the high-profit luxury goods of South and East Asia, such as spices, dyes, and silks, the merchants of Cairo, Damascus, Constantinople, Marseilles, Venice, and numerous other Mediterranean entrepôts also drew from products produced closer to home, such as wine, olive oil, silks, fine tapestries and brocades, steel, and a wide variety of both high- and low-bulk items. If there was a demand for it, it was produced and traded.

During the fourteenth century and thereafter, following the lead of the Byzantines and Seljuk Turks before them, the Ottoman Turks made careful fostering of their commercial and industrial economy a state priority. Consequently, the Ottoman empire grew fabulously rich during its early centuries.

The fabled Silk Road (which was only so-named in 1877 by a German geographer, Ferdinand von Richthofen, who preferred the plural “*die Seidenstrassen*,” whereas in English most scholars use the more romantic singular) continued to provide numerous (and often shifting) caravan routes across the heart of Eurasia, linking China, Japan, and Korea with the Mediterranean and beyond. However, due to its inherent dangers and the high cost of transshipping goods through many hands and across many thousands of miles of deserts, steppe, mountains, and forest, sea routes through the Indian Ocean and adjacent seas began to replace these land routes from about the eleventh century onward as naval technology improved to the point of providing better craft and navigational aids. During the age of Southern Song (1127–1279) and throughout the Yuan era (1279–1368), Chinese merchants sailing out of southern Chinese ports became a fixture in the Indian Ocean, where they met and traded with Arabic-speaking Jewish merchants from Egypt, East Africans and Malays, Indians, Arabs, Persians, and even the occasional Western European. Although there were many ports of call and centers of vibrant trade throughout the Indian Ocean, South India, which can rightly be termed “the bazaar of Afro-Eurasia,” drew the heaviest concentration of foreign merchants, including the Chinese. Ibn Battuta, a Moroccan who traveled through the port city of Calicut in southwestern India in 1341, recorded that some of the merchant junks from China that visited India had four decks, 12 bamboo sails, and numerous private cabins and salons. The ships carried a complement of

600 sailors and 400 men-at-arms. Even allowing for possible exaggeration, the sheer size of these ships, which probably had been dispatched for both diplomatic and commercial reasons, speaks volumes for the amount of commerce that the Chinese conducted in the Indian Ocean.

Thanks to the so-called Mongol Peace of circa 1250–1350, the land routes of the Silk Road became safer and surer than they had been for centuries, providing direct avenues for Western European merchants (and missionaries) to China, and for a short while small diaspora communities of Latin European merchants sprang up in Mongol-dominated China. Among these, the Genoese were especially prominent. With, however, the expulsion of the Mongols from China in 1368 and a number of concomitant other problems, such as the Great Eurasian Pandemic and the devastation across Central Asia wrought by the armies of Timur-i Leng, these diaspora communities withered away, and direct overland travel between Europe and China became a distant memory. As noted in the introductory essay for the theme “Politics and Statecraft,” however, Samarqand under Timur and his successors became a new focal point for trans-Eurasian commerce. Because the amir had also forcibly transported large numbers of artisans from all over Central Asia and beyond to Samarqand, the city also became noted for the high quality of its hand-crafted products.

High-value, hand-crafted items are an important part of any economy, but mass-produced, widely needed industrial products must drive any economy that claims to be complex. Without a doubt, China was the economic giant so far as both commerce and industry were concerned during this 500-year period, and its industrial capacity was unparalleled in the world. Traditional Chinese crafts, such as silk and ceramics, not only attained their highest levels of artistry but also became large-scale factory industries producing a high volume of silk textiles, fine porcelains, and everyday ceramics for expanding export and domestic markets. Textile machines that multiplied many times over the labor of a single worker became the norm in China’s textile factories, especially during the Song era. Papermaking also flourished under workshop conditions, meeting the high demand of bookmakers and printers of documents and money. Heavy industry, especially iron production (as well as some high-quality steel), grew at an amazing rate, with the region around the city of Kaifeng producing more iron than anywhere else on earth by the late eleventh century. Many iron-smelting and steel-producing factories were located close to huge coal deposits, which, as was also the case with salt production, was a major government-managed and taxed extraction industry.

Coal and coke were used in the production and fabrication of these and other metals, and China was the only place in the world at this time using these two hot-burning fuels in the production of industrial metals.

All of this large-scale industrial and commercial activity fueled an urban explosion throughout China, one that was without precedent to that point in human

Heavy industry, especially iron production (as well as some high-quality steel), grew at an amazing rate, with the region around the city of Kaifeng producing more iron than anywhere else on earth by the late eleventh century.

history. Without a doubt China was the most urbanized country in the world, with the largest number of megacities. Hangzhou, the capital of Southern Song (1127–1279) and a major mercantile center, probably had a population of about 900,000 in 1270. The city, located in the Yangzi Delta, was noted for its huge warehouses that stood alongside a large constructed lake. In like manner, large numbers of moderate- to large-scale provincial cities grew and prospered in this economic atmosphere, and even larger numbers of market towns sprang up in more distant rural areas. That noted, however, we should remember that most Chinese lived directly on the land and drew their livelihood from it. As with all premodern societies, the basis of China's wealth was still land and its products.

Outside of Afro-Eurasia products were still hand-crafted, and geographic distance and barriers often were formidable but not insurmountable obstacles to long-distance interchange, as the trade networks of Oceania and the Americas make clear. As people around the world demonstrated during this 500-year period, although modes of production, products, and methods of distribution and exchange might differ from culture to culture, economic activity is an essential human endeavor.

—Alfred J. Andrea

■ Introduction: Sub-Saharan Africa— Not as Isolated as Many Suggest

An eminent world historian once remarked that sub-Saharan Africa was peripheral to world history until the modern era. This is a wrong-headed judgment that has no foundation in historical reality. It is certainly not true in regard to economic interchange.

During the period 1000–1500, Africa south of the Sahara was involved in a tremendous amount of regional, transregional, and even intercontinental exchange of goods (and the ideas that traveled with them) in ways that not only precipitated significant cultural adaptations and shifts in a number of African societies but also greatly influenced and enriched the world beyond Africa's shores.

The essays in this section underscore three of the many forms of economic activity that were of primary importance during this half millennium: trans-Saharan trade from and into the savanna empires of West Africa; Great Zimbabwe; and the Swahili cities of coastal East Africa.

If the network of caravan routes that crisscrossed Eurasia has been labeled the Silk Road,

the dromedary-caravan routes across the western Sahara might well be termed the Salt and Gold Roads because these two commodities—salt from the north and gold from the south—defined the trade along them. In 1375 Abraham and Jehuda Cresques of Mallorca crafted a map of Afro-Eurasia subsequently known as the *Catalan World Atlas*, in which they depicted a road of gold stretching across Africa from southwest to northeast, and close by that road the fabled but very real monarch of Mali, Mansa Musa (r. 1312–1337), is shown holding a huge nugget of gold. Of course, as we learn from the lead entry on this topic, salt and gold were not the only commodities exchanged across the Sahara. Trade items included, but were not limited to, cotton and silk textiles, tanned leather goods and pelts, ivory, horses, books, and, tragically, slaves.

Just as these caravan routes connected interior West Africa south of the Sahara with the Mediterranean and beyond, interior East Africa south of the Sahara was connected to the vast ecumene of the Indian Ocean by reason of Great

Zimbabwe and the Swahili cities of the coast. At its apogee in the thirteenth and fourteenth centuries, Great Zimbabwe was the nexus of an extensive agricultural and commercial network, and it seems likely that it was the emporium through which gold, ivory, and other highly valued items (including slaves) were brought to the coastal cities and from there to Arabia, Persia, Iraq, India, Southeast Asia, and even China. On their part, the elites of Great Zimbabwe were able to secure precious trade items from these distant lands. On a more local level, Great Zimbabwe also functioned as a center for local exchange, especially trade in livestock.

The coastal cities of East Africa, which received goods from such interior centers as Great Zimbabwe, enjoyed an economic revolution between 1000 and 1500, and the greatest of these cities was Kilwa, an island port-city off the coast of present-day Tanzania. As Islam made deeper inroads into these cities, book production as well as trade helped drive their economies, and Kilwa also had a textile industry. Ibn Battuta, who visited Kilwa in 1331, complimented the city on the beauty of its houses and its inhabitants for their Islamic piety.

Tied in as these coastal cities were to the vast world of Dar al-Islam, it is no wonder that until the arrival of the Portuguese in the sixteenth century, they flourished commercially and culturally. It is also not surprising that trade wares from faraway China, as well as from closer locales, proliferate within their archaeological sites.

—*Alfred J. Andrea*

Horses, Salt, Manufactured Goods, Islamic Books, Gold, and Slaves—What Was Traded across the Sahara and Why?

Trade across the Sahara Desert originated in the last millennium BCE. Rock art from the Sahara itself, as well as written documents from North Africa, provide evidence for long-distance trade utilizing oxen-drawn carts, which were used to bridge the distances between the desert's scattered oases and the better-watered regions of the savannas in the south and the Mediterranean coast in the north. Though little is known about this early trade, it is believed that the key trade

➤ WHERE WERE THE GOLD MINES OF WEST AFRICA?

Prior to the discovery of the Americas by Europeans, the vast majority of the gold in circulation in Europe and the Middle East came from West Africa. Merchants and scholars in these regions knew that the gold came from somewhere south of the Sahara, but exactly where and how was a mystery. In the tenth and eleventh centuries, for example, Arab geographers wrote that the gold grew in the ground like carrots and was plucked from the soil each dawn. Such myths were obviously the result of ignorance. Since the production of gold was controlled by local Africans, knowledge as to its location was closely guarded.

The truth was far less fanciful. West African gold is alluvial, meaning it is deposited over a wide area in tiny flakes. Nuggets are rare. The gold was collected by excavating large pits in areas where alluvial soil had previously been deposited and then panning the soil to remove the heavy gold flakes. The two regions that accounted for most West African gold were the Bambuhu/Bure and Akan goldfields. The Bambuhu/Bure fields were located near the headwaters of the Niger River in present-day Guinea and Mali. The Akan goldfields were centered on the Black Volta River in what is now Ghana. Both regions are heavily forested and lay outside the borders of the great savanna empires of Ghana, Mali, and Songhai.

—*Jonathan T. Reynolds*

goods included finished works of iron and bronze as well as the region's core trade goods of salt and gold.

As western savanna urban centers such as Kumbi Sallah, Jenne-Jeno, and Goa began to expand rapidly in the first millennium CE, demand for salt in the region grew, just as the rise of Rome in the Mediterranean fostered more demand for West African gold. The introduction of camels across the savannas from the Upper Nile region around 300 CE revolutionized trans-Saharan commerce, since these desert-adapted animals could carry heavier loads greater distances across more forbidding terrain than oxen could cross.

By the second millennium CE, the trans-Saharan trade had expanded both in size and scope. Caravans of well over 1,000 camels were

not uncommon, and the range of goods transported by these expeditions was remarkable. Gold and salt remained key components of the trade, but as the demand on each end of the trade grew, so did the diversity of items exchanged. Exports from the savannas included cotton cloth, worked iron, copper, leather goods (from cattle, goat, and hippopotamus), ivory (raw and carved), animal pelts obtained from the forests to the south, and ostrich shells. Grains were also traded a shorter distance from the savannas to desert-dwelling communities living in the Sahara's southern half. Enslaved individuals were also a component in the trade from the south, though the rigors of the journey kept the numbers of captives relatively small (averaging perhaps 3,000 to 5,000 individuals per year), with concubines and eunuchs for the households of political and economic elites being the main focus of this aspect of the trade.

Items traded out of North Africa were in some ways similar to those traded north. Silk textiles and thread were popular goods, as were worked iron products. Small numbers of slaves from North Africa (and even as far away as Southern Europe) were also imported to serve in the homes of wealthy West Africans. By the thirteenth and fourteenth centuries, two trade goods in particular were beginning to stand out as key components of the trade: horses and books. As western savanna states such as Ghana, Tekrur, and Mali grew in size and influence, so did their desire for military power. The open terrain of the savannas was well suited to cavalry, which allowed states to project power quickly across large distances. However, because of the presence of trypanosomiasis (sleeping sickness), a disease particularly hostile to horses, it was difficult for savanna communities to breed their own mounts. As such, the demand for horses was huge, and owning horses became a marker of elite status for wealthy members of the savanna societies, just as it did in places such as China and Europe.

Books grew in significance as a component trade following the pilgrimage of Mansa Musa, ruler of Mali, in 1324–1325. Musa returned from Mecca with a desire to expand Islamic learning within Mali. He brought not only books but also

scholars and architects with him upon his return. His patronage of education fostered a growing demand for scholarly materials, and books on theology, jurisprudence, medicine, and other topics became a major component of the trans-Saharan trade. However, by the fifteenth century, scholars in the region were often copying and producing works of their own, allowing the region to export its own books to other parts of West Africa. These texts were not only produced in Arabic but also used Arabic script to write in local languages, such as Mande, Bamana, and Hausa. Often referred to as the “library of Timbuktu,” these books actually found homes in mosques and homes across the savanna region. In recent years, the discovery and electronic storage of these texts have provided considerable insight into the intellectual history of the region.

Great Zimbabwe as an Economic Entity

There is general scholarly consensus regarding much of the history of Great Zimbabwe, but questions and academic debates remain regarding the complex society behind these ruins. Some argue that Great Zimbabwe was inhabited from about 900 to 1450 CE and served as a thriving center of trade for more than 500 years. Others mark the development of Great Zimbabwe with the building of stone walls in the twelfth century and claim that it was occupied for only a little more than 200 years. Despite these differences, it is agreed that Great Zimbabwe existed as a key metropolitan area, significantly involved in farming, cattle raising, trade, and commerce. At its peak in the thirteenth and fourteenth centuries, Great Zimbabwe was the largest and most

powerful settlement in eastern sub-Saharan Africa, and the empire occupied an important trade position between the interior and the East African Coast.

Occupying roughly 1,800 acres (720 hectares), the ruins of Great Zimbabwe are situated 200 miles (320 kilometers) inland, almost directly east of the Indian Ocean coastal trading port of Sofala. At the height of power, Great Zimbabwe's reach extended from the edges of the Kalahari in the west to the outskirts of Sofala in the east. Most likely, the massive stone structures were built as status markers and as dwelling places of the elite whose vast wealth was derived from control of cattle, local gold and ivory production, and trade of these goods with Arab and Swahili merchants.

Great Zimbabwe's economy developed in part on regional and long-distance trade. People in the Great Zimbabwe region had been trading with Sofala prior to the development of Great Zimbabwe. Sofala's harbor was the oldest in southern Africa. By the early tenth century, Arab traders were visiting this coastal port in order to trade for gold from the gold-bearing regions of the Zimbabwe plateau. During the fourteenth and fifteenth centuries, Sofala remained a key southern outpost of the Islamic sultanate of Kilwa, and Arabs maintained trade relations with the Great Zimbabwe state. At Great Zimbabwe, the major administrative and commercial center elaborated a highly stratified society separated into hierarchical classes dividing common tribesmen from their rulers. These social divisions were demonstrated by the elites' choice of hilltop locales for their residences and the erection of enclosures of massive and impressive architectural design.

The villagers, or common people, of Great Zimbabwe did not enjoy luxurious lifestyles. Trade goods found mostly within the confines of the Great Enclosure demonstrate that mainly the elite families were able to import luxury items. Goods from India, China, and the Islamic world were imported to Sofala and sent into the interior. Excavated items found at Great Zimbabwe include a glazed Persian bowl from the thirteenth or fourteenth century, Chinese celadon dishes, shards from a Chinese stoneware vessel,

The Great Enclosure at Great Zimbabwe, most likely built by Bantu-speaking Shona. Great Zimbabwe, which comprises 100 acres of stone buildings, was the center of a thriving trade region up until the fifteenth century. (Corel)

➤ THE HISTORICAL PUZZLE OF GREAT ZIMBABWE

The origins of Great Zimbabwe are fully African, but questions about how this vast society developed and why it declined remain a matter of debate. For generations the abundant grasslands of the Zimbabwe plateau provided excellent grazing for cattle, allowing local pastoralists to grow wealthy with an ever-increasing number of cattle. However, poor soil conditions would not have supported the large-scale crop production necessary to feed Great Zimbabwe's population, so grain and other food staples were supplied by distant farmers. The plateau was rich with gold deposits, and the trade in gold clearly helped to develop the local economy and create prosperity; however, much of the gold trade occurred almost a century after the building of Great Zimbabwe. Thus, key questions asked by archeologists and historians familiar with the site remain unanswered: Why did a vast civilization develop in this location? How could such an influential power develop in an area so ill-suited for large-scale human habitation? Could cattle wealth and trade alone have afforded the inhabitants of Great Zimbabwe a superior way of life, or was there something else, a political or religious ideology, that gave them a competitive edge over neighbors and enabled them to harness the manpower necessary for the construction of the site? This remains the historical puzzle to be solved.

—Lorna Lueker Zukas

and fragments of engraved and painted Near Eastern glass. Other more common imported items include cotton cloth and Persian glass beads. Exported items included ivory, gold, leopard skins, iron, copper, wax, and other products. Production of crops and livestock also provided profit as they were sold along the trade routes.

Great Zimbabwe was part of the oceangoing trading networks of the Eastern Hemisphere that brought African goods to China and Chinese goods to Africa. Ships leaving Sofala sailed north along the Swahili coast to Kilwa and then along the Red Sea and the Persian Gulf, traveling to trading ports in India and through the Strait of Melaka (Malacca) to China. The rise of trade on the east coast of Africa coincides with the period of Great Zimbabwe's political dominance, and this is the period of greatest prosperity for the Swahili trading city of Kilwa.

The trading of gold from Sofala to Kilwa, on which Great Zimbabwe's wealth depended, reached its height in the fifteenth century and then went into a steep decline, precipitating the rapid decline of Great Zimbabwe as a political and mercantile center. The site was abandoned around 1450, perhaps as a result of declining economic opportunities coupled with environmental degradation as a result of overpopulation. As Great Zimbabwe declined, power shifted northward to new gold-producing regions on the Zambezi tributaries.

Trade on the East African Coast to 1500

Since at least the early centuries of the Common Era, coastal East Africans have been involved in long-distance trade. The first evidence of this comes from a work called the *Periplus of the Erythrean Sea*, a guidebook to Indian Ocean trade written during the first or second century CE in Greek by a merchant from Alexandria in Egypt. According to the book, trade with the East African coast was dominated by South Arabian merchants. They along with some Indian and Greco-Roman merchants sailed south on the monsoon winds to a place called Rhapta, where they exchanged iron, glassware, wheat, wine, and cloth for ivory, tortoiseshell, beeswax, and a few slaves. Judging from the *Periplus*, Rhapta was probably in either present-day Kenya or Tanzania. However, archaeologists can find no trace of Rhapta and presume that it was either situated near the mouth of a river that has since shifted and destroyed the site or was an annual trade fair site that came into existence only while the visiting merchants were there and not a permanent settlement. A few Roman coins have turned up in East Africa, but other than that there is not much archaeological corroboration of the trade described in the *Periplus*.

There is only modest evidence of trade in East Africa in the years between the *Periplus* and the year 1000. During that time, villages on the coast grew into towns, and beginning in the early eighth century there was a Muslim presence on the coast, probably resident Muslim merchants from Arabia. By the early tenth century there were large congregational mosques in several Swahili towns, and it appears that the majority of the coast's city dwellers were Muslims. Again, it appears that the root of this development was a growing number of Muslim merchants on the coast and the conversion of local African merchants to Islam. But it is unknown what goods were traded and the volume of that trade.

Between 1000 and 1500 the commercial life of the East African coast went through a revolution. The volume of trade increased as new trade routes to Central Africa brought gold from the interior to the coast, enriching the cities that

controlled the trade. The products of earlier trade, such as ivory, tortoiseshell, and slaves, continued to be exported, and trade became increasingly central to the economic life of the coast. Trade also seems to have increased the complexity of the local economy and triggered the growth of local manufactures and the local minting of coins.

Before the European discovery of the New World and the flood of gold and silver that came with it, Africa was one of the major sources of the gold used in Eurasian commerce. While the gold that came across the Sahara from West Africa is better known, East Africa was a major supplier as well. The gold that the Swahili cities sold to visiting Arab merchants came from mines in what is now Zimbabwe. Many states emerged in the gold-producing areas, but the best known of them was the one that produced the Great Zimbabwe, a huge stone enclosure that was probably a royal palace and fortress. Trade routes exceeding 500 miles (800 kilometers) in length reached from the goldfields of the interior to the coastal city of Sofala in present-day Mozambique. Curiously, Sofala never controlled the gold trade itself. It is so far south that ships that came from Arabia or from India could not be sure of getting home in a single monsoon cycle if they went all the way to Sofala. Instead they relied on merchants from more northerly cities to move the gold from Sofala to points on the coast that enabled them to get home in a single year. The city that dominated this trade the longest was Kilwa, which was situated about as far south as Arabian ships could get in a single year's monsoon cycle. Kilwa grew rich off this trade and became the biggest and most opulent of the Swahili cities.

Gold was the only commodity that had a supply chain that stretched deep into the interior. The other major trade goods—ivory, various other forest products, and slaves—were obtained closer to the coast, often from the Swahili's immediate neighbors. East African ivory has been in demand since antiquity in part because it is so easily worked and because it ages nicely. Although India has its own elephants, it was a major market for the superior African ivory because ivory bangles were part of a married woman's attire and usually were cremated with her at her

THE MITEPE

One of the big questions concerning the Swahili Coast during its commercial heyday (1000–1500) is whether Swahili merchants were primarily intermediaries between visiting Arab and Indian merchants and the people of the East African interior or whether they were involved in the broader trade networks of the Indian Ocean. In short, were they merchant-sailors or stay-at-home merchants?

They certainly had boats that were seaworthy enough to make it to Arabian ports. These were the famed *mitepe* (sing. *mtepe*) that plied East African waters from at least the fourteenth century until the middle of the twentieth century. *Mitepe* were built entirely without iron. Their hulls were sewn and pegged rather than nailed. *Mitepe* used sails woven from palm fronds rather than cloth sails. These boats were surprisingly seaworthy and in the nineteenth century were used to smuggle slaves to South Arabian ports.

Interestingly, there are no reports of these vessels being sighted in the major ports of the Indian Ocean during our period. There is a report of a merchant from Kilwa in Melaka (Malacca) on the Malay Peninsula, but it does not specify how he got there. Thus, it may be that the Swahili used their own boats at home but relied on others to move goods on the longer routes.

—Erik Gilbert

death. Thus there was a steady demand for replacement ivory to make these bangles. Slaves likewise were in steady demand, but the numbers exported seem to have been relatively low and sustainable in the sense that they were supplied locally for many centuries.

As coastal trade grew, the local economy became more complex. Some of the major towns began to produce their own coinage, something virtually unknown elsewhere in sub-Saharan Africa. In some cases these were high-value coins made from precious metals, but at Mtambwe on the island of Pemba, archaeologists have found a trove of tiny copper coins. These coins were low in value, which suggests that money may have been used for mundane everyday purchases as opposed to major transactions for which gold

and silver coins were used. Local manufactures also flourished during this time. Smiths produced high-quality iron and semisteel for local consumption and for exchange with the interior. There was a cloth industry, and in the city of Kilwa scribes copied and bound books for a regional trade.

Also during this period, trade goods show up in many archaeological contexts. Chinese porcelain was widely used to decorate tombs and even mosques. Perhaps the most telling sign of the ubiquity of trade goods during this time is that

even now when farmers on the offshore islands hoe their crops, they routinely turn up broken bits of Chinese porcelain. Trade had so thoroughly penetrated Swahili society that it left behind plenty of exotic trash.

■ Introduction: The Mediterranean and the Black Sea—The West's Portals to the Riches of the Indies

Both the Mediterranean and Black seas served as gateways for the West to the riches of Farther Asia since antiquity when, beginning in the eighth century BCE, Greeks established trading-posts and, later, colonies along the periphery of each. Indeed, Byzantium, which commands the entrance to the Bosphorus, the narrow, roughly 23-mile- (37 kilometer-) long strait that connects the Sea of Marmara with the Black Sea, was founded in this fashion in the seventh century BCE. To the Romans, of course, the Mediterranean was *Mare Nostrum* (Our Sea), essentially a huge salt-water lake that lay at the core of the empire, and the Black Sea remained its sea-water avenue to Inner Asia.

For military and economic reasons, as well as religious ones, Constantine I, the Great, transformed Byzantium (Byzantion) into Constantinople, the New Rome and capital city of his Christian Roman empire, in 330 CE. Moreover, Anatolia, which runs along the southern coast of the Black Sea, became the heartland of the Eastern Roman, or Byzantine, empire. As in Greco-Roman antiquity, the shores of the Black Sea were a key source of grain for the Byzantine empire. During the reign of Basil II, the Great (r. 976–1025), the Byzantines dominated the southern and western littorals of the Black Sea and also held the southern portion of the Crimea (the peninsula jutting into the north-central Black Sea

in present-day Ukraine). Despite the eleventh-century incursions of Turks into Anatolia, the Byzantines managed to hold onto control of most of the southern and western coasts of the Black Sea and their toe-hold in the Crimea until the late twelfth-early thirteenth century. Further advances by the Seljuks, the rise of the Bulgarian empire, the expansion of the Russian state, and the conquest of Constantinople by the Latins in 1204 severely changed the situation and drastically reduced Byzantium's hold on its Black Sea regions. Adding to this critical situation was the severe decline in numbers and sea-worthiness of the empire's naval and merchant fleets during the latter half of the twelfth century and following.

Just as the Byzantine empire was surrendering its hold on the Black Sea, however, Italian merchant powers, notably Venice and Genoa, were becoming a major factor in Black Sea commerce. Before its entry into the Black Sea, the Latin West first had to reestablish itself in the Mediterranean. The migrations by various so-called fringe peoples into western Europe between the fourth and tenth centuries, and their establishment of kingdoms and other states, broke the back of Roman unity and the Latin West's focus on the Mediterranean. Although direct Western trade in the Mediterranean did not cease totally, it declined to a trickle for several centuries, especially from the sixth through ninth centu-

ries. Jewish merchants known as Radhanites (*al-Radhaniyya*), with ties to a network of trade that stretched all the way to India and China, provided Western Europe with most of its relatively few exotic goods during the eighth and ninth centuries, and exported from the West such high-end commodities as slaves and furs.

The tenth century, however, began a long period of economic expansion for all three civilizations that bordered or were situated in the Mediterranean—Islam, Byzantium, and the Latin West. Islam's commercial cities along the Mediterranean coast stretched from Syria-Palestine to the Maghreb (western North Africa) and al-Andalus (Islamic Spain), making Muslim merchants the sea's dominant factors during the tenth and eleventh centuries. Yet, traders from Latin Europe's maritime cities, such as Amalfi in southern Italy, were able to become junior (yet valued) partners in this commerce. Special buildings for foreign merchants, known as *fanadiq* (singular *funduq*) in Arabic (transliterated to *fondaco/fondaci* by Italians), began to spring up, offering shelter, protection, and privileges to commercial itinerants. It also allowed governments to keep these outsiders (and often non-believers) under surveillance.

In time, the *fanadiq* evolved into "quarters," which at their best (or worst, depending on one's perspective) had their own officials and laws and even churches or mosques. Such self-governing mercantile quarters became especially powerful and important in the Latin crusader states' port cities after 1100 and down to 1291. Through these *fondaci* and quarters, West African gold and luxury items from the East, such as silks, cottons, spices, exotic woods, pharmaceuticals, brocades, and dyes, flowed in increasing volume into the West. Luxury items, however, were only part of the total volume of imported goods, as the introductory essay for the topics covering commerce and industry in the Indian Ocean will show.

The maritime cities of Latin Europe, especially Pisa, Genoa, and Venice, but not just these three northern Italian city-states, were growing demographically and economically, and their mercantile reach was expanding well before the First Crusade (1096–1099). In 1082, for example, Venice secured substantial commercial conces-

sions from the Byzantine empire, which awarded Venice the position of highly favored, untaxed trading partner, with an independent quarter in Constantinople, in return for its promised naval support against the Normans of southern Italy. Such rapid growth positioned these three Italian maritime powers to take full advantage of opportunities afforded by the crusades, and their opportunism established them as major economic forces in the eastern Mediterranean.

Opportunism also allowed these maritime powers to move into the Black Sea in a significant way, following the Latin conquest of Constantinople in 1204. Western vessels had traded in the Black Sea prior to 1204, but the establishment of the Latin Empire of Constantinople (1204–1261) opened it to unrestricted traffic by Western merchants, especially the Venetians, who were now firmly ensconced in Constantinople and other territories seized from the Byzantine empire. Joining the Venetians in this windfall were merchants from Pisa, Ancona, Amalfi, and Provence. Genoa, which had tense relations with Venice and whose quarter in Constantinople suffered diminution after 1204, played a minor role—at least for the moment. Following Mongol consolidation of southern Russia around 1240, the Venetians and other Western merchants were able to increase the range of their commerce both around the periphery of the Black Sea and farther eastward. In 1260, two Venetian merchants, Niccoló and Matteo Polo, the father and uncle of Marco Polo, passed through Constantinople to the southern coast of the Crimea and from there across Central Asia to the court of Khubilai Khan on the first of their two expeditions to China. The Black Sea was now fully integrated into the Mediterranean mercantile system, and Italian traders, taking advantage of the Pax Mongolica, were the driving force.

When Byzantium recovered Constantinople in 1261, the empire could not reverse the trend. Before 1204 it had controlled trade through the Bosphorus and with the Black Sea in order to protect domestic production, such as the silk industry of Thebes. But there was no turning back to pre-Conquest protectionism.

Genoa, which the restored Byzantine emperor looked upon favorably, was the chief beneficiary. Its quarter in Galata, which is situated

across the harbor of the Golden Horn, grew rapidly into a self-governing town. Even today, its nine-story tower constructed in 1348 dominates the skyline. Genoese merchants sailing from Constantinople became a fixture in the Black Sea. In 1266 they established a colony at Caffa in the Crimea. Close by was the Venetian trading center at Soldaia, and sometime in the 1260s the Venetians established a second entrepôt at Tana, which lay at the mouth of the Don River, thereby giving easy access to the heartland of Russia. Additionally, both Italian powers established trading centers along the southern coast of the Black Sea in an area known as Trebizond. Merchants traveling east and west along the northern Silk Road, made relatively secure by the Mongols, used these ports to transport silver to the East and exotica to the West. Upon disembarking at a Black Sea port, some Italian merchants traveled across Central Asia all the way to Cathay (northern China), where they established small diaspora communities. Many more traveled southeast from the Black Sea to Iran and Iraq and from there to

India and the Indian Ocean, and some went even farther east to southern China. Yet, such voyagers and their luxury goods were not the mainstay of merchant traffic across the waters of the Black Sea. Grain and other agricultural produce, timber, furs, and slaves provided the real profits for Genoese and Venetian merchant-mariners. Slaves were in high demand, especially for the armies, courts, and harems of the Mamluk sultans of Egypt and Syria and as laborers on eastern Mediterranean plantations, principally on islands possessed by Genoa and Venice. Tana, in fact, served as one of Afro-Eurasia's premier slave emporia.

By the mid-fourteenth century, fortunes were changing, and the Black Sea was becoming less hospitable for Westerners. In 1343 a massacre of Western merchants took place in Caffa, and three years later, it and Tana were besieged by Mongols from the Golden Horde. There is good reason to accept the traditional story that bubonic plague—the Black Death—which traveled from east to west across the heartland of Eurasia

in the 1330s and 40s, was carried to Europe by Latins fleeing these sieges. It is unlikely, however, that these were the only two points from which the plague reached the West. The Genoese rebuilt Caffa after the siege of 1346, but it and Tana were leveled by the forces of Timuri Leng (Tamerlane) in 1395. Rebuilt again, Caffa was lost to the Ottoman Turks in 1475; likewise, Venetian control over a rebuilt Tana ended sometime after the mid-fifteenth century. The Genoese and Venetian colonies in Trebizond also fell to the Ottomans during the fifteenth century.

If the Latin West wanted direct mercantile contact on a regular basis with the farther reaches of “the Indies,” it would have to find new routes.

—*Alfred J. Andrea*

The Mediterranean—Meeting Place of Three Civilizations

Despite ongoing wars and religious tensions, trade flourished in the medieval Mediterranean. Fur and wood from Scandinavia, ginger and cinnamon from Indonesia, gold and slaves from the Sudan and West Africa, copper and salt from Morocco, Frankish swords, English wool, Indian pepper, and Chinese silk all found their way onto vessels that sailed regularly between North Africa, Southern Europe, and the ports of the Levant, linking Latin Christendom, Byzantium, and the Muslim world in a global market.

Even before the crusades led to increased commerce, Muslim, Greek, and Italian merchants conducted an active trade in the eastern Mediterranean. As early as the mid-tenth century, Byzantine merchants sailed regularly from Constantinople to Alexandria and then up the Nile River to Fustat (Old Cairo), where they were allowed to establish a marketplace-residential building, called a *funduq* in Arabic. There they traded storax (a vanilla-scented gum resin used in medicines and perfumes), timber, and a highly prized Byzantine silk for expensive commodities from the Indian Ocean such as spices and dyes that had been shipped up the Red Sea, transported across the desert in caravans, and then floated down the Nile.

Conversely, Muslim merchants, especially Egyptians and Syrians, had also by the mid-tenth century established trading headquarters and

➤ “SPICES” TRADED IN THE MEDITERRANEAN

The term “spice” meant more than seasonings to medieval European merchants. It encompassed all sorts of raw materials. The following excerpt from a list of 288 “spices” compiled by Francesco di Balduccio Pegolotti of Florence in the first half of the fourteenth century suggests the wide variety of goods traded throughout the Mediterranean and their diverse places of origin.

Quicksilver
Castile alum
Anise
Sheet silver
Fresh oranges
Rose water
Alcohol
Cotton of Syria
Borax
Wax of Riga
Cultivated cardamons
Cinnabar
Paper of Damascus
Cassia bark
Red corals
Elephant tusks
Pistachios
Fennels of Tunis
Cinnamon flowers
Malabar ginger
Cloves
Gum Arabic
Frankincense
Mace
Myrrh
Coconut
Theban opium
Round [black] pepper
Pearls
Dried grapes of Armenia
Sugar of Cairo
India gingerbread

residences called *mitata* in the Byzantine capital of Constantinople. The imperial government even permitted the building of a mosque in the city for the use of foreign residents and visiting merchants.

The Italians, too, were active in the Levant well before the First Crusade (1096–1099). Merchants from Genoa, Pisa, Venice, and especially Amalfi had set up their own *fondaci* in Constantinople, Antioch, Jerusalem, and some North African ports. In 996 there was a popular uprising and massacre of Amalfitans in Fustat. Perhaps they were enraged at the presence in their midst of infidel foreigners who did not respect Muslim prohibitions against drinking wine and eating pork. Normally, however, even in the face of piracy, warfare, religious differences, and sectarian violence, trade was protected and encouraged by state officials, Egyptian and Byzantine alike.

The capture of Jerusalem, Acre, Tripoli, and the ports and hinterlands of the surrounding territories by crusaders led to a gradual opening up of new markets for Italian traders, especially the

Venetians and the Genoese. Both the Byzantines and the new Latin Christian rulers gave them important trading rights and concessions. In 1092 on the eve of the First Crusade, the Byzantine emperor Alexius I issued the Golden Bull, which allowed the Venetians to trade freely throughout the empire except in Crete and Cyprus and a few of the ports of the Black Sea; within a century more than 60,000 Italians were living and working in Constantinople.

Similarly, rulers of the new crusader states gave Italians extensive trading privileges in the so-called Latin East. In 1124, for example, in return for their assistance in destroying the Fatimid fleet in Egypt and leading an assault on Tyre, the Venetians were given a third of the city and exemption from customs duties. The Genoese had been given similar customs exemptions in Caesarea in 1101, where they helped the king of Jerusalem capture and sack the Palestinian port city, and earlier they had received extensive privileges for their crucial assistance in capturing Antioch in 1098. Pisa enjoyed special privileges at

Jaffa and Beirut in return for its naval support in capturing these ports. Other settlements were established throughout the Latin East and in Muslim and Byzantine lands by mariner-merchants from southern France, Catalonia, Dalmatia, and even Norway. Throughout the twelfth, thirteenth, and fourteenth centuries, raids and trading concessions gave way to the establishment of permanent mercantile communities. It is worth noting, however, that similar Muslim communities were not set up in the Latin West due to a combination of Christian intolerance and the fact there was plenty of room for lucrative Muslim expansion to the east, where local rulers and officials successfully blocked European access to overland trade routes except during the period of the Pax Mongolica (ca. 1250–ca. 1350).

Military and commercial aggression was by no means limited to the eastern Mediterranean. The crusading ideal was equally at play in Muslim Spain, North Africa, and the western islands, where Italian and Catalan adventurers worked up and down the coasts. In 1088 Genoese merchants captured al-Mahdiah, a large seaport in Tunisia, returning the city to its ruler under the condition that they be exempted from all tolls and taxes.

Nor was this emerging global market limited to gold and luxury items. War materials such as timber and iron were sent to Egypt even at the height of hostilities. Black Sea fish, East European and African slaves, Egyptian alum (used in the Italian textile industry), wool from the north, grain, wine, oil, and Cretan cheese were all transported and sold regularly throughout the region.

With the discovery of the sea routes to India by the Portuguese and to the New World by the Spaniards in the late fifteenth century, this global Afro-Eurasian market was extended to a worldwide scale, ultimately leading to the expansion of Europe, colonialism, and the modern international capitalist system.

Overland Trade in Anatolia Under the Seljuks

The Seljuks were a powerful Turkoman dynasty that established its dominance of Anatolia with the defeat of the Ghaznavids at the Battle of Dandagan in 1040. The Anatolian Peninsula (sometimes inaccurately called Asia Minor) had historically been a crossroad for Afro-Eurasian trade for millennia by reason of the Tin Road (inaugurated ca. 2700 BCE), the Persian Royal Road (from the sixth century BCE to the mid-sixth century CE), and the Silk Road, branches of which stretched to several of its port cities along the Mediterranean, such as Smyrna (present-day Izmir) and Antalya. As the Byzantine empire's control over Anatolia was weakening politically and militarily in the late eleventh century, the Seljuks assumed control of much of the overland trade through the peninsula, especially the significant volume of trade that passed through Konya.

The Seljuks developed and fortified their inland cities and attracted mercantile interests from as far away as Genoa, Pisa, Florence, and Russia. In order to facilitate trade and to ensure the safety of travelers from an inhospitable climate and

➤ A SELJUK CARAVANSARY

Throughout their overland trade routes, the Seljuks established caravansaries, or *hans* or *ribats* (religious fortresses), to assist travelers and merchants. Founded upon the Islamic principles of charity and hospitality, the caravansaries were located throughout Anatolia and Iran approximately every 19 to 25 miles (30 to 40 kilometers), or a day's journey, and provided up to three days of food, fodder, accommodations, and, in some cases, entertainment, for travelers. The word “caravansary” is Persian in origin, deriving from *karwan* (group) and *saray* (large inn). As the harsh desert and mountainous climates of the region made overland trade formidable, the earliest caravansaries were thought to have originated as a protective walled enclosure around a well or water supply. Furthermore, caravansaries offered safety from theft and robbery to merchants and their goods. Caravansaries consisted of a rectangular walled courtyard structure that was simple and plain in decoration except for the main portal door, which was generally ornate and decorated with Quranic calligraphy. The caravansary structure itself contained rooms and sections for various purposes including lodging quarters, storage depots, and stables. As caravansaries were charitable institutions, they were often built by imperial or wealthy patrons as pious endowments.

Courtyard and mosque of the Sultan Han caravansary near Kayseri, present-day Turkey. (Vanni Archive/Corbis)

Caravansaries in Anatolia often had at their centers freestanding mosques. The Great Han caravansary, the largest in Anatolia, was built by Sultan Aleyeddin Keykubad I between 1229 and 1236. Located near Kayseri, between Aksaray and Konya, this caravansary included separate areas for prayer, bathing, and sleeping and service areas for kitchen staff, physicians, and musicians. Many modern towns and roads of Anatolia are believed to be centered around medieval caravansaries.

—Ruma Niyogi-Salhi

theft along these trade routes, the Seljuks built caravansaries. These were charitable foundations that provided food, lodging, places of worship, and entertainment to travelers and merchants at intervals of approximately 19 miles (30 kilometers).

The arrival at the end of the eleventh century of European crusaders, who established states both within Anatolia (such as the county of Edessa) and along its periphery, greatly increased Anatolian trade. Europeans developed an acute taste for Oriental goods, Chinese luxury items, Islamic textiles and handicrafts, and even religious souvenirs that were traded in major inland Anatolian cities such as Sivas, Aksaray, and Kayseri. These cities were linked overland to the major trading centers in Tabriz (Iran), Baghdad, and Aleppo (Syria).

Although the Seljuks mainly imported their goods for trade to Europe, they did develop local industries for trade among themselves. Local trade within Anatolia was often handled by Armenians or Greeks living in the cities. The currency for trade was the *dirrbem*, and most of the coinage used by the Seljuks was struck at the mint in Konya. The Seljuks also accepted Fatimid coins, Syrian coins from Aleppo, and the Florentine *florin* as legal currency. More importantly, the Seljuks made extensive use of the Arabic and Islamic banking system of *bawala*, or trust, whereby money could be transferred at any place within Islamic lands by way of a handshake and verbal agreement, a system that continues to this very day in Islamic countries.

Major overland trade routes crossed Anatolia in all directions. Some have speculated that the

well-established paved roads of Turkey today follow the original medieval Seljuk roads. The Grand Road, or Ulu Yol, was an axis connecting Konya, Aksaray, and Kayseri. Other important routes included the High Road between Alanya and Konya, and numerous caravan paths led from Konya to the Mediterranean port cities in the south.

Overland trade in Anatolia was greatly weakened by the Mongol invasions of 1242–1243 that fundamentally destroyed sedentary life and the urban infrastructure in most areas. The Mongol conquest of much of Anatolia shifted the control of power to other Turkoman warrior clans of the frontier, most notably to the Turkish group led by Ertugrul (d. 1280) and his son Osman Bey, the founders of the Ottoman empire.

Trade under the Ayyubids and Mamluks

Muslim conquests during the seventh and eighth centuries had brought together a variety of formerly hostile regions under the control of the Islamic empire, or Dar al-Islam. Under the Umayyad (661–750) and especially the Abbasid (750–1258) caliphates, these territories were entwined more firmly together by three common factors: settled agriculture, urbanization, and long-distance trade. As new cities were created, they stimulated a demand for all kinds of goods, from timber to food and from clothing to luxury items. Cities depended on agricultural areas to produce surpluses to match the increased needs of the growing population. This need was met by the arrival of new crops and farming techniques, which significantly changed agriculture throughout Eurasia.

While many regions had been connected by ancient transcontinental-transoceanic trade routes, under the banner of Dar al-Islam the east-west exchange of goods and technical achievements expanded significantly. Merchants, soldiers, missionaries, diplomats, and adventurers traveled across the Muslim realms and by so doing encountered new foods, fashions, architectural styles, military strategies, and other goods and ideas. The eleventh, twelfth, and thirteenth centuries brought waves of invaders to the Middle East, including European crusaders and Asian Mongols. Despite the warlike intentions of both groups, each served to stimulate trade by introducing new goods and technologies and consolidating existing trade routes.

When Saladin, the great Muslim hero of the crusades and founder of the Ayyubid dynasty (1171–1250), died in 1193, he left his descendants a rich empire that was strongly positioned to dominate the trade routes of the medieval world. Economically, the Ayyubid period was one of growth and prosperity, particularly in Egypt. The Ayyubids oversaw a major rise in the status of Egypt in the Sunni world. The capital city of Cairo became not only an economic center but also the cultural and intellectual center of the Muslim world. Building on the policies of the

➤ DAMASCUS—CITY OF STEEL AND COMMERCE

Syria lies at the crossroads of the Old World, with routes extending east to India and China, west to the Mediterranean and Europe, north to Central Asia and Russia, and south to Africa and the Indian Ocean. Intercontinental and transoceanic trade in necessary and luxury goods produced great wealth for the inhabitants of its cities, particularly Damascus. As a result of its enviable position between ancient and medieval civilizations in the East and West, Damascus was uniquely suited to lead developments in many key industries. Under the Umayyad caliphate, which made Damascus its capital, and the Ayyubid caliphate in Baghdad, Damascus was a leader in several of the most technologically dynamic industries, including glass, ceramics, fabric, and metalworking. Damascus became especially famous for two developments. The first was a new kind of fabric, damask, that was named after the city and contained elaborate patterns woven into cloth. The second was Damascus steel used in Middle Eastern sword making from around 1100 to around 1700. Syrian swords were of an almost mythical sharpness and strength and were purportedly able to cut through the crusaders' European swords and even rocks without losing their edge. Although modern sword smiths are sometimes able to mimic the complex designs found on the surface of medieval Damascus steel, the actual technique for making these legendary swords remains something of a mystery.

—Julie T. Abouzelof

previous Fatimid dynasty (969–1171), the Ayyubids succeeded in firmly shifting the axis of east-west trade from Baghdad to Cairo. Because they controlled Yemen, the dynasty had control over the Red Sea and Persian Gulf. This gave the Ayyubids an important commercial and strategic advantage over other Muslim dynasties by allowing them to dominate the spice and incense trade.

The east-west trade routes controlled or used by Muslim merchants were responsible for introducing a variety of specialized goods and new ideas to the medieval world. For example, China was known for its fine porcelains, silks, horses, jade ornaments, tea, camphor, and other luxury items. Likewise, India exported all manner of

crops, from henna to apricots to cotton, as well as a variety of precious stones. The various islands of the Indian Ocean traded in spices, scents, and tortoise shells. Many of these goods were brought to the West along the ancient Silk Road. Italian, French, and Catalan merchants in the eastern Mediterranean used ports under Ayyubid control as well as port cities in the crusader states. These merchants exported goods produced throughout the Middle East and along the Indian Ocean, including fabric, ceramics, glass, and spices, to anxious markets in Europe. Trade also flowed east, spreading European goods such as timber, amber, and fur to cities in western and central Asia. The trade routes of Dar-al-Islam extended south to West and East Africa as well from which slaves, gold, and exotic pelts and ivory from sub-Saharan Africa were exchanged for goods from other regions.

The Mamluk dynasty (1250–1517) succeeded the Ayyubids as the primary military and economic power of the Sunni world. During the Turkish Mamluk period (1250–1382) the new rulers of Egypt continued many of the favorable trade policies initiated by their predecessors. For example, commercial relations between Venetian and Genoese merchants and the Mamluks remained largely friendly despite lingering hostilities between the Muslim and Christian realms caused by the crusades. However, during the Circassian Mamluk period (1382–1517) local and international trade declined significantly. The Mamluk monopoly on the spice trade in the Indian Ocean was eventually taken over by the Portuguese, and other Mamluk trade monopolies were increasingly threatened by the Ottoman empire from the mid-fifteenth century onward.

Possibly the best primary sources for information on trade during the Ayyubid and Mamluk periods can be found in the business and personal documents of Jewish merchants from the Cairo Geniza. Jewish religious beliefs dictate that any writing that contains the name of God should be buried like a human body in a repository known as a *geniza*. The Cairo Geniza preserved almost 200,000 documents spanning eight centuries, including the correspondence of merchants extended across all the main ports of the Mediterranean and the western and central Indian Ocean. The Cairo Geniza was opened in

1890 after being discovered during a renovation following a fire, and its contents were then scattered to libraries and private collections throughout the world. Scholars are indebted to S. D. Goitein's massive *A Mediterranean Society: The Jewish Community of the Arab World as Portrayed in the Documents of the Cairo Geniza* for bringing together and interpreting thousands of these documents. The most well-known items date from the second part of the tenth century to the end of the thirteenth century and cover the Fatimid and Ayyubid periods as well as the entire crusader era. Unfortunately, many of the documents dating from the Mamluk and later periods appear to have disappeared into private collections and are not as readily available as those from earlier periods.

Genoa, Pisa, and Venice— The Big Three of Italian Maritime Commerce

A quick glance at the histories of the three greatest maritime commercial cities of medieval Italy—Venice, Genoa, and Pisa—reveals clear distinctions in terms of origins, geographical placement, and initial economic focus. In a global sense, however, their internal developments and external interests emerge as strikingly similar. In fact, their similarities, rather than their distinctions, drew all three cities into conflicts with each other. The disputes played out through diplomacy, military action, and economic competition and ultimately undermined each city's stability.

Pisa and Genoa had ancient origins as urban sites, but Genoa's population and relevance declined along with the weakening of Roman authority in the West. Pisa, in comparison, managed to thrive during the tumultuous years of Ostrogothic, Byzantine, Lombard, and finally Carolingian dominance. In the eleventh century, Pisa fought with neighboring Lucca for independence, won that war, and started a period of considerable expansion at the expense of Muslim powers in southern Italy and the islands of the western Mediterranean. With the removal of Muslim pirates and the capture of treasuries in places such as Palermo and Corsica, Pisa began to assert its economic power regionally. The city also began ambitious construction projects, reshaping the physical profile of the city. Like Genoa and many other cities of Italy, the newly impressive Pisa went through an internal political transition that left a commune, or a group of citizens who elected their leaders, in control.

But just as the commune of Pisa was reaching new heights of authority and economic prosperity, Genoa emerged first as an ally then as a rival. Like Pisa, Genoa was technically part of the Holy Roman Empire, but imperial oversight was only sporadically enforced over such cities. Genoa emulated Pisa in exploiting the relative weakness of nearby Muslims as the second millennium began, turning the tables on the Islamic forces that had sacked the city repeatedly over the previous centuries. In 1016, Genoa defeated the Sardinian Arabs. Based on that success, the Genoese accelerated their program of economic expansion, bringing themselves increasingly into contact, cooperation, and ultimately dire conflict with Pisa.

Venice's history evolved differently. Although people had long harvested salt from the Venetian lagoon, the city itself incorporated when refugees from the Lombard invasion of 568 fled to the islands in the marsh in order to take advantage of the protection of Byzantine ships. Centuries later, Byzantium needed Venice's help at sea, and the Italian city sent its ships to protect the Greeks against the Normans of Sicily. In either 1082 or 1092, as a reward, the Byzantine emperor Alexius Comnenus (r. 1081–1118) granted Venetian merchants a complete exemption from tariffs for goods passing through Constantinople.

➤ GUGLIELMO PORCO (BILLY THE PIG)

The conflict between Venice and Genoa lasted for centuries, involved direct economic and military contests, and sometimes drew in other major powers in unexpected ways. When Venice assisted other Latin crusaders in the conquest of Constantinople in 1204 as a result of the Fourth Crusade, the resulting Venetian influence in the Aegean and the new Latin empire of Constantinople severely threatened Genoese interests. Venice acquired the island of Crete from Marquis Boniface of Montferat, one of the leaders of the crusade, a powerful northwestern Italian noble, and ironically a former ally of Genoa. The Genoese sent a delegation to Venice and demanded that their rivals either relinquish their claim to the island or face war. Venice refused to acquiesce.

But how to fight the Venetians? The city was still at war with Pisa and did not want to engage in hostilities directly. Instead, the Genoese turned to its citizens to serve as privateers. Guglielmo Porco and Enrico Belamuto, elite citizens of Genoa, mustered six galleys and set out for the Aegean in order to harass Venetian ships and try to limit the gains of the Republic of St. Mark. As luck would have it, Porco seized a ship in the late summer or fall of 1204 bearing the Templar brother Barozzi. A Venetian and the master of the Temple of Lombardy, he was an emissary from Emperor Baldwin of Constantinople to Pope Innocent III. The privateers released Barozzi and sent him on his way but kept the rich haul of gems, jewelry, gold and silver altar ware, and relics that had been intended as gifts to the pope and the temple.

Innocent III was furious, not because of the piracy but because gifts that belonged to him had been taken. He threatened the city of Genoa with interdict unless the items were returned. Genoa was never placed under interdict, so we must suspect that the precious and sacred items were returned.

—David Perry

This Golden Bull (*chrysobull*) helped to propel Venice's economic activity to new heights while also resulting in the development of a permanent self-governing Venetian colony in the city of Constantinople. Over the next century, Venice became the principal conduit through which trade goods moved from Constantinople to the West.

Venice, like other Italian cities, also experienced internal, often violent, political reform. The titles of the chief officials remained static, but the power shifted from hereditary autocrats to councils of elite citizens. As new families rose in economic prominence, they could sometimes manage to gain access to the centers of political power. Theoretically, the Serrata (Closing) of the Great Council of Venice in 1297 simultaneously brought one final group of families into the elite circles of Venetian governance while imposing a new order of social stratification.

For all three cities, religion—through public rituals, the cult of relics and saints, and other local practices—served as a glue to bind the commune, the community, and the rulers together in a common identity.

But success created conflict. In the twelfth century, Italians from all three cities participated in the crusades to the Holy Land. As a result, they were granted quarters in the Latin-ruled cities of the Levant and gained better access to the east-west luxury trade. In the late twelfth century up to 1194, Genoa and Pisa aided the Hohenstaufens in the conquest of Sicily but fell into war with each other over division of the spoils. Genoa won that round and claimed valuable positions in Sicily (as Pisa went into relative decline when this defeat coupled with the silting up of the Pisan harbor, a more permanent blow) only to witness Venice make equally great strides. Venice took advantage of the conquest of Constantinople in 1204 as a result of the Fourth Crusade. The Venetians conquered Crete, various islands of the Aegean and Adriatic seas, and expanded Constantinople's Venetian quarter throughout most of the breadth of the harbor of the Golden Horn. But Venice was not able to keep Genoa out of the Black Sea. The Genoese allied with Byzantine exiles, helped those exiles retake Constantinople in 1261, and tried to exclude the Venetians. Over the next two centuries, Genoa and Venice fought over Byzantium, drew Byzantium unprofitably into their conflicts, and made dominance over Byzantine trade their most important goal. Each city had large overseas holdings as well as colonies throughout the eastern Mediterranean and the Black Sea, and thus the battles between these two cities affected many different peoples and polities. One such Genoese holding,

the city of Caffa in the Crimea, seems to have been the point of access for the Black Death into Europe. Genoese sailors from that city may have brought the plague to Genoa in 1348. From there, it spread throughout Italy and into most of the rest of Western and Eastern Europe. Throughout the Late Middle Ages, Venice and Genoa, their colonies, and their allies would fight war after war, send privateers after each other's merchants, and generally undermine regional economic and political stability.

One must not, however, think of these three cities as particularly unique in medieval Italian history. True, they were the three most vibrant maritime republics of Italy. Venice maintained its dominance over the Adriatic and much of the Aegean for centuries. Each city developed particular and important traditions of art, architecture, and literature. Although on a lesser scale, the same could be said of many of the medieval Italian city-states. Before any of the three cities had become economically mighty, Amalfi and Bari had built vibrant economies based on widespread Mediterranean trade. Siena and Florence, two inland commercial-industrial cities, came to dominate their respective regions of Italy in the later Middle Ages, rivaled only by Venice and Rome as sites of Renaissance political power and artistic patronage. The rise and fall of the communes and the power of clan affiliations in urban political cultures are common threads not just in the three cities but throughout medieval urban history (and not just in Italy). Genoa, Venice, and Pisa offer many examples of important trends but should not be considered anomalies.

Finally, it is no coincidence that many early Atlantic explorers and the cartographers who recorded the changing world came from Italy, particularly Genoa. Italians had introduced the wealth of the East to Europe through overland trade and exploration. Marco Polo and other Italian merchants who voyaged to Central and East Asia provided inspirational stories of voyages to foreign lands. Francesco Pegolotti, the author of *The Practice of Commerce* of circa 1340, and other writers of merchant manuals produced concrete guides for foreign trade. In Pegolotti's case, his manual provided a step-by-step description of how an Italian merchant might travel over land all the way to Cathay (northern China)

in some relative comfort and safety and make a handsome profit for his troubles.

When the demise of the crusader states, the collapse of Byzantium, the collapse of the so-called Mongol Peace, and the expansion of Ottoman, Timurid, and Mamluk hegemonies rendered the eastern Mediterranean and western Asia less hospitable to Latin merchants, the economics of scale were transformed. The lost Vivaldi brothers of Genoa (who sailed away to "the Indies" by way of Africa in 1291, never to be heard from again) and the Genoese navigator Christopher Columbus (who never found the Indies but never admitted it) are evidence of the decline of the Italian merchant empires in the Mediterranean and the rise of the Atlantic world.

Economic Activity in the Early Ottoman Empire

Thirteenth-century Anatolia was in serious economic crisis due to certain sociopolitical factors. Although the Seljuks had endeavored to create a vigorous economic atmosphere through massive state spending, such as constructing large social and civic buildings, including strategically placed caravansaries, and establishing various markets, they failed politically toward the end of their era.

► TIMAR SYSTEM

Timar is a special term for nonhereditary, largely agrarian sources of income to maintain a cavalry army and a military hierarchy in the central provinces of the Ottoman empire, especially in Anatolia and the Balkans during the fourteenth through sixteenth centuries. The basic duty of the grantee was to protect the rights of each individual in the lands placed under his control and to join the imperial army whenever called, although duties varied to a certain extent depending on the size of the timar.

If a timar grantee failed to participate in a campaign when called, he would be dismissed. Theoretically, grantees also lost their timars if they committed a grave crime or implemented oppressive policies against the people under their protection. The characteristic that differentiated the Ottoman timar system from the European feudal system was the timar system's nonhereditary aspect, although Ottoman law recognized the right of a son to a certain part of the timar of a deceased father during the early Ottoman period.

The Ottomans sometimes used different forms of the timar system in conquered lands with respect to their policies of fostering reconciliation and contentment and gaining the goodwill of non-Muslims. For instance, the Ottomans kept many former Christian *pronoia*-holders in their place and recognized them as timar grantees. Being Muslim or converting to Islam was not a prerequisite for a timar. Indeed, in some regions half of the timariots were Christian, especially in the Balkans during the fifteenth century.

—Seyfi Kenan

Worsening the situation further were the Roman pope's decrees prohibiting Catholic Christians in Latin Europe to trade with Muslims. Although many Europeans failed to heed this prohibition, it had an effect, and western European trade with Muslims in Anatolia and other regions in the Middle East was reduced significantly as Europeans increased local production to supply their domestic markets' needs. This situation becomes clearer if one considers the low value of the first silver Ottoman coin that was minted in the early fourteenth century. A second piece of evidence is the low price of goods and services

in Anatolia, as Ibn Battuta, the prominent fourteenth-century traveler, observed. A third clue is the fact that young men were rushing to join the Ottoman regiment of foot soldiers in the same period due to the shortage of job opportunities in the region.

The decline of the regional economy, however, was periodic, and western Anatolia's economy rebounded in the fourteenth century due to the policies of various Turkish principalities. The Turcoman states of western Anatolia, especially the Menteşe and Aydın principalities, which emerged after the collapse of the Seljuk dynasty, concluded important trade agreements with various Italian mercantile states. While these Turkoman states were exporting wheat, cotton, carpets, dried fruits, horses, oxen, sheep, wax, and other similar items, they were importing wine, soap, and textiles.

The fourteenth century was also the era of Ottoman expansion, especially westward. As they expanded, the Ottomans endeavored to attract merchants and artisans, whom they considered to be indispensable agents for developing their new metropolises, by granting them tax exemptions and immunities. Consequently, the Ottomans eventually managed to turn Bursa, Edirne (Adrianople), and Constantinople into major commercial and industrial centers of the empire, as they became successive Ottoman capitals (1326–1402, 1402–1453, and 1453 onward). Upon their conquest of Constantinople, for example, they endeavored through both peaceful and forceful means to repopulate the neglected city with Turkish, Greek, Armenian, and Jewish migrant communities. Further, in order to rejuvenate the city's economy, Sultan Mehmed II established several commercial centers, including the Grand Bazaar, a huge covered area that still functions today and encompasses more than 58 streets in the heart of the city. Similar policies were implemented in other cities as Mehmed was transforming the state into an empire. Istanbul and Bursa became the major commercial centers for commodities that passed between the Middle East and Europe, while the local silk industry of Bursa supplied brocades and other silk fabrics to local and international markets.

In addition to the east-west trade route in the Mediterranean passing from the Middle East

to Venice or Genoa, a south-north international trade route evolved beginning in the early fifteenth century and ran from Damascus in Syria through Bursa in Anatolia and Akkerman on the Black Sea (present-day Bilhorod-Dnistrovsky) to Lviv in Poland and beyond. Three of its focal points became part of an expanding Ottoman empire: Bursa in 1326, Lviv in 1484, and Damascus in 1516. Oriental goods from near and far, such as spices, silks, and cotton, made their way by this route to the Baltic countries and Muscovy. Hungary and Slovakia also obtained their goods through this south-north trade by way of various Danubian ports and Braşov in Transylvania.

Many historians have concluded that credit was always poorly available in the Ottoman empire because of a religious prohibition regarding the charging of interest, and therefore its markets permanently suffered from a shortage of precious bullion and coinage. Such shortages, however, were not a permanent feature of Ottoman economic life. Beginning in the early fifteenth century, the empire enjoyed significant economic wealth and abundance until the eighteenth century, although the Ottomans went through certain periodic shortages of specie. The use of money in both urban and rural settings was widespread, as the empire's people participated in its markets through a wide variety of economic activities. Moreover, as the Ottoman army expanded into new territories from the early fourteenth century to the late sixteenth century, people from the rural areas of Anatolia as well as nomads began to settle in these newly conquered lands, acquiring *timars*, a source of revenue granted by sultanic diploma in return for regular military service. These settlements and sources of income contributed significantly to the development of a wide range of economic activities.

Following Byzantine precedents, the Ottomans initially sought to regulate economic activities, but they became cognizant of the limitations of state interventionism. After the fifteenth century they understood how hard it was to enforce price ceilings because such regulation was not in accord with underlying market realities. For this reason, they intervened selectively, implementing interventionist policies only when they encountered extraordinary conditions, such as

➤ OTTOMAN BURSA—MORE THAN JUST A POLITICAL CAPITAL

After the Ottoman conquest of the city in 1326, Bursa (Greek: Prusa) became the first Ottoman capital city and, just as important, a center of trade between the Ottoman dominions, Syria, and Egypt. As such, it affected commerce throughout the Levant. Ottoman registers of the late fifteenth century show that a diverse body of merchants (Levantine, Italian, Indian, Arab, and Byzantines from Muslim, Christian, and Jewish backgrounds) frequented the city to trade in wax, textiles, silk, cotton, spices, and dyes. The tax revenue generated from the spice trade was significant. In 1478 the duties from imported saffron, gum lac, and spice in Bursa amounted to 100,000 *akça* (over 200 Venetian gold ducats). This had been even higher earlier (135,000 *akça*). In 1500, Bursa custom records show that the merchant Abu Bakr of Aleppo sold spices worth 200,000 *akça* (over 4,000 gold ducats) in merely one transaction.

Spices were sent by ship and then caravans from India to Mecca or Egypt and from there to Syria and across Anatolia to Bursa. Spices were transported to the Balkans and then from the ports of the Black Sea and the Danube River to Moldavia, Poland, and Russia. The land route from Aleppo to Bursa followed roughly the ancient diagonal route across Anatolia. When B. de La Broquiere joined in 1432 a caravan of pilgrims and merchants coming from Mecca with 3,000 camels, the caravan took 50 days from Damascus to Bursa. At Akşehir de La Broquiere came across 25 Arab merchants in a caravansary and in Bursa met Genoese and Florentine merchants. The Florentine Benedetto Dei noted that Venetians bought spices with silver and gold currency, while the Florentines were allowed to barter spices for textiles. In the century after the conquest, Bursa's silk industry's main function was reexporting and processing Persian raw silk imported from Iran's Gilan region. The silk industry was organized as a system of guilds, and slaves constituted a substantial portion of the total labor force in the fifteenth century.

—Hayrettin Yucesoy

war, exceptional difficulties in provisioning the cities, or periods of financial instability.

It should be emphasized that the underlying principles of Ottoman economic policies from the beginning until the end of the eighteenth century were essentially based on three principles. The first principle was provisionism; that is, production within the empire was not geared toward export but rather toward providing ample goods and services for the internal market so that prices would be affordable for everyone. The second was fiscalism, the idea that the purpose of all economic activity was to maximize treasury revenue as much as it was possible. And the third principle was traditionalism, which means that once the Ottoman economic model, along with its institutions, completed its evolution by the middle of sixteenth century, it became a classical tradition that eventually turned into a principle to be sustained.

Mediterranean Sugar Production

The Muslim conquest of a large portion of the Mediterranean coasts by the early eighth century led to the introduction of sugar into the region. The Arabs had learned of sugarcane from civilizations to the east and spread it from Syria to Spain. Production required considerable capital investment as well as technological expertise. Sugar, however, gradually assumed an important role in the commerce of the Mediterranean, and its use spread into northern Europe. The techniques used in the Mediterranean for sugar production were later adopted for European plantations and refineries off the west coast of Africa and in the Americas, which quickly replaced the Mediterranean centers of production.

Arab conquerors probably first imported sugarcane from Iran and began cultivation in Lebanon and Syria during the eighth century. Sugarcane requires warm sunny weather with abundant water. Because Mediterranean weather includes lengthy dry seasons, Arab agriculturists developed extensive irrigation systems for the cane. The water requirements along with the need for large amounts of fuel to refine the sugar limited its production by Muslim growers to the Levant, the Nile Delta, parts of southern Morocco, the southern coast of Spain, and northern Sicily. Latin European attempts at sugarcane cultivation in southern France and Italy were unsuccessful. Mature sugarcane requires 12 to 14 months of growth, but most Mediterranean sugarcane was harvested after less than a year due to environmental factors, which meant that the sugar content was less than ideal. Realizing this, Muslim medieval writers noted how different manures could raise the sugar content to some extent.

At harvest, sugarcane was cut into small sections and crushed by large stone millwheels.

These were usually operated by oxen or human power, but some water mills were used during the fourteenth and fifteenth centuries. The cane was then pressed to extract as much juice as possible. The juice was boiled in cauldrons to reduce it to a thick syrup. Lack of wood for fuel helped limit where sugar could be produced. The syrup was placed in earthenware cones placed over jars. Fine holes in the bottom allowed molasses to drip out, leaving sugar crystals. The molasses was reboiled to produce more sugar crystals. When no more crystals could be produced, the remaining molasses would be used locally. The best sugar was produced by boiling the crystals a second or third time. The sugar was graded according to its color and whether it was fully crystallized or in loaves.

The large investment required to refine sugar meant that production was in the hands of the wealthy. In most Muslim societies, large landowners parceled out the fields to peasant sharecroppers, who turned a varying proportion of the harvest over to the landowners. In Egypt, serfs cultivated sugarcane on state-owned land granted to Mamluk military officers.

Although sugar was produced and traded among Muslims since the eighth century, it was an exotic food to Latin Christian Europe. The Norman French who conquered Sicily in the course of the eleventh century were the first Latin Christians to have access to sugar on a regular basis. As significant as this was, it paled in comparison with the impact of the crusades on Latin Europe's taste for and access to sugar. The key was the establishment of Latin crusader states in the Levant. Not only were they conduits for the transportation of sugar from Muslim lands, but several of them became centers of sugar production. During the twelfth and thirteenth centuries, Western colonists turned over large tracts of land to sugar production in those regions of the crusader states in Syria-Palestine that had sufficient water to grow the thirsty cane. This included the coastal region of present-day Lebanon and Israel and the Jordan Valley. There was a security problem, however, given that this land was contested between various Muslim and Latin Christian forces. When Acre, the last significant crusader bastion on the continent, fell in 1291, primacy in sugar production, as far as the West

➤ SLAVE LABOR PLANTATIONS OF CYPRUS

A declining population on Cyprus led to greater reliance during the fourteenth century on imported slave labor. Inasmuch as slavery at this time had no particular ethnic or racial basis, these slaves represented many ethnic groups, including Greeks, Bulgarians, Turks, and Tatars. Muslim slaves who had sugar-production experience were especially prized and were often obtained as captives taken by crusaders or pirates. As a result of their skills, they were generally well treated, whereas the heavy and dangerous work in the fields and production centers fell to the large majority of unskilled slaves.

—*Timothy J. Watts*

was concerned, passed to the Latin-held islands of Cyprus and Crete on which Western colonists had been producing sugar since the early thirteenth century. Of the two, Cyprus became the West's major source for sugar during the fourteenth century, and sugar became an increasingly important part of its agricultural productivity during the fourteenth and fifteenth centuries.

Sugar production on the two islands centered mainly on large plantations, where the cane was both grown and processed. The great sugar-producing landowners included the Frankish Lusignan kings of Cyprus; wealthy Italian families, such as the Cornaro clan; and religious orders, including the Knights of St. John (the Hospitalers). Unlike the sugarcane farms of Syria-Palestine, where Latin landlords, following the age-old traditions of the region, had depended largely on free sharecropper peasants, the sugar producers of Crete and Cyprus depended on slave labor due to a lack of sufficient free labor. But this was not unprecedented. Muslim growers had previously turned to slave labor on plantations in Iraq centuries before, which had occasioned the great ninth-century Zanj Revolt among the East African slaves working on these plantations.

By the mid-fourteenth century, production in Mamluk-dominated Syria-Palestine and Egypt began falling. One reason appears to be rural depopulation because of the Great Eurasian Pandemic known in the West as the Black Death.

When cities saw their populations fall by about 50 percent, wages naturally rose, and many peasants left the countryside for the cities, attracted by these higher wages. Wars, particularly the Mongol invasions of Syria in the thirteenth and fourteenth centuries, also disrupted production. Consequently, the complicated irrigation systems needed by sugarcane fell into disrepair. Conversely, the Latin Christian centers of Crete and Cyprus increased their production after 1300. Even so, production on Cyprus by 1500 was less than 700 tons of sugar annually.

By 1500, Mediterranean sugar faced stiff competition from Atlantic islands recently colonized by Europeans. Sugar grown on Madeira arrived in Europe soon after 1450 followed by that produced on other Portuguese islands off the coast of Africa, such as São Thomé. Due likewise to the scarcity of available local labor on these Atlantic islands, the Cretan-Cypriote model of slave-labor plantations was employed. Farther west, sugar production was established in Brazil in the early 1500s. Thanks to the climate of this region of South America, Brazilian sugarcane had a higher sugar content than anything produced in the Mediterranean. This meant that despite the high cost of transportation, sugar from the New World could undersell any produced in Crete or Cyprus. The abundance of wood for fuel and the lack of irrigation requirements opened markets for American sugar in Constantinople and Sicily. When Brazil came under Spanish control in 1580, new markets for Brazilian sugar became available throughout Europe.

Although eventually destroyed by the American sugar production, the Mediterranean sugar producers established a pattern followed in the New World. The technology remained virtually unchanged for years, and the slave-based plantation system created on Cyprus and Crete to produce sugar was the pattern used by Portuguese producers in Brazil and later by other Europeans throughout the Caribbean.

Mediterranean Silk Production

Fabrics and clothing made of silk were the most desirable in the Mediterranean region during the European Middle Ages. They were worn by royalty and as ritual garments by the high clergy, and silk cloths decorated churches as well. Because of the great demand, silk commanded high prices, leading rulers throughout the Mediterranean region to encourage its production. In this same period, silk production became one of the economic foundations of the cities of northern Italy.

Silk production originated thousands of years previously, probably in the Yellow River (Huang He) valley of China. Despite attempts to restrict knowledge of production methods, the secrets of silk production had traveled as far west as the Eastern Roman (Byzantine) empire of Justinian I by the mid-sixth century. Byzantine silk production was a state monopoly, and production centers were established in Constantinople and Syria. Muslim conquest of Syria-Palestine in the seventh century brought the secrets of silk production into a fast-expanding Muslim world. Silk production was introduced into Spain after its conquest in the early eighth century. Sicily also became a center of silk production under both Muslim and Norman rulers. When Byzantium initially lost Syria to the Muslims, many silk makers from the region relocated to Thebes and Corinth. Trade in silk clothing and fabrics remained strong throughout this period even between Arabs and Christians, with many Jewish merchants serving as intermediaries.

The crusades helped make more Europeans aware of luxuries available from the East. Goods such as spices, sugar, and silk all made their way to markets throughout Europe, where demand for them increased greatly. Demand increased

trade, which increased the power and wealth of some Italian cities. These cities had already benefited from their role as middlemen in trade between different parts of the Mediterranean world, and the increased traffic made their merchant classes more powerful. Some Italian cities, especially Lucca and Bologna, developed silk industries by importing raw silk from Sicily. The silk was woven into fabrics and clothing and then exported to markets throughout Europe and the Mediterranean. By the fourteenth century, Italian merchants had established groves of white mulberry trees in the peninsula and were producing their own silkworms. The lower costs of silk production then allowed the Italians to undercut the prices of their Muslim competitors.

Weavers learned to produce different qualities of silk fabrics. The heaviest-weight silks were in greatest demand and were the most expensive. Medium- and lighter-weight silk fabrics were less expensive since they required less raw material. For many ceremonial garments and fabrics, other materials were interwoven with silk threads. Gold and silver in particular were drawn into long, thin, and flexible threads and combined with colored silk to create fabrics used by the highest classes of government and the Church.

At first, silk production in Italy used traditional labor-intensive methods that had been practiced in other regions for thousands of years. The demand for silk products and the effort to produce more at lower costs, however, led to some early applications of mechanical devices. In Bologna, a silk production center became one of the first large-scale factories using nonanimal power. In 1272, a silk-throwing machine was installed, which used water power and produced yarn. Several hundred workers were replaced by two to four operators. Another invention from the thirteenth century was the introduction of the Eastern drawloom. Early versions originated in Sassanian Persia, but it was perfected in Italy. Boards holding intricate designs were placed over the looms. When the weaver wanted to insert the design into the cloth, he or his assistants used pulleys to open leashes suspended from the boards, allowing the loom's shuttle to pass through. Later developments of this concept included the jacquard loom of the nineteenth cen-

➤ BOLOGNA'S SILK-THROWING MACHINE

The innovative silk-throwing machine, first developed in Bologna in 1272 and powered with an undershot waterwheel, allowed three to four operators to do the work of several hundred craftsmen. The machine took silk filaments and twisted them together to create yarn. It had two concentric circular parts, measuring about 16 feet (5 meters) across. The inner part of the machine turned, thanks to the waterwheel. The outer section was stationary, with various reels and spindles that turned, thanks to the inner portion. Bobbins with the silk filaments were rotated, with the filaments being fed into reels located above them. Multiple filaments were twisted onto the same reel to produce strong threads of yarn. The skeins of yarn were then taken and boiled to remove the sticky sericin gums that held the filament together. After rinsing and drying, the skeins were bleached and later dyed. The density of the twists determined the quality of the yarn and the textile it produced. The development of the silk-throwing machine helped the Italian cities to be Europe's silk-producing centers for nearly 400 years.

—*Timothy J. Watts*

tury and machines controlled by punched cards, including early mainframe computers.

From the beginning of the twelfth century through the end of the fifteenth century, Italian cities dominated the silk trade in the Mediterranean. Venice, Genoa, and Florence as well as Lucca and Bologna became important silk centers. The Norman rulers of Sicily also tried to establish a strong silk industry after they captured that island from its Muslim rulers. In 1147, Norman armies sacked Thebes and Corinth, centers of the Byzantine silk production. The artisans who produced the silk were deported to make high-class silk in Palermo, the Norman capital. The capture of Constantinople in 1204 by crusaders also resulted in a broadening of silk production. Many skilled workers were relocated to Venice, jump-starting the Venetian silk industry.

Italian silk production remained unrivaled in Europe until the sixteenth century, when

production in southern France assumed an artistic and technical lead.

Shipbuilding

The period between 1000 and 1500 CE witnessed a rebirth of shipbuilding in the European portions of the Mediterranean. Early in this era, European shipwrights continued to use many of the techniques of Antiquity. The crusades and the increased demand for trade, however, spurred construction and innovations in construction and financing. Innovations from Byzantine and Muslim sources were adopted by the Europeans. Financial dealings with eastern Mediterranean societies helped change how shipbuilding was organized and financed. By the close of the period, elements of ship design from northern Europe had melded with Mediterranean styles to create handy ships that were suited to European worldwide exploration voyages, far beyond the confines of the Mediterranean.

The end of the Roman empire brought an end to the trade routes across the Mediterranean. In the West in particular, shipping became localized and was largely restricted to small coastal vessels of 100 tons displacement or less. The breakdown in centralized authority also led to a rise in piracy and a decline in commercial operations. Merchants in the Byzantine areas continued to move goods by water but over shorter distances.

During the tenth century, waterborne trade in the Mediterranean increased, leading to increased shipbuilding as well as an increase in the size of the ships. Innovations such as the replacement of clay jars (*amphora*) by barrels allowed ships to carry more cargo for their size as well. These ships had sailing characteristics

that were improvements over their larger Roman predecessors.

The Byzantine, Muslim, and Western shipbuilders learned from each other, observing ships produced in other parts of the Mediterranean. Byzantine shipbuilders preserved and developed Roman techniques. When the Muslims conquered Egypt and North Africa, they assumed control over the shipbuilding facilities from Byzantine authorities. They also introduced innovations and new types of shipping from Muslim areas on the Indian Ocean. For example, most Muslim ships were constructed frame-first, with planking added after the ribs were in place. Western and Byzantine shipwrights adopted this technique as well. They also abandoned the labor-intensive mortise-and-tenon technique used by the Romans since it required much time and skill and was correspondingly expensive.

During the eleventh century, trade between different Mediterranean regions increased. Improved ships made it possible for merchants to pursue a triangular trade. Generally speaking, merchants carried agricultural products and raw materials from Western Europe to Tunisian and Egyptian ports. In exchange, they received gold, spices, and oils, which they took to Byzantine ports. Byzantine products included jewels, ceremonial clothing, and other luxury products produced by Byzantine craftsmen. Trade between the regions continued despite periodic wars and religious differences. Jews were often involved in the trade, serving as middlemen between Muslims and Christians.

During the early portion of this period, ship captains usually built and owned their own ships. Crews were recruited for a share of the profits. By the twelfth century, the growing demand for ships to carry the increasing trade changed the patterns of ownership. More commonly, groups of investors, usually merchants, formed partnerships to build ships. The partnerships then hired captains and crews for trading voyages. Increasingly, government subsidies helped pay for the construction of large ships that could be pressed into service as warships in time of troubles.

Ship types could generally be divided into round ships, whose width was only two or three times their length, and galleys, which were narrower and used oars as their primary source of

movement. Round ships were primarily cargo vessels and were powered by sails. During the thirteenth century, shipbuilders in Italy began to build great galleys. These ships were wider and larger than the normal galleys and could be powered by both sails and oars. The great galleys were able to carry considerable amounts of cargo while still maintaining the higher speed of galleys. They were used especially to carry valuable cargo, including wealthy passengers.

Great galleys were among those ships whose construction was subsidized and overseen by the various Mediterranean governments, since they were very useful in warfare. Muslim port authorities were among the first, since Muslim law required that all ships be inspected and certified before they could sail. The officials who carried out the inspection were known as *urafa al-sinaa*, from which the word “arsenal” comes. In the West, the most famous example of this collaboration between public and private authorities was the Arsenal at Venice. The Arsenal was a publicly funded and maintained shipyard, based upon similar institutions in Byzantium. The shipyard’s employees built and maintained privately owned vessels, which were then available for military service during wartime. By ensuring the quality of materials and skilled labor, the Venetian government helped private businessmen to prosper, adding to the city’s revenues.

Increasing corporate ownership and changing management methods encouraged new technologies that would increase profits. Crude compasses consisting of magnetized needles in bowls of water were introduced during the late twelfth century. Cotton sails replaced linen ones, since they dried more quickly and sagged less. New ship designs gradually replaced traditional ones when they promised greater efficiency and profits. Design features of the cog, a type of ship common in northern Europe, appeared in Mediterranean ships toward the end of the period. The cog’s high castles at the front and rear of the ship made it more easily defended, and the cog’s square sail was combined with the Mediterranean triangular lateen sail for greater efficiency. A sternpost-mounted rudder replaced the Mediterranean steering oar. The resulting ship was known as a carrack. With the carrack, a separate Mediterranean style of shipbuilding came to an

➤ AIGUES MORTES, A ROYAL NAVAL ARSENAL

Aigues Mortes (Dead Waters) was a military arsenal and port on the Mediterranean coast of France established by King Louis IX (Saint Louis) in 1241. Its name came from the brackish lagoons located between the city and the Mediterranean. Louis’s engineers cut canals through the spits of land that divided the lagoons from the sea. The passages often had to be dredged because they filled with silt. An outer harbor provided anchorage for larger vessels.

Aigues Mortes, which had recently become part of French royal lands, was chosen as the site for a royal port because all the existing ports along the southern coast of France belonged to other states. Marseilles, for example, was under the control of the German emperor. Ports to the west were controlled by the king of Aragon.

Louis was determined to lead a crusade to the Holy Land. Since his army and supplies would go by sea, he needed to establish a port under royal control. To attract settlers to this marshy and unhealthy area, Louis granted exemption from most taxes. Thanks to Louis’s huge expenditures in preparing for his crusade, nearly 15,000 people had settled in Aigues Mortes by the end of the thirteenth century. Besides serving a military purpose, Aigues Mortes was an entry port for trade from the east.

Because Louis’s subjects had limited experience and capabilities for building large ships, he depended largely on Genoese experts. The shipbuilding facilities at Aigues Mortes were built by the Genoese, and the admirals who commanded the fleet on the crusade were also Genoese. Most ships that transported Louis’s army were built by the Italians. Later, a limited number of French ships were built at Aigues Mortes, but the facilities were always inferior to those of Marseilles.

Louis left on the unsuccessful Seventh Crusade from Aigues Mortes in August 1248. His forces included a reputed 1,500 ships and 35,000 men. Although defeated, he was determined to try again. On July 2, 1270, Louis sailed from Aigues Mortes to Tunis on the Eighth Crusade, only to die less than eight weeks later.

■ Introduction: The Indian Ocean—Market Place of Afro-Eurasia

The Indian Ocean was the market place without peer for Afro-Eurasia, attracting merchants from the Far East, East Africa, the Mediterranean, and even the farther reaches of Western Europe to its bazaars and emporia. And of all of the centers for commerce, the two coasts of India, which dominated the core of the world of the Indian Ocean, drew the most traffic. India was not only the producer of a wide variety of valuable trade items, it was also a center for the trans-shipment of goods traveling from east to west and west to east. During the later thirteenth and early fourteenth centuries, the Yuan emperors of China deliberately promoted a heavy volume of maritime trade between southern China and both coasts of India. A world map of 1375, known as the *Catalan World Atlas*, which was produced on the Aragonese-controlled island of Majorca in the western Mediterranean, depicts a large, multi-masted Chinese junk lying off the Malabar Coast, and nearby pearl divers are gathering these precious trade gems.

Some of the most revealing evidence for the volume and complexity of export-import commerce in India comes from documents recovered from the Cairo Geniza. A *geniza* is a chamber attached to a synagogue and set aside for the pious storage of any form of discarded writing in which a reference to God was made or implied. A significant number of these geniza texts date to the eleventh through thirteenth centuries and reveal the activities of an Arabic-speaking Jewish community of “India traders,” who resided in Fustat. Fustat was the commercial center of

Egypt, which was located about 2.5 miles (4 kilometers) south of Cairo.

Commerce with India and other locales throughout the Indian Ocean was intimately connected with Mediterranean trade. It has been estimated that more than 50 percent of all commodities traded in the Mediterranean between 1000 and 1300 CE came directly from or through lands washed by the waters of the Indian Ocean. This substantial volume of goods included, of course, items from China and other regions of the Far East.

The Jewish merchants of Fustat were not the only Western traders in the Indian Ocean, but they were a significant presence there. Their travels took them overland to the Red Sea, through which they sailed to their mid-way point, Aden, on the southern tip of the Arabian Peninsula, where a substantial community of Jewish merchants resided.

Aden, cut off by mountains from the farmlands of the southern peninsula, was supplied with food by ships and existed solely because of its strategic location along the shipping lanes of the Indian Ocean. At least it had its own water supply, which was not the case with the port of Hormuz at the southern end of the Persian Gulf. Even Hormuz’s water came to it by ship. If ever commerce created two important port cities that should not have otherwise existed, they were medieval Aden and Hormuz.

From Aden, the Jewish-Egyptian merchants picked up the south-westerly monsoon, or trade, winds that brought them to their Indian ports of call. These were usually the cities of the west

coast, but the Fustat Jewish traders were also known to circumnavigate the peninsula and carry on business along India's east coast. If luck held out and their business was concluded in a timely fashion, the merchants returned home the following year, driven by north-easterly trade winds. At a minimum, the merchant was absent from home for two years but, more often than not, circumstances prolonged that absence. In a letter written around 1204 to his wife (which might never have been sent because of its frankness), a merchant named Solomon, who had traveled all the way to Southeast Asia, notes that he has been away so long his wife is importuning him for a divorce, but he begs her to reconsider, lest she "lose these long years of waiting." Because the letter was deposited in the geniza, at least one scholar has concluded that he finally arrived home safely and was reunited with his wife. One hopes so.

Evidence from the letters, contracts, shipping bills, accounts, and court records found at the geniza provides a detailed picture of the items exchanged in this Mediterranean-Indian Ocean commerce. Chief among the goods carried both ways were textiles. In fact, Spanish silk from al-Andalus was at times used by the Jewish merchants, instead of golden Egyptian dinars, to pay for goods and other expenses, including labor, incurred in their travels. It was even used for this purpose in India, despite the fact that India had produced silk for centuries. Because textiles, including Indian and Egyptian cottons, were such an important item of exchange, dyes were likewise prime commodities. Lac, a scarlet, resinous insect secretion from China, was highly valued, and indigo, grown in both the eastern Mediterranean and India, traveled both ways. Even though China had its own cinnabar, a toxic mineral that produces a bright red (vermilion) color, Spanish cinnabar was highly prized in the eastern reaches of the Indian Ocean. Fragrant woods from Asian forests went west, while various metals, especially copper and its alloys, as well as Sudanese gold and Spanish silver, traveled east.

If one wishes to speak of a trade imbalance, it was the West that sent a disproportionate amount of precious specie, silver and gold, in return for goods. Aromatics, incenses, precious

gems, especially pearls, as well as cheap ornaments, were popular, easily carried items of trade, and largely moved from east to west. At the same time, the finely crafted jewelry and vessels made by Mediterranean gold- and silversmiths were avidly sought after in the Indian Ocean. Pharmaceuticals traveled both ways. Scammony, a powerful purgative from the eastern Mediterranean, was brought into the Indian Ocean, but in return a wide variety of *ayurvedic* (the science of life) *medicamenta* from India made their way west, including camphor and celandine, a herb of the poppy family from which a tonic was made. Sweet-smelling thyme and honey and much-prized olive oil from the eastern Mediterranean were more than offset by the spices of the Indian Ocean, including Indian pepper and cardamom, cinnamon from Ceylon (present-day Sri Lanka), and cloves and nutmeg from the spice islands of Southeast Asia (present-day Indonesia).

Manufactured metal ware from the workshops of Egypt and Syria was brought east for trade, but also damaged metal vessels and utensils were transported to India, where they were expertly repaired at prices that justified their transportation. Bronze ware went both ways, especially the highly-prized cast bronzes produced in southern India. One wonders, however, if these pious Jewish merchants (and the equally pious Muslim merchants with whom they interacted) ever handled the exquisite Chola bronzes of Hindu and Buddhist deities. I know of no evidence to suggest they did.

Despite this lamentable lack of evidence regarding Chola bronzes (and an absence of evidence is not evidence of an absence), it is no exaggeration to say that records show that there was a high level of interchange of commodities of almost every sort between the Mediterranean and the Indian Ocean in the years preceding the voyages of da Gama into these waters.

—Alfred J. Andrea

Everyone Meets in Malacca— The Pivotal Place of Malacca in the Indian Ocean

In the fifteenth century the port city of Malacca came to dominate trade in the Indian Ocean. Controlling the strategic waterways between

➤ TRADE AND STATE BUILDING GO HAND IN HAND

Malacca combined rapid growth as a port with the consolidation of state power. This rise was helped by the protection provided by China. Beginning in 1405, the Ming emperor sent out massive fleets into the Indian Ocean region to trade, gather intelligence, and project Chinese power. Contacts were established with local merchants, and pirate nests were destroyed. Admiral Zheng He offered security to Malacca in the form of a tributary relationship with China. In 1431 the voyages were stopped, but by then this arrangement had secured Malacca from Javanese and Thai attacks. The rulers of Malacca also converted to Islam, an act that encouraged commerce and bolstered state power. The sultan of Malacca ruled as an Islamic ruler with the assistance of officials responsible for military, commercial, and diplomatic affairs. A great deal of emphasis was placed on court ceremonies, both to impress foreign guests and to legitimize the sultan's rule.

—Michael Wood

Sumatra and the Malay Peninsula, Malacca grew wealthy through trade networks linking China, India, and the Middle East. Malacca rose to prominence not through military victories but through providing facilities for international transactions in commodities and luxury goods. It was also a relatively open society, home to foreign visitors and long-term residents.

Malacca was founded in 1402 by Paramesvara, who had earlier tried to establish a trading center in the region but had been blocked by Thai forces and by the Java-based empire of Majapahit. But the power of Majapahit was in decline, and the increased Chinese interest in Southeast Asia allowed the city to flourish. Malacca was able to establish a close relationship with China while exploiting its strategic position and good harbor facilities. In addition, Paramesvara or possibly his son converted to Islam. By adopting Islamic titles, the rulers of Malacca gained prestige and were able to link up with Muslim trade networks spanning the Indian Ocean.

In subsequent decades Malacca developed into the premier port of the region. The city handled spices from the Moluccas, porcelain and

silk from China, textiles from India, and pepper, gold, resins, and animal skins from Sumatra. Malacca acted as a venue for foreign merchants to meet and for trade goods gathered from smaller local ports. Because of the monsoon winds, visitors often resided in Malacca for many months. Foreign merchants included Tamils, Javanese, Chinese, Arabs, Siamese, and especially Gujaratis. The port was run by officials known as *shabbandar*, who were usually drawn from these foreign communities. *Shabbandar* were entrusted to collect taxes, unload vessels, and ensure accuracy in weights and measures. A maritime code, combining Islamic law with indigenous concepts, provided detailed rules for all aspects of trade. Members of the local Malay elite were also involved in long-distance trade. Lower-end trade using smaller vessels met the city's basic needs; Malacca was dependent on Java and Siam for its rice. In the fifteenth century Malacca may have had a population of between 40,000 and 50,000.

By the start of the sixteenth century Malacca was thriving, drawing merchants from as far away as East Africa. In 1511 a Portuguese fleet captured Malacca and the local Malay elite fled. The Portuguese built a large stone fort and a separate residential area for themselves. However, attempts were made to keep the previous trade system intact. Foreign communities continued to govern their own affairs, and it was hoped that Indian merchants would be attracted to the city. Marriages between Portuguese and local people were encouraged, and little effort was made to impose Christianity. But Malacca went into economic decline at this time, as Muslim merchants preferred to operate out of Johor and Aceh. Malacca later passed to Dutch and then British control. But it remains a powerful symbol for modern independent Malaysia as a successful Muslim city-state that thrived through international trade.

The Spice of Life— The Trade in Spices

Spices are so commonplace now that it is difficult for the modern reader to imagine the economic role they once played. That wars have been fought over pepper, something that is now given away free in restaurants, and that imperial policy was shaped by nutmeg and cloves is difficult to fathom. Ancient Roman authors even fretted that the pepper that Rome imported from India was leaving the empire with a crippling trade deficit.

While there are many spices and herbs that are used to flavor the food of the world's various cuisines, there are four spices that are esteemed widely and cross-culturally: pepper, cloves, cinnamon, and nutmeg. Pepper was and still is the most widely consumed of all four. The other three, which are collectively known as the fine spices, have always been rarer and hence more expensive. Now when the fine spices are used by modern Western cooks, they usually appear in sweets, but between 1000 and 1500 they were widely used in savory dishes, such as meats, and to flavor wine and beer. They were also believed to have medicinal qualities in many parts of the world. Cloves were used as breath fresheners and for their oral anesthetic qualities. The cuisines of India, the Middle East, and China all made extensive use of pepper and the fine spices especially in the foods that were consumed by the elite. Thus, since long before 1000 there had been a spice trade.

All of the spices thrive in tropical places and refuse to grow in cold or dry places. Most of the people who ate these valuable foods lived far from where the spices grew, making spice one of the earliest goods to be traded over long distances. Most of the world's pepper, the dried seed of a viny plant, came from the southern tip of India. The best cinnamon, the bark of a shrubby tree, came from the island of Ceylon (present-day Sri Lanka). Cloves, the dried flower buds of a tree, came from the Moluccas Islands in what is now Indonesia, as did nutmeg, which is the stone of a tree fruit. Thus, all grew in fairly

restricted places that were distant from the markets where they were desired.

Within the Indian Ocean trading world pepper was widely traded and treated less as an exotic rarity and as more of an expensive staple. Unlike the fine spices, the production of which was restricted to islands and in the cases of nutmegs and cloves rather small islands, pepper was grown throughout southern India and thus was reasonably plentiful and in reasonable proximity to its markets. Ships calling at the pepper ports of Calicut, Cochin, and Mangalore in southern India carried large quantities of pepper to the Middle East and to China. The fine spices, in contrast, were valuable even within the Indian Ocean and were treated as luxury foods.

The spice trade had previously been responsible for bringing Indian influence, especially Hinduism and Buddhism, to the court culture of coastal Southeast Asia. During our period it was more often Islam that spread along the spice trade routes. The pepper ports of southern India had significant Muslim populations, some of whom were local converts, called *Mapillas*, as well as Arab merchants who became permanent residents. These pepper ports were also home to Jews, Armenians, and Persians who came there to pursue the spice trade. An interesting feature of these ports was the growth of mystical religious groups that appealed to both Hindus and Muslims. In Southeast Asia, Islam spread through the region during this period, gradually moving from the port cities into the countryside until by 1500 it was the dominant religion of insular Southeast Asia.

For Europeans, pepper remained a rare luxury. Pepper consumption was minimal in Europe before the twelfth century when the crusades brought large numbers of Europeans into contact with the spice-using cuisines of the Arab world. Once they realized what they had been missing, Europeans became enamored of pepper and the fine spices. It was, however, difficult for them to get access to the spice markets of the Indian Ocean. Their spice supply had to pass up the Red Sea to Egypt. The rulers of Egypt sold spice to only one group of Europeans, the Italian city-state of Venice. The Venetians sent an annual convoy to the Egyptian port of Alexandria, where they purchased as much spice as they could.

► NUTMEG—THE AMBROSIA OF INDONESIA

Nutmeg was the rarest and most expensive of the fine spices. Nutmegs are not actually nuts but the stone of a fleshy fruit. On the outside of this stone is a leathery membrane called mace. Mace tastes much like nutmeg but has a subtle and less assertive flavor. It is also more valuable than nutmeg. Compared with the other fine spices, which have strong flavors, nutmeg is rather mild and delicate in flavor. Most familiar to modern Americans as the dominant flavor in eggnog, nutmeg was once used to flavor a broader variety of foods than it is now. In North India the fragrant sauces served over meats were spiced with nutmeg. In Europe nutmeg became one of the spices in the classic French spice mixture called *quatre épices*. Nutmeg was used to flavor meats and to complement the flavor of vegetables, especially spinach. It was also a popular flavoring in beer and in wine. Grown almost exclusively on the diminutive island of Banda in the present-day nation of Indonesia, nutmeg crossed the trade routes of Eurasia, reaching the tables of epicures from Hangzhou in China to Delhi in India to Paris in Europe. It was a truly global food.

They then sold that spice to Europe at a very high price.

Long after pepper had become relatively commonplace in the food of Asians, the long chain of middlemen and monopolists who stood between Europe and the pepper fields of India kept pepper a dear commodity in Europe. The fifteenth century saw several efforts by European mariners to bypass those middlemen and sail directly to India. One of those voyages, that of Christopher Columbus in 1492, failed to find India but did find the Americas. The second voyage, that of Vasco da Gama in 1497–1498, made it to India and returned laden with a cargo of pepper. Thus, two of the most significant voyages in world history were triggered by European desire for cheaper pepper.

Indian Industries

Indian medieval industrial centers were of small scale except for a few royal workplaces set up by Muslim rulers, beginning around the mid-fourteenth century, to produce luxury products for palace use and as diplomatic gifts. Regardless of the modest size of most of its individual industrial enterprises, India at this time housed a wide

range of industries. Of these the textile industry was the most important, not only in scale but also in terms of export and early development. Indian fabrics were highly valued for their quality and decorative resist-dyed patterns.

The main centers of textile production were Bengal, Gujarat, the Deccan, Orissa, and the Coromandel Coast for cotton; Kashmir for cashmere wool; Varanasi, Gujarat, the Deccan, and Kanchipuram for brocades; and the Ganges Delta, Gujarat, and Varanasi for silk. Most export textiles went to either southern Arabia and Oman, which entirely depended on this trade for cloth, or Southeast Asia.

During this period the cotton industry produced three typical Indian fabrics that would have a great impact on later European fashion. Calico originated in Kozhikode on the Malabar Coast, and its modern name derives from Calicut, the British name for the city. It became popular in Europe in the seventeenth century in its block-printed flower-patterned variety known as chintz, often referred to as calico as well. Finely woven muslin, which was also introduced into Europe in the seventeenth century, probably originated in Dhaka in present-day Bangladesh.

The silk-weaving industry mainly used imported yarn from China. Silk from three indigenous silkworm species was used to a lesser extent. These nonmulberry silkworms produce a flatter filament than the conventional Chinese species. In addition, their cocoons are collected after the larvae have matured and chewed through the cocoon, resulting in cut and thus shorter fibers. Indigenous silks, such as tassar, were mainly produced in Bihar, West Bengal, Bangladesh, and Assam.

Indian brocades of this period displayed a wide range of patterns and appeared in various local styles. Brocades from Gujarat and the Deccan retained traditional decorative patterns known since the Gupta period, whereas those from Varanasi displayed a large variety of innovative patterns. Fabrics entirely made of silver or gold threads were rare and were for royal use only. Brocades were also made in great amounts at the royal workplaces.

The dye industry was closely related to the textile industry. Indigo was economically most important and had been exported as a luxury

product to the West since the Roman era. It was produced in large quantities in northern India, especially in Bengal. Gujarat housed the main lac industry, which produced a red dye, as well as shellac, derived from the lac, or secretions plus bodies, of a number of insect species. Other dyes were safflower, waras, Indian madder, turmeric, and jackfruit, as mentioned by the eleventh-century Sanskrit author Kshemendra. Four dye techniques were applied: wax-resist dyeing (*batik*), tie-dyeing of cloth (*bandhana*), tie-dyeing of the warp or weft yarns (*ikat*), and block printing. *Ikat* fabrics can be traced back to the late thirteenth century in Gujarat and Rajasthan and in the early fourteenth century to Orissa. Block-printed textiles and *batiks* were exported in bulk to Arabia and Egypt, and remains have been unearthed at twelfth-century and earlier Egyptian sites.

The nonprecious metal industries, distributed all over India, processed iron, wrought iron, steel, copper, brass, and bronze. The precious metal industries were mainly found at the capital cities of the various kingdoms. Noteworthy among the metal products is the legendary wootz steel, a crucible steel with a typical banded pattern containing trace amounts of tungsten or vanadium. It was the preferred steel to make swords and was exported to the Middle East and China. Wootz steel may have been the basis for the famous Damascus steel, but at present there is no consensus on this. The copper, brass, and bronze industries produced mainly household utensils, ornaments, jewelry, bells, and religious and devotional items. Tinned ware appeared only in the fifteenth century and was restricted to Kashmir and the northern Punjab. The gold and silver industries were much prized for their inlay and delicate work, especially the silver inlay work of Bidar in the Deccan, which was developed in the fourteenth century, became known as *bidriware*, and was a highly prized export item.

India's legendary gem industry figures in medieval travel accounts and fantastic stories, and the flourishing diamond industry of Golconda ranked first among all in terms of its products. The term "Golconda diamond" is still in vogue to describe very transparent, chemically pure natural diamonds. The diamonds were mined at

➤ GUJARAT—A CENTER OF MANUFACTURING AND COMMERCE

Thanks to its strategic position on India's northwestern coast, the region of Gujarat emerged as one of India's main centers for trade and commerce. The region was connected with the Silk Road via routes through northwestern India and Afghanistan as well as with the empires of the south via the Deccan plateau. Its extended coastline had harbored several important ports since the Bronze Age.

Al-Biruni (973–1048) describes the early trade from the port of Somnath with Zanzibar and China. Gujarat's maritime commerce grew especially after the thirteenth century due to a growing spice trade, a sound currency system, and massive expansion of European commerce. Gujarati merchants and agents were found in commercial ports on India's Malabar (southwestern) Coast, along the Persian Gulf and the Red Sea, and in East Africa. Marco Polo (ca. 1254–1324) mentions the multitude of ships and cargoes of the port of Khambhat and its regular exports to Arabia and Southeast Asia. Khambhat, a major port during the thirteenth through fifteenth centuries, silted up by the end of the fifteenth century, and main activities shifted to Surat.

The growing demands of both trade and the new elite class boosted artisanal activities. Gujarat housed various flourishing industries. The region became one of India's major textile producers and India's main exporter of textiles during the fourteenth and fifteenth centuries. Areas in south Arabia and Oman relied entirely on this trade for clothing, as observed by Ibn Battuta in 1341. Gujarati textiles were further exported in bulk to Egypt by Arab traders. Silk from Khambhat was much in demand, even though Gujarat did not produce silk but instead relied entirely on its importation of silk yarn.

In the fifteenth century, Gujarat's paper industry had become India's leading manufacturer. The glass industry of Kapadvanj manufactured bottles, scent sprinklers, and vases. In Khambhat a prosperous agate industry developed, producing decorative household objects, jewelry, beads, and leather burnishing tools for the Gujarati leather industry.

—Alexandra van der Geer

the Kollur mines of Andhra Pradesh, which yielded the world's then-largest diamond, the Koh-i-Nur, mined sometime before 1323. Other Indian precious stones were rubies and sapphires from Ratnapura (City of Gems) in Sri Lanka (Ceylon) and emeralds from the Swat Valley of Pakistan. Among the nonprecious gems were topaz, agate, lapis lazuli, onyx, quartz, zircon, carbuncle, cat's eye, pearls, and red coral. Seasonal large-scale pearl fishing was concentrated in the waters between Sri Lanka and the southern coast of mainland India. The industry was so famous that the *Catalan World Atlas* of 1375, drawn in faraway Majorca, depicted pearl divers off of the Malabar Coast of southwestern India.

Bahmani glass was a high-quality glass developed in the Deccan under the Bahmani sultans of the fourteenth and fifteenth centuries. Its main products were bangles, bowls, and flasks in different colors. An innovation was the manufacture of more complicated glass beads, especially opaque white beads with impressed design and green beads intermingled with yellow. Glass beads were manufactured at several centers in the Deccan and the Ganges Valley.

The introduction of the technique of paper-making is attributed to the sultan of Delhi, Firuz Shah Tughlaq (r. 1351–1388). Ma Huan, a Muslim Chinese interpreter who traveled to India in several of the early-fifteenth-century fleets of Zheng He, noticed a white glossy paper made from the bark of a tree during his visit to Bengal. Toward the end of the fifteenth century, Gujarat had become India's largest paper producer. Sultan Zainu al-Abidin (r. 1423–1474) introduced the technique from Samarqand into Kashmir in the early fifteenth century. Within a few years Kashmiri paper became desired for its durability and strength, and Zainu al-Abidin presented it as a gift to dignitaries. Paper production is said to have been introduced into Nepal from China via Tibet already in the seventh century.

Pottery was but one of the many minor industries. Unglazed pottery was made in practically every settlement. Glazed pottery, on the other hand, was limited to regions in Sindh, Punjab, and Tamil Nadu. The earliest remains date back to the fourteenth century. Glazed tiles became popular only toward the end of the fifteenth century.

Muslim Trading Groups in the Indian Ocean

Around the turn of the first millennium CE, trade in the Indian Ocean underwent a number of structural changes. Long-distance single-voyage trade between east and west became segmented into three distinct trade circuits centered on the Arabian Sea, the Bay of Bengal, and the South China Sea, respectively. This system reflected the navigational range of the seasonal monsoon winds and allowed merchants to realize a faster return on their investments. As a result, regions situated on the intersection of these trade circuits, such as southern India or coastal Southeast Asia, developed into key transshipment centers. This development was accompanied by the spread of Muslim communities along the ocean's littoral. The rapid expansion of Islam across the Indian Ocean has led historians to characterize it as a Muslim lake. While this description overlooks the continued role of Jewish, Indian, Southeast Asian, and Chinese traders, it rightly emphasizes the increasing prominence of Muslim trading groups in the region's maritime commerce between the years 1000 and 1500.

Arabs and Persians had traded with India since ancient times, but with the rise of Islam and the formation of powerful Islamic caliphates,

these contacts expanded in scope and frequency. This expansion was also driven by the prosperity of China under the Song dynasty (960–1279), when the country's population and economy increased enormously, drawing in trade and traders from across Asia. Increased contacts and trade were the basis for the spread of Islam along the Indian Ocean littoral. Muslim merchants financed the construction of mosques in overseas ports and were followed by religious scholars and Sufis. Inter-marriage of expatriate Muslim merchants with local women and conversion integrated Islam into coastal societies across the Indian Ocean and produced familial links between Muslims in Arabia and Asian port cities. This was of special importance for trade, as medieval long-distance commerce was usually organized along kinship lines.

In the absence of regular communication, merchants tended to organize their businesses through agents drawn either from their own family or other families connected through marriage or a shared origin. This form of organization was typical of trade diasporas, a term that historians use to describe merchant groups that live in foreign lands for the purposes of trade. Trade diasporas were the most efficient form of business organization in premodern trade because their internal coherence made it possible to have diaspora members situated in a number of foreign locations. Trade diasporas were thus able to send capital to purchase goods abroad, learn about market conditions in different ports, and deal with misconduct by excluding aberrant members from future transactions. Such groups were usually internally stratified, with apprentices learning the trade, itinerant traders who undertook the sea crossings and spent time in overseas ports, and senior merchants who remained sedentary.

Muslims born of intermarriages were particularly suited to act as brokers; they usually adhered to the Islamic faith of their father and learned at least some Arabic but were also fluent in the local language and culture. Similarly, converts to Islam could serve as local links in the far-flung chains of Muslim trade networks. The establishment of Muslim communities in port cities in East Africa, South and Southeast Asia, and China thus provided an infrastructure and

➤ MONSOON-STYLE MOSQUES

South Indian and Southeast Asian mosques are a vivid illustration of how Islamic culture spread along the Indian Ocean littoral, not as a monolithic practice but in a dialogue with existing cultural traditions. The Malabar Coast in southwestern India was one of the earliest sites of mosques on the subcontinent. Malabar's old mosques stand in strong contrast to archetypal Islamic mosque designs. They do not feature domes or minarets but instead show clear similarities to the region's vernacular houses and Hindu temples. Their style is partly the result of the local conditions—for instance, the steeply sloped roofs were necessary to cope with the heavy rainfall—as well as the availability of building materials and the skills of local craftsmen. Yet their design also shows a desire to reflect the existing ritual architecture, presenting the mosques in a way that was instantly recognizable as a sacred structure in Malabar. Moreover, since Malabar's Muslim communities were founded within the context of Hindu states, there was little impetus to use their sacred structures to visually demonstrate the beginning of a new era, as would happen in northern India after the establishment of Muslim rule in the twelfth century.

Mosque architecture in coastal Southeast Asia, where Islam was also introduced peacefully by Muslim traders and itinerant Sufis, is closely analogous to that of the Malabar Coast. This similarity has prompted the historian Stephen Dale to speak of a distinct commercial monsoon style of Islamic religious architecture in the Indian Ocean

Mithqalpalli is one of the largest mosques in Kozhikode (Calicut), on the southwest coast of India. It was constructed by Nakhuda Mithqali, a local trader, in the fourteenth century. The Portuguese burned the building in 1510 and it was reconstructed later. (Sebastian R. Prange)

littoral. Inscriptions show that many of the early mosques of coastal South and Southeast Asia were financed or endowed by Muslim merchants or shipmasters who had settled in these regions. Such mosques provided an important resource for maritime traders as well as a focus for the emerging local Muslim communities. They exemplify the transition of Islam from an Arabian faith to a cosmopolitan religion that linked its adherents across the Indian Ocean world.

—Sebastian R. Prange

framework within which individual trade networks could flourish and interact. While Muslims continued to trade with merchants of different faiths, there were advantages to dealing with other Muslims. These included the common use of the Arabic language (although not all Muslims spoke Arabic, it became the lingua franca of Indian Ocean trade) and the shared legal standards of Sharia in case of disputes. Muslim trade also benefitted from the development of other networks such as the circulation of religious scholars and Sufis, who often had kinship links to merchant families and frequently engaged in trade

themselves. Muslim networks thus overlapped and interacted on various levels. The pilgrimage to Mecca (*hajj*) further promoted connections as well as served as a platform for trade between Muslims from across the Indian Ocean world.

The fourteenth-century travelogue of Ibn Battuta gives a vivid impression of the span and organization of these Muslim networks. For example, in southern China he met a fellow Moroccan, a Muslim scholar whom he had previously met in Delhi. Even more remarkably, some years later Ibn Battuta encountered this man's brother in a Saharan trading town. Muslims were able

to move within these networks and profit from their family connections, scholarly training, and religious prestige. However, the trading groups that formed Muslim networks were not monolithic but instead were highly diverse; often, they stood in competition to each other. Muslim trading groups were differentiated not only by kinship affiliation and place of origin but also by their adherence to different religious denominations, schools of law, or Sufi orders. The Bohras of Gujarat in western India, for instance, were a particular subgroup of Shia Islam prominent in maritime trade, an association already apparent in the name “Bohra,” which is derived from the Gujarati word for “trader.” Groups such as the Bohras, who over time split into further subgroups, persisted because of their clear understanding of who belonged to the community and who was outside of it. Business misconduct was discouraged by the threat of exclusion from the group. There were many similar Muslim communities active in the Indian Ocean trade that were identified with a specific region, the specialization in particular trade routes or goods, or their religious beliefs and cultural practices.

In contrast, there were also merchant networks that seem to have been inclusive rather than exclusive. The Karimi merchants of Egypt, who from about the twelfth century played a key role in the spice trade from India to Europe, are an example of such a group. While all of the Karimi merchants recorded in the sources were Muslims (although some were converted Jews or Christians), group membership was not based on the adherence to any particular belief or legal school within Islam, as in the case of the Bohras. Rather, status, wealth, and business acumen seem to have been the crucial admission criteria for this association. Its close links to the ruling elite and the sheer profitability of its commerce ensured its longevity. The commercial preeminence of the Karimi merchants was only eroded in the fifteenth century, when the Egyptian ruler attempted to bring the spice trade under more direct state control.

The fate of the Karimi highlights a crucial aspect of the operation of trade networks: their relationship to political power. The immense wealth of long-distance merchants always formed

a temptation for rulers. Rulers could expect little opposition when seizing assets of expatriate merchants, who usually had no entrenched local power base. However, the international nature of the merchant networks meant that they could respond to political pressure by relocating to other locations. On the Malabar Coast, for example, Muslim merchant groups were able to exploit the competition between different princely states over the revenues of maritime trade to gain favorable conditions for the continued pursuit of trade as well as a degree of political influence. Merchants could also be useful to rulers in other ways, such as through their knowledge about conditions in other ports or even by supporting military expeditions with their ships and sailors.

Networks are by their nature difficult to study: they evolve, overlap or decay, and rarely constitute a defined entity that can be unambiguously identified in the sources. In recent years, social network analysis has provided new ways of examining such trading groups. It focuses on connections between individuals, the flows of communication, and the emerging patterns of organization. This allows for a more flexible approach to studying the multidimensional relationships within and between networks and their evolution over time.

Hormuz and Aden—Cities Built on and for Commerce

The material wealth of the medieval Indian Ocean world was clearly reflected in the prosperity of its great port cities. In the late thirteenth century Marco Polo, who had grown up in Venice and was thus accustomed to the sight of thriving trade, marvelled at the immense commerce of Hormuz and Aden, the former at the mouth of the Persian Gulf and the latter near the entrance to the Red Sea. Some 50 years later, the Moroccan wanderer Ibn Battuta confirmed this impression by describing the great wealth that merchants in these ports possessed, especially from their lucrative trade with India. Strangely, Hormuz and Aden on the face of it had little to recommend themselves as cities of commerce. They did not produce trade goods, suffered from unfavorable climatic conditions, and had to import not only all the crops needed to feed their inhabitants but also fresh water. That in spite of these limitations they developed into two of the most prominent port cities in the western Indian Ocean is testament to the key importance of location: the prosperity of Hormuz and Aden was built on their positions on the strategic choke points of maritime trade routes that enabled them to funnel the riches of Asia through their harbors, customhouses, and markets.

Hormuz (also known as Ormus or Hurmuz) was originally situated on the eastern mainland at the entrance to the Persian Gulf, but around the year 1300 its king, exasperated because of increasingly frequent raids by marauding tribes, moved all its inhabitants to an island a short distance off the coast. It was in this location that Hormuz developed into a major entrepôt, linking the trade within the Gulf (most importantly with Basra, which connected it to the Euphrates and Tigris rivers), Persia's overland trade routes, and the maritime trade in the Arabian Sea. The latter was of particular significance, as the monsoon wind system provided swift and predictable communication with the ports of India's west coast from whence the lucrative trade goods of Asia could be imported. Of particular importance to Hormuz was its trade in horses, which were brought from the Iranian steppes and the

Arabian Peninsula to be sold to Indian rulers for whom the animals were of great military significance.

While Aden was farther from India, merchants were attracted to it for its links to the Arabian caravan routes; the short sea crossing to East Africa, where gold, slaves, and ivory could be obtained; and, most crucially, the Red Sea route toward the rich markets of the Levant and Egypt. Of key importance was Aden's role as a clearinghouse for the trade in Yemeni incense as well as Indian and Southeast Asian spices. This is evident, for example, in the records of Jewish merchants of the eleventh and twelfth centuries. These also show the complex business practices of Aden's merchants that included the provision of credit and insurance, investments in diverse trading ventures, regular correspondence with agents in overseas locations in order to ascertain market conditions, and dealing with numerous different currencies, weights, and tax regimes.

Hormuz and Aden also exemplify the competition between the trade circuits centered on the Persian Gulf and the Red Sea, respectively. In 1250 the Mamluks took control of Egypt and soon expanded its sphere of influence over Aden. The stability and prosperity of this dynasty underpinned a flourishing of trade relations among Egypt, East Africa, India, and China, with Aden as the key entrepôt. Hormuz, on the other hand, experienced a temporary decline in its trade as a result of the Mongol conquests and insecurity on the caravan routes. A century later, however, Hormuz benefited from the strength of the Timurid empire for which it provided an important link to the maritime trade routes, while Aden and the Red Sea route suffered from the contraction of Mamluk power that resulted from the devastating impact of the plague on Egypt. These developments highlight that the commercial fortunes of port cities such as Hormuz and Aden fluctuated with the broader economic and political trends. At the same time, they were able to preserve a remarkable degree of autonomy. While rulers were at times tempted to extract higher taxes or even appropriate merchants' wealth outright, they also recognized that the revenues of maritime trade were dependent on merchants frequenting the ports. In this way, the competition between Hormuz and

THE GENIZA LETTERS

A unique insight into the activities, organization, and mind-set of medieval merchants is afforded by a set of sources known as the Geniza documents. In Judaism (as in some other religions), it is believed to be sacrilegious to destroy documents that contain the name of God. As most letters and business documents invoke the divine in phrases such as “God willing,” “God be my witness,” or “thanks be to God,” a place was needed to deposit unwanted papers. One solution was the construction of a discrete chamber, known as a *geniza* and often attached to a synagogue, for this purpose. When the chamber was full, it would be sealed and over time might no longer be remembered or even distinguishable from the general edifice. One such chamber was discovered in Cairo in the late nineteenth century. Soon European scholars and antiquity dealers learned of this discovery and bought the papers, most of which were fragments, by weight. Although the University of Cambridge was able to assemble the single most comprehensive archive, many of the Geniza documents remain dispersed in public and private collections in Europe, Russia, and the United States. The documents are written in a style called Judeo-Arabic that is in the Arabic language but rendered in the Hebrew script.

The Cairo Geniza is of particular importance because it contained a large volume of secular documents from Jewish traders operating in the Mediterranean Sea and the Indian Ocean between the eleventh and thirteenth centuries. Official and private correspondence, contracts, invoices, bills of lading, and such give an unparalleled insight into their business practices. Although mostly concerned with the Jewish traders who transferred

Fragment from the Geniza documents, early thirteenth century. (Isadore Singer, ed. *The Jewish Encyclopedia*, 1901)

the documents to the Cairo Geniza, they also show their interaction with merchants of other faiths and origins. They are a crucial source for the trade of Aden, where Jewish traders were integrated into the Islamic state and occupied key commercial and political positions.

—Sebastian R. Prange

Aden protected both from overbearing political interference.

On the Way to Egypt—Commerce on the Red Sea

Between the eleventh and fifteenth centuries, the Red Sea was a major thoroughfare for trade between Egypt and the Mediterranean world and the ports of East Africa and the Monsoon Seas of Asia as far as China. This period is bracketed by the Fatimid conquest of Egypt in 969 and the Portuguese opening of a sea route from the Atlantic to India in 1498. Coincident with

► THE PORT OF JEDDAH

In the seventh century, the ancient fishing port of Jeddah was designated the port of entry for seafaring pilgrims bound for Mecca, about 40 miles (65 kilometers) away, to which all Muslims who can afford to are obliged to make a pilgrimage at least once. The northern half of the Red Sea is uniformly arid, a fact noted repeatedly by visitors. The tenth-century Arab geographer al-Muqaddasi wrote of Jeddah:

“A fortified, well-developed, populous place, its people are merchants, and well-to-do; it is the merchant of Makka, the entrepôt of al-Yaman and Misr [Egypt]. Here is a distinguished mosque. However, the people here suffer great inconvenience from deficiency of water, though the town has many reservoirs; water has to be brought from some distance away. The Persians are the predominant class there, where they have splendid mansions. Its streets are straight, the situation excellent, but the heat excessive.”

Four centuries later, Ibn Battuta was similarly impressed by the “pits for water, bored in the solid rock and connected with each other in numbers beyond computation. This year was one of little rain, so water was brought to Judda from the distance of a day’s journey.”

—Lincoln Paine

these epochal events were the decline of the Abbasid caliphate at Baghdad and the resulting contraction of commerce on the Persian Gulf from the tenth century as well as the Ottoman conquest of Mamluk Egypt in 1517.

Evidence for the trade of the Red Sea in this period is varied but sparse and ranges from Arabic and Persian geographical and historical writings to the eleventh- and twelfth-century Judeo-Arabic correspondence of Jewish merchants sailing to India (the so-called Cairo Geniza letters), a small collection of thirteenth-century correspondence found at the Egyptian port of Quseir, and fifteenth-century Arabic navigational treatises. These have been supplemented by archaeological investigations at some of the sites most frequently mentioned in written sources.

As well as being a source of fish and coral and an avenue of communication for people native to its shores, the Red Sea is best known for its role in the trade between Egypt and the East and as a major route for Muslim pilgrims making the hajj to Mecca via Jeddah, the most important port on the west coast of the Arabian Peninsula. On the opposite shore there were four major ports spread at almost equal intervals across 870 miles (1,400 kilometers): Quseir, 90 miles (150 kilometers) due east of Qina on the Nile; Aydhab/Halaib, on the Egypt-Sudan border; Sawakin, Sudan; and the Dhalak archipelago near Massawa, Eritrea.

For much of this period the busiest port was Aydhab, which from at least the eleventh century was, according to the Persian pilgrim Nasiri Khusraw, “a custom station for ships coming from Abyssinia, Zanzibar and the Yemen,” including Aden (in Yemen), a major stop on the way to and from India. Aydhab is also the most frequently mentioned Red Sea port in the Geniza letters and seems to have been a major rendezvous for merchants. Its most important function, however, was as the terminus for pilgrims en route to Jeddah, less than 190 miles (300 kilometers) to the east. While the route via Aydhab is mentioned earlier, this traffic picked up dramatically after the start of the crusades and the Christian threat to the overland route via Sinai and the Hijaz.

One of the imperatives of the Fatimid, Ayyubid, and Mamluk rulers of Egypt was to protect

access to the holy sites of Mecca and Medina, and they denied Christians direct access to the commerce of the Red Sea. However, they proved less effective in countering indigenous threats to merchants. Piracy was widespread throughout the reef-strewn sea, and there were hostilities between regional powers on either shore, notably in the early twelfth century when the ruler of Mecca attacked Aydhab. The only crusader to launch attacks on the Red Sea, Reynald de Châtillon, sank 16 ships at Aydhab in 1183 before being routed by an Ayyubid squadron, but this was an extraordinary undertaking. To compensate for the inadequacies of state protection against piracy, merchants formed a *karim* (a convoy of ships that sailed together for mutual protection) that quickly dominated the trade to India. The Mamluks undercut anyone they suspected of amassing excessive influence, and the later *karim* may have evolved to protect merchants from arbitrary seizures of their goods as much as from pirates. Sultan Barsbay monopolized the spice trade in 1429, but the opening of direct trade between Europe and India in 1498 caused an irreversible shift in the Red Sea's place in world trade.

■ Introduction: China, Economic Powerhouse of Afro-Eurasia

China during the era of the Song dynasty (960–1279) experienced massive growth and development of its economy. Although Song China was not as territorially large or even as militarily powerful and significant as the preceding Tang dynasty or the successor Yuan or Ming dynasties, Song China's economy experienced massive expansion. This commercial and industrial revolution elevated China to an economic level that was markedly higher than earlier periods and produced an institutional framework that remained in place well into the nineteenth century. Achievements in many fields of endeavor during this creative age placed China in the forefront of global technological innovation, material production, political philosophy, governmental institutions, and high culture. Explosive economic and cultural growth, how-

ever, contrasted sharply with a decline in military power, which in time made China susceptible to non-Chinese military invasion and domination from the north and west.

A major factor in the technological and material growth during the Song was a dramatic rise in population and urbanization. China's population, officially tallied at about 60 million around the year 2 CE, declined in later centuries and seems to have regained the 60 million threshold at the height of the Tang dynasty in the mid-700s. The population grew to about 100 million during the Northern Song era (960–1126) and stood at about 120 million at the end of the twelfth century, during the early stages of the Southern Song dynasty (1127–1279). The city of Kaifeng, the political and administrative center of Northern Song, had a population approaching

1.5 million. Hangzhou, which became the so-called temporary capital of the Southern Song dynasty after Ruzhen (Jurchen) invaders took over Kaifeng in 1126 and established the Jin dynasty in northern China, grew even larger. Before the Mongol conquest of 1279, Hangzhou had a population of well over a million (and some estimates put it at between two million and three million).

The growth of these and other Chinese cities fostered the growth of private commerce. While earlier Chinese dynasties had sought to control and even restrain trade, commerce grew so rapidly during the Song period that it soon outgrew these restrictions.

Major commercial cities began to appear for the first time which, unlike earlier Chinese cities that had mainly been centers of political administration, were now great emporiums of trade. Cities also became great centers for cultural and social life with vast numbers of restaurants, teahouses, theaters, specialty stores, and many other kinds of commercial establishments.

The rapidly rising population led to an abundance of cheap labor. The great concentration of wealth in the town and the poverty of rural areas combined to promote a constant flow of labor into the major urban centers. Cheap labor allowed major commercial establishments and industries to reap major profits that they could reinvest in their businesses, thus enhancing growth. One result of the growth in the labor supply was an extraordinary degree of specialization. The labor market was very well organized thanks to the growth of guilds, which acted as major employment exchange centers. It was to them that both employers and employees applied.

Kaifeng's location at the junction of the Yellow River and the early Grand Canal, at the head of barge transport from the Lower Yangzi grain basket, made the city the wealthiest in China and the center of its commercial and industrial revolutions. One major innovation of Song ironworkers was a decarbonization method for steel-making. Water transport to the capital of iron and coal from mines in northern China allowed the vast expansion of pig iron. By 1078 China was producing more than 114,000 tons annually,

twice the amount that Great Britain would produce 700 years later.

Technical advances also led to the rapid improvement of traditional industries. There was a vast expansion in the quantity and quality of silk textiles, lacquerware, and porcelains, stimulating trade as demand for Chinese goods grew. Another technological advance was the development of gunpowder for explosive weapons. Chinese developed mines, hand grenades, and other explosive projectiles that compensated somewhat for the weakness of China's weak cavalry. The abacus came into use and for centuries remained the main calculating device for merchants across East Asia.

There was a massive expansion in agricultural production during the Song years. The introduction of a quickly maturing strain of rice from the Champa region of Vietnam greatly increased rice yields in southern China. Major water-control and irrigation projects across China greatly increased the total area that was devoted to irrigated paddy fields. The result was an almost doubling of China's rice production between the eleventh and twelfth centuries. There was a massive increase in the production of tea on hillsides and of cotton, which greatly accelerated China's textile industry. Improved road and water transportation greatly spurred domestic and international trade and encouraged the growth of regional specialization in crops, which brought much higher yields in many areas.

Vast improvements in nautical technology improved China's prospects for trade. China developed the world's largest compartmented ships, with as many as four decks, four to six masts, and a dozen sails. The ships, now guided by a sternpost rudder and the use of complex charts and the compass, could go on long voyages overseas, carrying as many as 500 passengers and crew.

The Song dynasty also saw the massive expansion of printing and printed books. Although paper had existed in China since the early Han dynasty, improved techniques for making paper from plant fibers and the development of woodblock printing led to an explosive demand for paper and for printed books. Printed books led to simultaneous growth in the number of schools, a

vast increase in general literacy, and an improvement in the quality of students taking the exams that staffed Song's government bureaucracy.

China's economic wealth and technological progress, however, did not translate into military power. The result was that Southern Song resisted bravely but ultimately succumbed to the invading Mongols, who terminated the dynasty in 1279, after years of bitter fighting, especially in China's southern regions.

—*Daniel A. Métraux*

Chinese Light Industry from Song through Early Ming

The period from the Song dynasty to the early Ming era (960–early 1400s) witnessed a vast expansion in the production and demand for a wide variety of light industrial goods including porcelain, silk and other textiles, lacquerware, and furniture as well as printed books. The development of a vibrant handicraft industry in the southern areas of China promoted the growth of a strong market economy, regional specialization, and rapidly growing urbanization. Production of high-quality goods for the growing number of middle- and upper-class Chinese households as well as for an expanding export market rivaled the manufacture of lower-quality goods for ordinary Chinese.

Porcelain was one of the major growth industries of this period. Although invented several centuries earlier, porcelain became a major daily commodity during the Song dynasty not only for the upper classes but for lower social groups as well. One factor leading to the increased use of porcelain was the government's prohibition of using bronze for items of daily use. The beauty, durability, and lower price of porcelain made it a worthy replacement material. Another factor in the product's startling growth was the huge demand it generated in trade, first by land and sea across Asia and even to East Africa and, much later, across oceans to Europe and the Americas. Mass production of this chinaware often occurred in kilns that could fire as many as 20,000 pieces at once.

The Song government heavily promoted the manufacture of silk and other textile materials.

THE PORCELAIN OF JINGDEZHEN

The most famous porcelain in China was produced in the kilns located at Jingdezhen in the north-central region of the country. Founded during the Yuan dynasty, Jingdezhen gained worldwide recognition for the quality of its products when the imperial porcelain factory was established there during the early years of the Ming dynasty. Working with a long tradition of making fine pottery, Chinese potters during the Song period had developed the technique of using a special form of clay now known as *gaolin*. When the clay is covered with a glaze and fired at a temperature of about 1,400 degrees Centigrade, the body fuses. The resultant object, now turned white, is so hard that it is impervious to liquids, is resonant when struck, and cannot be scratched with steel. Jingdezhen porcelain, which had a brilliant monochromatic glaze, was sold to the imperial court and to wealthy Chinese families. It was also eagerly sought by foreign traders. Long before the technique for making fine porcelain reached other peoples, Chinese porcelain, which was known by the Persian term *chini* (chinaware) in western Central Asia and India, was highly valued throughout Eurasia and in parts of Africa.

—*Daniel A. Métraux*

The state controlled numerous silk and brocade production facilities and hired the requisite number of workers rather than resorting to *corvée* labor. Whereas during the Tang period (618–906) most silk manufacture was located in northern China, the very real danger of foreign invasion during the latter Song dynasty forced the transfer to points farther south. By the Ming dynasty the largest state manufactures could be found in Suzhou, Chengdu, and Hangzhou.

There was also a huge expansion in the manufacture of cheaper coarse clothing made of hemp, linen, wool, and cotton. Cotton, first introduced from the southern island of Hainan early in this period, became a major crop in southern China and led to the growth of a major cotton textile industry in the Shanghai region and elsewhere in China.

Driving this upsurge in textile production but also made necessary by the great upturn in

consumer demand during the Song period was the invention of massive water-driven spinning wheels and other sophisticated textile manufacturing machinery that, with a minimum of operators, could perform the work previously performed by many hands.

During the Song period, many kinds of high-quality furniture were manufactured for upper- and middle-class families, including tables, chairs, stools, beds, and benches. Highly decorated waisted cornerleg furniture grew in popularity among the elite. Other basic patterns of furniture continued to mature in the Yuan and Ming periods into well-rounded and robust forms that were often smoothly finished with lacquer coatings and finely detailed with painted decoration. Later in the Ming period furniture made of durable imported hardwood from Southeast Asia became popular, especially among the scholar official class and the rising nouveau riche merchant class. The use of hardwoods led to advancements in joinery techniques and the creation of open and elegant forms of furniture not available with softer domestic woods. Furniture, smaller lacquer products such as mirrors, and even jewelry became increasingly important export items throughout Asia during this period and to the West in later years.

Although lacquerware was a very old art form in China, there were significant advances and expansion in the production of lacquerware during and after the Song period. Common products employing some degree of lacquer (a lustrous varnish made from tree sap) included plates, furniture, musical instruments, and coffins. The increased wealth of urban and rural elites led to a high demand for luxury goods made with lacquer. This demand in turn gave rise to greater varieties of lacquerwares, among which the most distinctive style was single-color lacquer work that required very meticulous craftsmanship. Like so many other Chinese products of the period, lacquer also became an important export item.

Starting in the Song period, printing became very common, and printed books of all kinds appeared in large numbers. Because of the vast number of Chinese characters used in writing, the Chinese generally found it easier to have a whole block of wood, usually representing two

sides of a page or pages of a single folded sheet of a book, carved as a single unit. The need for paper increased substantially, and paper production became a much more important industrial branch than ever before. The development of printing and vast improvements in the production of cheaper high-quality paper led not only to an explosion in the production of books and in the number of book stores but also to an increase in general literacy. Books included works of poetry, numerous encyclopedias and gazetteers, and the vast canon of Buddhist sacred literature.

Commercial Crops

During the period of the Northern and Southern Song dynasties (960–1279), all regions of China experienced a major agricultural revolution, with an enormous expansion of commercial crops. The success of Chinese agriculture contributed significantly to China's huge population growth rate throughout the Song era and played a key role in the transformation of Chinese cities from centers of political administration to great emporiums of trade. The increase in the volume of agricultural trade products greatly encouraged the regional specialization of crops, which in turn brought greater and at times higher-quality yields.

Historians often refer to the enormous commercial revolution of the Song era as being premodern in character. The growth of nonagricultural cottage industries, such as silk, together

with the proliferation of cash crops led to the extension of market forces into the lives of ordinary Chinese, and this pattern of economic development remained in force well into the twentieth century.

After the economic dislocation of the later years of the Tang dynasty (618–907) and the subsequent period of division (907–960), agricultural production had declined markedly. One of the early acts of the new Song government was to encourage the vast expansion of new plowed land and to inaugurate well over 10,000 significant irrigation projects. There was also extensive dike building, land reclamation, and construction of dike-pond systems in the Pearl River Delta in South China as well as in other areas across China. Extensive use of a curved iron plow developed during the Tang era as well as a new steel plow for reclaiming wasteland greatly enhanced the spread of cultivation.

Another factor in the transformation of barren land into good crop land and the recovery of overfarmed plots was the introduction of night soil (human excrement) as a fertilizer. Farmers used at least ten kinds of fertilizers, ranging from human and animal excrements to ash and varieties of mineral salts and silts. Fertilizer was especially important in such densely populated areas as the lower Yangzi region, where multiple fertilizing permitted several harvests a year.

There were also important advances in cultivation techniques. Farmland in South China was often rotary, alternating between wet field and dry field. For example, during the Southern Song era, while three harvests of wet rice were possible, after the second rice harvest, beans, sesame, or hemp was often planted in the dryer areas. Moreover, the growing of wheat, originally a crop of the north, became more common. Mulberry trees, essential to silk production, were also often planted in drier areas to supplement individual farm family incomes. Hemp plants, whose roots had different lengths and exploited the soil in different strata, were planted alongside the mulberry trees.

The result of these efforts was the tripling of cropland across China as well as the diversification of agricultural products. There were also significant improvements and changes in the quality of food products grown in China. For ex-

➤ THE SONG TEA CEREMONY

Tea drinking became the rage among government leaders and leading intellectuals during the Southern Song period (1127–1279). It was stylish to read poetry, write calligraphy, draw or paint, and discuss philosophy or the affairs of state while sipping cups of tea.

In this period, a new powdered form of tea became popular. Tea leaves when picked were quickly steamed to preserve their fresh form and color. The leaves were dried and ground into fine powders that were then whisked in wide bowls. The tea produced in this manner became widely known for its deep emerald or iridescent white color and its ability to rejuvenate the body. The white tea was prized above all and was often used in the famous whisked tea competitions of that era.

Over time this Song style of tea preparation incorporated powdered tea and refined ceramic ware in an aesthetic ceremony that became known as the Song tea ceremony. Japanese monks visiting China at the time studied Song tea preparation and brought it home with them. Although the Chinese later abandoned this practice, this Song style of tea evolved into the Japanese tea ceremony, which endures to this day.

—Daniel A. Métraux

ample, Chinese had been growing rice for many centuries, but the introduction of blends of high-yield Champa rice from southern Vietnam, known for its rapid maturation, greatly increased rice yields in southern China. Overall, it is thought that the rice crop across China more than doubled in the eleventh and twelfth centuries.

Cotton, which was introduced to central China from Hainan Island, became an important cash crop during the Song period and greatly added to the textile resources of the country. Extensive areas on the Jiangnan Plain north of the Yangzi and major portions of Shanghai and neighboring countries experienced major cotton cropping. At the start of the Song dynasty, most ordinary people wore clothes made of plant fibers such as hemp, ramie, kudzu vine, and so on, but by the end of the period, cotton textile clothes were most common. Woven cotton cloth

rapidly exceeded but did not totally replace earlier use of ramie and linen. Hemp, from which linen was made, was still widely planted.

There was also a major increase in the number of mulberry farmers who grew considerable numbers of mulberry trees and bred silk-worms. Consequently, the cost of high-quality silk dropped, and it became the fabric of choice for wealthier families across China. The Chinese silk industry expanded greatly during this period, producing increasingly higher qualities of goods not only for domestic consumption but also for foreign export, particularly to Southeast Asia.

Tea, most often grown on hillsides across China, became an important cash crop of the Song period. The methods involved in the production and preparation of tea underwent extensive change. The tea of Song included many loose leaf styles, and a new powder form of tea also emerged. Sugarcane had long been grown in China, but there was a rapid increase in the growth and commercialization of cane throughout the period. Advancements in technology allowed the milling of sugarcane into powdered sugar.

The growth of cities led to the rapid growth of highly specialized vegetable farms in the suburbs that grew a wide variety of green goods as well as other products for highly lucrative urban markets. Song-period peasants cultivated more than 30 kinds of vegetable and planted dozens of fruit species, among them many different kinds of citrus fruits. A growing number of nurseries produced flowers, notably peonies, for these urban markets as well.

The result of this agricultural revolution was that China remained largely self-sufficient in food production, even as the population grew by millions over the next few centuries.

China's Inland Waterway System

China's inland waterway system, built around the Grand Canal that linked northern China with the south, reached its height during the Yuan (1279–1368), Ming (1368–1644), and Qing (1644–1911) dynasties. The canals permitted the easy and secure flow of grain and other foods, military supplies as well as troops, and other commodities. The construction of the canals greatly enhanced both the domestic security and the prosperity of China before the coming of the West. The building of the canals also required several innovations in canal engineering, including the construction of locks.

China's main rivers, the Yellow River (Huang He) and Yangzi (Chang Jiang), flow from west to east. The result is that China has no natural communication route running north to south except for the coast. The Chinese compensated for this deficiency through the construction of the Grand Canal system, one of the great feats of premodern hydraulic engineering. The canal linked the two great rivers and made it possible to move grain and other commodities from major agricultural centers to the principal cities of China. At its height during the Ming dynasty, the Grand Canal system extended 1,553 miles (2,500 kilometers) from Beijing in the north to Hangzhou to the south and Luoyang to the east. The result was the connection of the political centers of the Chinese empire in the north with the critical agricultural and economic regions of central and southern China. The canal system also linked China's two most important river basins and breadbaskets, the Yellow River and the Yangzi River.

The first elements of the Grand Canal were built by the Sui dynasty after 605 CE for both commercial and military purposes. It was extended on several occasions. One of the great bursts in canal building occurred when the Mongols established their capital at inland Dadu (present-day Beijing) and extended the canal all the way north of Dadu/Beijing to join a river system at Tianjin (the Son of Heaven's River Ford), thereby transforming a village that had access to the sea by way of its riverways into a prosperous maritime city by the time of the early Ming. Dur-

► THE YANGZI AND ITS TRIBUTARIES

The Yangzi, or Chang Jiang, the third-longest river in the world at 3,900 miles (6,300 kilometers), courses through the heart of China and has been the geographical and cultural divider between the northern and southern portions of the country since earliest days. Rising in far western China and traversing eight provinces before entering the East China Sea, it has over 700 tributaries, the most important of which are the Yalong, Min, Jialing, Tuohe, Han, and Fushui rivers.

The Yangzi is geographically divided into three parts. The Upper Yangzi reaches from its source in Qinghai Province to Yichang in Hubei Province, a distance of 2,700 miles (4,400 kilometers). This stretch is one of great beauty, traversing vast mountain ranges, and it has served, especially during the Song era and following, as the source of inspiration for countless poets and artists. The Middle Yangzi reaches Hukou at the mouth of Poyang Lake in Jiangxi Province, a distance of about 620 miles (1,000 kilometers). Here, the river

widens and flows through flat low-lying land and is fed by waters from two huge lakes, the Dongting and the Poyang. The Lower Yangzi reaches 560 miles (900 kilometers) through flat delta plains to the estuary.

Given its fertility, the Yangzi served medieval China not only as a means of rapid transportation of bulk items and a source of inspiration for flights of artistic creativity but was also a breadbasket, especially for the production of rice. Most of China's rice was produced in this region, as opposed to the wheat-producing north. It was also the source of high-quality protein in its freshwater fish and a major center of cotton production. This productivity allowed for China's rapid rise in population during the Song era and its equally rapid demographic recovery during the Ming era. Likewise, its cotton helped fuel China's immense textile industry during the era of the Southern Song (1127–1279).

—Daniel A. Métraux

ing the Ming and Qing dynasties, the Grand Canal made it possible for Beijing, the imperial capital after Dadu, to secure sufficient grain and rice from the south.

The extension of the Grand Canal system after 1000 CE required innovations in canal-building engineering. North of the Yangzi, the canal must ascend a slope of more than 131 feet (40 meters). To solve this problem in order to get barges up the canal and past rapids, the Chinese developed one of the world's first system of locks as well as a number of feeder lakes and lateral canals. The development of the more sophisticated pound lock is attributed to engineer Qiao Weiyo, who worked on the internal waterway system at the end of the tenth century. He constructed two flash locks on the Grand Canal only about 656 feet (200 meters) apart. He came to the realization that he had created a pool that would be at either the upper or the lower level of the canal depending on which barrier was open. Furthermore, the barrier separating patches of level water could be opened without the obstruction of water pressure.

There were further innovations in canal building during the Ming dynasty. Since seafaring was dangerous and could not allow for the adequate transportation of grain, the Ming by 1415 switched from relying on the transport of grain by sea to interior canal transport. The security of Ming Beijing therefore depended on further advances in the art of canal building to hold water in the steps of the watercourse crossing over the western spur of the Shandong hills. The Mongols had tried this with only limited success. The great breakthrough came in 1411 when engineer Song Li, the president of the Ministry of Works, and his staff were able to split the flow of the combined Wen and Si rivers at Ji Neng by means of a Heaven Well Lock and create a chain of 15 locks between Ji Ning and Lin Qing, at each of which officials could control water by opening and shutting the gates as seasonally necessary. This new waterway was 13 feet (4 meters) deep and 32 feet (10 meters) wide.

From a military point of view, the canals improved the interior lines of communication and the transport of supplies and troops. The canals

linked China's diverse economic regions into a unified whole and socially tied the nation together. Under these circumstances the control of a unified, stable, and prosperous China with a population of over 400 million people became a possibility.

Chinese Market Towns

A picture of the Chinese countryside taken from the air anywhere from the Song dynasty (960–1279) through to the early Ming period (1368–1644) would reveal a cellular tabloid below of endless stretches of contiguous market communities. During this period these largely self-sufficient communities consisted of a central market town surrounded by two or more rings of villages. The average Chinese market town was surrounded first by a ring of 6 villages and then by a second

ring of perhaps 12 villages. Each of these 18 villages had roughly 75 households, and each household might have an average of five persons, often two parents, two children, and a surviving grandparent. Each village was no more than 2 or 3 miles (3 or 5 kilometers) from the market town and was connected by footpaths or, on occasion, a waterway. Thus, even the farthest village from the town was an easy day's walk for the village farmer with a carrying pole, barrow, or donkey or, if using a waterway, employing a sampan. Market towns were generally in quite close proximity to each other, somewhere between 5 to 10 miles (8 to 16 kilometers) apart.

The farming village, which has formed the bedrock of Chinese society for many centuries, is formed from family units that are permanently settled there from generation to generation and depend on the use of certain designated land-holdings. Each family household was itself both a social and economic unit whose members made their living by deriving their sustenance from the fields surrounding the village. Life in the village followed the ebb and flow of the seasons. But it was the market town unit of villages rather than each village on its own that served as the center for social and economic life for the greater community.

The market town served as the hub of these villages and housed a town market as well as stores that sold basic goods to the villagers, shops maintained by artisans that served the agricultural community, and a number of specialty shops. There were also tea shops, where villagers could meet, and often a Buddhist or Daoist temple, where important social or religious events and festivals might occur.

Towns and their villages depended on the itinerant merchants to bring desired goods from other centers, since the average villager rarely traveled outside his own market town zone. These traveling merchants also brought news from the outside world and might convey messages from one town to another.

When added together, each market town community consisted of about 1,500 households, or 7,500 people. The villagers in each community often congregated together on market day, and it is estimated that a village farmer would visit the market town at least ten times in a month. While

Detail from an eleventh-century scroll shows the bustling town of Kaifeng, China. (Pierre Colombeau/Corbis)

these market town units were not self-sufficient, each market community was in effect a distinct economic unit as well as a self-contained social universe. Marriages often, but not always, occurred between individuals from different villages within the same market town unit. Most if not all significant festivals were celebrated in the town, and if there was a secret society there, their lodge meetings would be held at a regular locale in the town. And it was in the town that representatives of peasants might meet members of the ruling class, such as tax or rent collectors.

The market town system came of age during the heyday of the Song dynasty period. They fared less well under the foreign dominance of the Yuan dynasty but recovered in the early years of the Ming dynasty.

It is important to note, however, that despite the social cohesiveness of the market town unit, it was not an air-tight system. Often social networks like secret societies, militia groups, or the security system of mutual responsibility might work outside of the tight confines of the market town community.

China's Commercial Cities

The rapid expansion of the Chinese economy during the Song dynasty, coupled with a significant growth of China's population throughout China but especially in the south, led to the rise of both large and small commercial cities throughout China. These rapidly growing and expanding cities served as commercial hubs for surrounding market towns. The cities had large markets as well as artisans producing a wide variety of goods, general and specialty shops, teahouses and other places of entertainment, and administrative governments for the local region.

While China during the Tang dynasty had largely been an agrarian country, during the Song

➤ PERIODIC MARKETS

Unlike markets in the modern industrialized world, where a firm or a seller has a permanent place and a fixed schedule to sell its products, the rural marketers in China during the Song, Yuan, and Ming dynasties were mobile, and the markets operated on a regular but periodic basis. This system grew out of local economic necessity. Producers of goods in villages needed to divide their time between producing the goods for market and selling them at the market. Itinerant peddlers needed this arrangement so that they could travel from one market to another on a regular basis, since no one market could bring enough demand for all of their goods.

Market town networks operating in close proximity to each other held their market days on a periodic basis depending on the volume of goods produced and the seasons of the year. Neighboring market towns would often hold three markets during a set ten-day period. Town A, for example, might act on a 1-4-7 schedule while contiguous Town B might work on a 2-5-8 routine, allowing itinerant merchants to travel conveniently from one town to another and on to larger market towns and commercial cities to acquire goods for further distribution.

—Daniel A. Métraux

period China experienced a great increase in its urban population, which grew by factors of four and five. Kaifeng during the era of Northern Song had a population of 250,000 households, while Hangzhou, the major city of Southern Song, had nearly 400,000 households. Other regional cities also grew in size, as did larger and smaller market towns throughout China. Major urban centers grew along the Yangzi River, making the region the economic and cultural center of China. The construction, expansion, and repair of a vast network of canals including the Grand Canal, the growth of new industries and regional specialization of finished goods and crops, and the vast expansion of international trade during this period greatly bolstered China's market economy.

Although actual figures are sketchy, it is clear that China experienced a vast expansion of

➤ SUZHOU

Suzhou (Soochow), located on the lower reaches of the Yangzi River and the shores of Lake Taihu in Jiangsu Province, is an ancient market town. Renowned for its traditional beauty, Suzhou has often been referred to by the Chinese as both the Paris and the Venice of Asia. Suzhou has long been an important center of commerce and traditional industries as well as a haven for scholars, artists, and skilled craftsmen.

When the Grand Canal was completed near the end of the Sui dynasty (581–618), Suzhou found itself located on China's most prosperous trade route. It rapidly became an important regional center of trade, finance, and processing industries, especially for the weaving and dyeing of silk and other textiles. Silk produced in Suzhou had a brilliant empire-wide reputation and became a major export item as well. The neighboring Song-jiang region was a major center for cotton cloth production, using cotton sent through Suzhou from other provinces in northern and southern China and sending its finished products back through Suzhou for sale throughout China. Today, the city is a major tourist attraction famous for its stone bridges, pagodas, and intricately designed gardens.

—Daniel A. Métraux

trade and commerce between the eighth and thirteenth centuries. Early Tang dynasty rulers and officials, with traditional Confucian contempt and suspicion of commercial activity, had sought to control and restrict trade, but the explosion in commerce quickly made such practices untenable. Previously, much of China's commercial and cultural life had occurred in rural areas and towns and cities, but the expansion of commerce led to a growing demand for city and town markets, especially after 1000 CE.

Previously, markets had been carefully regulated and controlled, and there had been many restrictions on trading, with private dealers restricted mainly to luxury goods. Now, however, in the Song era, most of China's trade was in private hands, which further encouraged greater specialization in commercial activities. Cities and towns became larger and more numerous,

especially those along the major trade routes or chosen as provincial capitals. In brief, China's commercial revolution led to the establishment of open markets in commercial cities.

Indeed, a key to the rapid urbanization of Song China was a major commercial revolution that converted cities from being administrative centers into commercial centers. Many older urban centers had been small walled cities with old official marketplaces, but the growth of Song-era centers made the walled cities obsolete and spread commerce beyond the marketplace to shops of all sizes located throughout the city and surrounding areas.

China's urbanization was also, to some extent, brought on by the vast expansion of the nation's population during the Song period. Some scholars estimate that the Chinese population during Northern Song passed the 100 million mark, and the population in southern China is said to have tripled between the eighth and eleventh centuries. This huge growth in population led to the development of not only major metropolitan areas but smaller commercial centers as well. By the end of the Song dynasty, towns and cities with a population of almost 100,000 became commonplace all over China. This booming growth was particularly evident in southern China. Here the natural environment was more rewarding, land was more productive, and people were freer from older traditions and restrictions. All these factors favored conditions for the growth of commercial activities, and it was here in the south where many of the new market towns grew during this period.

Many smaller commercial cities grew up along the Grand Canal or the many smaller rivers and canals that fed into the Grand Canal network. Many of these 2,000 or more commercial cities also became important collection points of tax grain as well as grain and other food products for regional and nationwide distribution. They also became important distribution centers for light industrial goods, such as porcelain, cotton textiles, lacquerware, and silk.

An important innovation during the Song period was the increased use of money. The use of money in the form of copper coins and later silver greatly accelerated trade within China and led to the development of credit. Another

important related development in the advance of the Song was the establishment of the world's first government-issued paper-printed money. The growth of a money rather than a barter economy facilitated trade and greatly encouraged the expansion of commerce and the growing reputation of commercial cities as major centers of finance.

A further innovation was the rapid growth in foreign trade. Chinese goods were traded as far away as Africa and the Middle East, and China's commercial cities, especially those along the Yangzi and coastal areas, became areas of major mercantile activities and services as well as the home or base of a great number of foreign traders and merchants. Guangzhou, with its prime location on the Pearl River near what is now Hong Kong Harbor, grew at a very rapid pace into one of the major commercial hubs for Chinese foreign trade, especially with Southeast Asia.

Commercial cities thenceforth became the centers of Chinese economic, social, and political life. To be sure, until the early twentieth century, China remained a country of villages that contained 75 percent of the population, but commercial cities remained as critically important centers from the Song era onward.

China's Tea and Horse Trade

Although the Chinese bred horses for government and military use, the Ming, like most dynasties, could not breed sufficient numbers of high-quality horses for military purposes. Although the Great Wall could deter or slow attacks from the steppe, ultimately only cavalry could oppose the Mongols in the field. The Chinese did gain some horses through tribute, but their numbers were not sufficient for their needs.

A larger part of the problem was that a fixed quota of horses did not exist in the Ming court's tribute agreement with the various Mongol tribes, Tibetans, and Turks on its northern and northwestern borders. Tribute amounts varied, and the terms were negotiated virtually every year. For example, if the Mongol side was deemed stronger, the Ming conceded to its terms and often gave more for less, whereas if the Ming held the position of strength, the empire could dictate the terms. Regardless of who had the upper hand, some negotiation and haggling occurred behind the scenes.

As a result of the irregular flow of horses, the Ming followed the example of numerous dynasties before them by seeking to trade Chinese goods for horses with such Inner Asian powers as the Mongols, Oirats, Tibetans, and Turks. Although silk and other luxury goods remained in demand, another item became a key product for the horse trade: tea.

Although tea was not a native steppe drink or one that traditionally the nomads drank on a regular basis in earlier times, and hence one reason why Marco Polo did not mention it in his travels, nomads slowly acquired a taste for tea, which they drank usually with a liberal dose of milk and butter. The transition to tea among the various trading partners occurred for a variety of reasons. A simple fact was that tea is a hot and stimulating drink and was welcomed in the cold climates of the steppes and highlands of Inner Asia. In addition, it stayed fresh for a long period. While kumiss (qumiz), fermented mare's milk, remained the favored drink of the steppe nomads, it generally is only available in the spring and summer months. Another reason for tea's popularity was that boiling water to brew the tea removed many of the pathogens found in the water sources of the steppe.

As the Ming emperors held a complete monopoly on tea production and trade, they easily shifted some of it to the steppe. The government also devised theories to rationalize the trade. The most obvious reason was that trading tea for horses was significantly cheaper than trading silk and finished products. Yet this was not a sufficient reason. While there is no proof that their hypothesis was correct, many in the bureaucracy believed that drinking tea made the Mongols

➤ MONGOLIAN HORSE

(Timothy May)

These tough Mongolian horses, which the Ming sought to acquire, have not changed significantly over the centuries. They are small, almost ponylike in size, but are known for their incredible endurance. The short mane and the long tail of the horse makes the Mongolian horse quite distinctive. On the hindquarters of the horse in the foreground is the *tamga*, or brand, of the horse's owner. In the background is a *ger* (known to Turkic speakers as a *yurt*), the felt home of a typical Mongol nomad and still in use today. Behind it is a *tuq*, or battle standard, that looks like a cross with horse tails hanging from it.

—Timothy May

and other steppe peoples more docile and thus less likely to raid borderlands. The Mongols and other border peoples who drank tea probably experienced no radical physiological or psychological changes that made them less bellicose, but strangely this idea held some truth. As long as the nomads received their tea, they had no reason to raid in order to acquire it.

An official agency, the Horse Trading Office, was created in Shaanxi Province and was the only legal authority that could trade tea for horses. Its operations began in 1375 and met with great success, particularly in the early years of the Ming dynasty. Eventually four branches opened to deal not only with the Mongols but also with

the trading cities farther west in Central Asia, such as Hami and Kashgar. Despite the monopoly, a thriving smuggling trade also existed on the frontier. In the fifteenth century, the government assented to relinquishing its monopoly on the tea trade to Chinese merchants. Although the monopoly ended, the Ming still profited through tariffs of up to 50 percent on the tea trade.

Unfortunately for the Ming, tea did not make the Mongols docile herders. In the mid-1400s, increased Mongol raids on the northern frontiers disrupted the trade. By 1500, the political instability of central Asia resulted in the rise of a number of powers, including the Oirats, hostile to Ming interests, and the Ming found themselves without any trading partners. Thus, entering the sixteenth and seventeenth centuries, the Ming were again a kingdom without a horse.

Markets beyond China

The Afro-Eurasian world economy welcomed another one of its revolutions beginning around the tenth century, and this one turned out to lay down the foundations for a continuous expansion across different cultures.

In China, the founding of the Song dynasty in 960 was accompanied by a gradual shift of the economic center from the Yellow River valley in the north to the Yangzi River valley in the south. This shift was accelerated as invading nomads—the Khitan (Qidan), the Jurchen (Ruzhen), and then the Mongols—set in motion a continuous migration toward the south. The more fertile southern lands, sufficient water supplies, new crops, and longer growing seasons prompted an economic revolution. In addition to the traditional land routes that connected China

and the markets beyond, known collectively as the Silk Road, a thriving economy and easier access to southern ports allowed the Chinese to expand the reach of their trade and to integrate themselves into already long-established sea routes that brought them into the ports of southern Asia and eastern Africa.

Earlier, other merchant mariners—Arabs, the Indians, Malays, and many others from the waters of the Indian Ocean and its adjacent seas—had frequented southern Chinese ports. But now China, especially during the age of the Southern Song (1127–1279), became a major maritime trading entity and a full partner in an Afro-Eurasian economic revolution at sea. A new instrument, the needle compass, made available to navigators was crucial in this revolution. Shipping also became less dangerous because of advances in shipbuilding technology.

The Chinese port cities of Guangzhou, Quanzhou, Hangzhou, and Shanghai emerged as commercial hubs of a widespread trade network across Afro-Eurasia. Of these ports, Quanzhou was particularly prosperous. The Southern Song government appointed a local governor who concurrently held the position of the chief of seafaring affairs to oversee foreign trade. His job was to welcome all foreign traders as guests, attend to their needs, provide information about the favorable winds and tides, and perform rituals to invite the goddess Mazu to protect all of those at sea. He was also responsible for registering Chinese merchants who were to depart from Quanzhou bound for the deep blue sea.

Ships departing from Quanzhou and other Chinese ports were junks. A junk was a flat-bottomed ship with internal sealed bulkheads and stern-mounted rudders and came with multiple watertight compartments to increase its stability and safety. A large junk contained as many as four decks, six masts, and a dozen sails and could carry up to 500 men. It was indeed the best ship in the world at that time. Those who sailed on the junks went south first to Srivijaya (or Java) in the Malay Archipelago; from there they navigated their way through the Strait of Melaka (Malacca), a choking point between the South China Sea and the Indian Ocean. One of the destinations for Chinese seafaring merchants was Quilon (Kollam), on the Malabar Coast of

➤ CHINESE CERAMIC WARES IN AFRICA

Ever since the rise of the Arab empire in the seventh century, societies across the Indian Ocean were connected by a network of maritime trade routes through which a large variety of commodities were shipped from one end of Afro-Eurasia to another. As oceanic cross-cultural trade expanded, the Arabs perhaps were the first to carry Chinese ceramic wares to Africa. The export of Chinese ceramics to Africa picked up momentum during the Yuan dynasty (1279–1368), climaxed during the Ming (1368–1644) when Zheng He sailed to the African coast in the early fifteenth century, and continued through the Qing (1644–1911). Recently, Chinese ceramic wares have been discovered in more than 200 sites in seven African countries, mostly along the east coast, such as in Kenya, Tanzania, and Ethiopia. Many of these ceramic wares were then exported from the coast to the interior of Africa and to northern Madagascar. Among these were included the world-famous porcelains of Jingdezhen.

—Yi Li

southwestern India. The fourteenth-century Arab world traveler Ibn Battuta witnessed the thriving community of Chinese merchants in the Malabar Coast, who obviously participated in, if not dominated, the cross-cultural trade on that side of the Indian Ocean. While Arab merchants had a much better command of trade on the other side of the Indian Ocean, some Chinese merchants also ventured into markets as far as East Africa.

Quilon was undoubtedly one of the most important commercial hubs in the world at that time. Peoples from all over the world gathered there, attracted mostly by the profit of trade. Ancient Romans and Phoenicians had left their marks there, and Arab merchants constituted the largest constituency in Quilon's foreign community. Chinese junks bound to Quilon usually filled their cargos with tea, silk, and porcelain, which were the most sought-after commodities in foreign markets. Along the way they picked up passengers and commodities from East Asian markets. From Quilon, Chinese goods were further distributed across other parts of Afro-Eurasia:

western Asia, Europe, and the East African coast. From Quilon, Chinese junks would bring home spices, perfumes, textiles, and even animals from tropical countries.

While the early-thirteenth-century Mongol conquests across Eurasia might have been responsible for a temporary interruption of the network of caravan trade routes that stretched across the heart of Central Asia, the impact on the sea routes was far less violent and substantial from the start. Moreover, trade between China and the world beyond continued to expand in the wake of the Mongol conquest of the Middle Kingdom (which was completed in 1279) and climaxed in the seven great voyages commanded by Zheng He in the early fifteenth century. A close look reveals that Zheng, in his maritime voyages, roughly followed the existing sea routes that the merchants from China, India, Arabia, and many other places had been using for many centuries. The trade between China and the world beyond was an ever-continuous venue of premodern cross-cultural exchanges.

Chinese Merchants in the Song Era

China's Song era (960–1279)—particularly the Southern Song era (1127–1279)—gave rise to a new merchant class that had an impact not only on the Middle Kingdom's long-standing system of social stratification, but also on its domestic prosperity and level of foreign trade. This evolution of the merchant's role in society continued throughout the period of the Yuan dynasty

(1279–1368), as a consequence of the continued success of overseas trade, and flourished conspicuously in the Ming era (1368–1644), during which there was a growing recognition of the merchant's value in the increasingly interdependent mercantile communities that flourished at home and abroad.

China's central government had often sought to manipulate or contain the growth of trade in the centuries preceding the Song dynasty, due to a worldview that portrayed the work of merchants as parasitic on society and of low moral value. Traditional Confucian ideology placed scholarly government officials (*shi*) at the top of the four basic social classes, organized by profession. The farmers (*nong*) and craftsmen and artisans (*gong*) followed in descending order because of their contributions to the sustenance of the populace and provision of needed goods. Merchants and traders (*shang*) fell into the lowest stratum, as early philosophers held that this class did not contribute any real good, profiting only by trading and selling the products of others' labor.

In China as well as other societies, theory and reality often diverge. Whether a merchant family accepted the Confucian classification principles or not, money provided a means of moving to the top of the social ladder. In order to compete in the provincial and empire-wide examinations for entry into government offices, one had to have years of training and education, requiring time and resources that were not easily had by all. Increasingly, the ranks of successful examination-takers were being swollen by the sons of wealthy merchants and even, in some cases, by former merchants. Indeed, the opportunities made available by China's growing commercial economy provided even small traders and poor laborers from rural areas a chance at wealth and social mobility.

Numerous factors were instrumental in the developing wealth and power of the merchant class. Advances in rice technology in the tenth century allowed for larger-scale rice production, which increased not only the relevance of the southern regions in commerce, but population expansion as well. The population boom provided an abundance of cheap labor for the pro-

duction of goods. An estimated 31,000 miles (50,000 kilometers) of waterways, rivers, and canals contributed substantially to an ease of domestic trade. The Grand Canal, which had been employed since the Sui era (589–618) as a major route for indigenous trade ships, especially ships transporting grain and other foodstuffs, was a notable example of how the Chinese controlled water for commercial advantage. The Canal was used not only as a trade route for centuries preceding the Song, it was further developed in this era as a means of defense. As a consequence, the Grand Canal south of the Yangzi River was severely damaged in 1128 due to efforts to impede the advance of invading Jurchens (Ruzhens) of the Jin empire, and it was further used as a defensive system when the Southern Song faced (and ultimately succumbed to) the Mongol invasion. Upon their conquest of China, the Mongols expanded the canal system northward to their newly established capital of Dadu (Beijing). The southern Grand Canal was fully restored for use by the Ming dynasty, providing merchants an efficient means of shipment from Beijing to Hangzhou, a distance of 1,103 miles (1,176 kilometers).

As for foreign trade, the advancement of naval technology by Southern Song shipwrights produced the most innovative seagoing vessels of their time—complete with multiple decks and the ability to transport several hundred sailors. Consequently, China enjoyed a burgeoning overseas commerce that took its merchant sailors from Japan to East Africa. Additionally, eased governmental restrictions on trade in this era enabled merchants to augment their profits, as well as to pay trade and import taxes that became a major source of government revenue.

Merchants in the Song era became more sophisticated and specialized in their business techniques. Joint-stock companies were established to allow several investors to participate in trade ventures. This enabled multiple merchants to profit from successful overseas shipments, as well as providing effective risk management in case of loss. The increased use of paper money circulated by the government simplified large transactions, and the availability of credit and financiers willing to provide it afforded smaller merchants and producers of every sort and scale an op-

➤ HUIZHOU MERCHANTS

The enterprise and skill of merchants hailing from the Huizhou region in the Pearl River Delta demonstrated the prominence that the merchant class was able to achieve through effort and ingenuity in the Ming dynasty (1368–1644). It is believed that the advancement of the Huizhou merchant class began to develop in the Southern Song era (1127–1279) and progressed steadily for several centuries, illustrating the power and sophistication that well-trained and respected merchants came to possess by the Ming era.

Huizhou merchants became involved in commerce due in part to a lack of agricultural work available in the area. Parents sent their 12- and 13-year-old sons into town to study a craft under apprenticeships, and it was widely reputed that native Huizhou sons were conducting their own business throughout the empire by the age of 17. By the beginning of the Southern Song dynasty, it was said that Huizhou merchants had a hand in all manner of trade, from tea, wood, salt, and other local goods to services rendered as pawnbrokers. Many Huizhou entrepreneurs left the region for years at a time to make their fortunes as far away as Thailand and Japan and brought wealth and prestige back to their hometowns. The power and affluence enjoyed by these merchants enabled them to sponsor academies and examination halls and educate their own sons for entry into governmental offices. Not only did this ingratiate them with powerful administrators who provided political advantages in business, but by the Ming era it increased the numbers of officials who came from merchant families. Although this assimilation was illustrative of the merchant's upward mobility, the continued aspiration of the merchant family to attain scholar-official status represented, to some extent, its acquiescence to enduring class subordination.

—Jennifer Lei

portunity to enter China's domestic and foreign markets.

Indeed, an abundance in the production of goods necessitated the organization of guilds that specialized in certain products such as tea, paper, wine, salt, porcelain, and textiles. The heads

of guilds facilitated placement for those seeking work, as well as those who were hiring, and often served the government by enforcing restrictions and assessing taxes.

Not only did Southern Song's home markets flourish, overseas trade now surpassed overland trade across eastern and central Asia's caravan routes for the first time in China's long history, and it continued at this pace in the era that immediately followed. After the Song dynasty's fall to the Mongols in 1279, the succeeding Yuan dynasty maintained these international economic networks of trade, which only began to be reduced after the 1430s during the early Ming era.

Although overseas commerce leveled off and fell during the fifteenth century, the same was not true for domestic commerce and the fortunes of China's merchant class. The first Ming emperor, Hongwu (r. 1368–1398), despised the merchant class and attempted to dismantle its influence through massive taxation and forced relocation, but his efforts were ultimately fruitless when the restrictions failed to hold with subsequent rulers. In fact, the merchant class enjoyed greater social respect than ever before during the Ming era. Government officials had already recognized the importance of the revenue generated by trade taxes, and became increasingly dependent on the merchant class's participation in funding government projects. The government became more dependent on merchant expertise in the workings of the market, breaking up state monopolies—such as highly regulated salt production—in favor of privatization. In addition, even in times of diminishing overseas trade, the revitalized canal system allowed for continued domestic trade and merchant prosperity. Wealthy merchants were called

upon for contributions in times of natural crises, and were regarded highly for their sponsorship of public projects beneficial to the empire's infrastructure, including the building of schools and provision of books necessary to sustain the nation's examination system. In turn, the merchant class now enjoyed a higher and better social standing as *merchants*, a result of their previously disdained wealth and power.

The role of merchants from the Song through Ming dynasties represented a dichotomy in the cultural national ideology. Whereas the widely accepted tenets of Confucian social classification strove to undermine the role of traders, their commerce was essential to the health of China's economy. The work of merchants in this era was fundamental to China's flourishing domestic wealth and established its global position as an economic leader. In the early fourteenth century, Marco Polo commented on the wealth of Chinese harbor cities and the abundance and vigor of their trade ships. The efforts of these Chinese merchants represented the beginning of a commercial revolution that, despite its later decline, greatly influenced first Afro-Eurasian and later global trade.

■ Introduction: Europe's Economic Revolution

In many respects, Europe was far behind most of the urbanized areas of Asia when it came to economic development during these five centuries, and Europeans were well aware of that disparity. An anonymous member of Vasco da Gama's crew that sailed from Portugal

to Kozhikode (Calicut) on India's Malabar Coast wrote in wonder of the vast wealth to be gained through direct access to the spice trade of the East. According to him, the Mamluk sultan of Egypt enjoyed an annual revenue of 600,000 *cruzados*, or gold coins, from duties imposed on

the spices transshipped from the East, up the Red Sea to Egypt, and beyond to European emporia. The maritime cities of Venice and Genoa also made handsome profits in their capacity as middle agents of this trade, and other Europeans, especially the Portuguese and Spaniards, were eager to tap directly into this lucrative trade.

The quest for direct access to the “Indies” drove the travels of da Gama, Columbus, and those who followed, but such a thirst would not have been possible except for two phenomena. Europeans had initially acquired a taste for direct access to the Indian Ocean and China during the *Pax Mongolica*. Moreover, from the early eleventh century until at least the early fourteenth century, Western Europe had undergone its own economic revolution, although its economy paled in comparison to that of China and the overall Islamic world.

The following entries can give only a taste of the parameters of that revolution. During these roughly three centuries, European banking, especially as created within the commercial cities of Italy, grew at a rapid pace from essentially nothing to a system in which banking houses, such as the Bardi of Florence, had subsidiary banking concerns far beyond their places of origin. Rich merchant-bankers in both Italy and the north, especially France and the Low Countries, became financiers to kings, but there was always the real possibility and reality of ruin when monarchs defaulted on their loans.

Well before the crusades gave a boost to overseas trade, the Italian maritime cities of Pisa, Genoa, and Venice as well as other Mediterranean cities enjoyed profitable trade relations with the Byzantine and Islamic ports that ringed the eastern and southern Mediterranean. Once the crusades offered these Western merchant cities direct entry into the Levant by providing them with their own self-governing quarters in the port cities of the crusader states, trade and profits multiplied many times over. During the thirteenth century, first Venice and then Genoa gained access to the port facilities of the Black Sea, the gateway to central Asia.

With the *Pax Mongolica*, a handful of Italian merchant-adventurers established houses in China, and around 1340 a Florentine bean counter, Francesco Balducci Pegolotti, found it worth-

while to compile *The Practice of Commerce*, a book of useful information for European merchants traveling to the land of the Great Khan, a sort of “On the Road to Cathay for Dummies.”

With the mid-fourteenth-century Great Eurasian Pandemic, the dissolution of the Mongol empire, devastations wrought by the armies of Amir Timur-i Leng (Tamerlane), and the rise of the Ottoman empire, direct access to China was severed. But although European commercial activity underwent retrenchment due to the gross depopulation occasioned by the so-called Black Death and other disasters of the fourteenth and fifteenth centuries, European merchants and bankers (and usually they were one and the same) proved resilient and resourceful. The pruning that took place allowed for the rise of the innovative and bold, such as the Medici of Florence. By 1500, rich merchant-bankers were generous patrons of the arts that were flourishing in Italy and lands north of the Alps, especially in Flanders and other regions of the Low Countries.

Although far less romantic and profitable than the exotica imported from the East, trade in home-produced staples, such as timber, wool, furs, and grains, was booming, at least until the mid-fourteenth century, thanks to the inland waterway system of northern Europe that allowed for relatively fast and inexpensive movement of such high-bulk, low-profit items. And most of this trade was for home consumption. By 1200, the level of internal trade from the Atlantic to Poland might well have exceeded that of the entire Roman empire of the second century CE.

During these centuries European industry never reached the scale that it did in Song China, but the textile weavers of Europe, especially those of the Low Countries, France, and Italy, contributed to the overall economic health of Europe, even as so many of them were terribly exploited by the entrepreneurs who employed their labor.

Europe suffered an economic depression due to the crises of the fourteenth century when the Four Horsemen of the Apocalypse—Plague, War, Famine, and Death—rode with abandon. But Europe's overall economic structures were sound enough and its entrepreneurs confident enough for recovery to have begun before 1500. Of course, the great sixteenth-century influx of

silver and gold (especially silver) also helped in that recovery, although it caused its own problems, mainly massive inflation. But that is a story for another period of world history.

—*Alfred J. Andrea*

The Fairs of Northern Europe

Trade fairs that emerged in the northern parts of Europe in the eleventh century ultimately became an early major component of Latin Europe's economic development during its so-called High Middle Ages, but by the mid-thirteenth century they had been superseded in economic importance by more fixed establishments, such as Italian banking houses. Regardless, they continued to exist, assuming increasing social and recreational purposes, and a number of modern European fairs can rightfully trace their origins back to those medieval entities. Unlike regional and town markets that occurred on a regular basis throughout the year in a single location, Europe's medieval fairs were moveable institutions, lasting anywhere from several days to several weeks, that followed fixed schedules as they trav-

eled from place to place, allowing buyers, sellers, and financiers an opportunity to congregate and conduct their business. As populations grew in the region from France to southern Scandinavia, people wished to sell surplus products and obtain goods that were not available locally. While several fairs could trace their origins to the Roman empire, Latin Europe's fairs were largely a new phenomenon that came into being to meet the basic commercial needs of a developing society and eventually evolved into early centers of European international trade.

The earliest fairs revolved around religious celebrations at locations such as monasteries and churches. Such fairs included the fair of St. Denis, held midpoint between the abbey of St. Denis and neighboring Paris and presided over by the abbey's monks, who obtained royal authorization from Louis VI (r. 1108–1137) for the fair to begin on the second Wednesday of June and run through St. John's Eve (June 23). The monks of St. Denis claimed, perhaps correctly, that their fairs originated in the early seventh century.

Whatever their origins, as fairs developed it became apparent that landlords could profit from

► CHAMPAGNE

The then semiautonomous province of Champagne hosted one of the most important network of fairs in northern Europe during the high medieval period. Taking advantage of the traditional trade routes that connected the Mediterranean core of the Roman empire to the trans-Alpine north, the counts of Champagne sponsored six fairs throughout the year in the towns of Lagny, Bar-sur-Aube, Troyes, and Provins. The earliest known record, dated to 1114, notes that they revolved around the moveable religious observances of Lent and the Ascension and the fixed feasts of St. John's Day (June 24) and All Saints' Day (November 1).

Although the autonomous actions of Champagne's counts and the province's agricultural output served as an important impetus for the origin of the fairs, there were two external factors responsible for their transregional importance. First, throughout most of the twelfth century, cloth producers in northern Europe would travel

to Italy with their textiles. By 1190, however, Italian merchants began traveling northward. Second, King Philip II (r. 1180–1223) guaranteed protection to all traveling merchants with an additional promise to allow merchants three months to leave France should his guarantee be revoked.

Although cloth was the most important commodity involved, during the Champagne fairs' peak in the thirteenth century, merchants from Italy, England, Spain, the Germanic Territories, and France sold goods ranging from exotic items, such as spices, lacquer, and dye woods, to staples, such as grain, wine, and horses. By 1320 Champagne lost its international importance partly due to a downturn in the commercial economy and the military campaigns of King Philip IV (r. 1285–1314). The primary reason, however, was the increase of maritime trade directly between the important ports of the Low Countries and Italy.

—*Jonathan H. L'Hommedieu*

imposing taxes, tolls, and tariffs on the land on which fairs were held and on the roads leading to them. Between roughly the twelfth and the fifteenth centuries, networks of strategically located fairs developed throughout Flanders, France, England, the Germanic territories, and Scandinavia. The Flemish towns of Ypres, Lille, Mesen, Torhout, and Bruges represented one of the earliest of such twelfth-century fair networks. Merchants at such fairs focused on selling a variety of local items and purchasing goods, such as English wool, chalk, and cumin. The most important Scandinavian fair at Scania revolved exclusively around the Hanseatic League's most important commodity, herring. The famous circuit of six fairs in Champagne of significance in the twelfth and thirteenth centuries was a notable exception, as they truly had global implications for trade.

As the resources or the technological requirements to establish permanent trade centers were initially absent in northern Europe, fairs were an essential component of regional and local economic development. During the first half of the thirteenth century, the primary valuable commodities produced in the north were wool and cloths, in demand for distribution in the Mediterranean world. The Italian merchants responsible for initiating this trade brought in exchange spices, silk, perfumes, dyes, and gold to the region. The disparity in value between what Italian and northern merchants brought to fairs resulted in the phenomenon whereby large quantities of gold, silver, and currencies would be exchanged. To cope with this, an early system of credit known as *lettres de foire* (fair letters) was established. This often led to letters being paid at fairs in other locations at a later date. Although fairs began to lose their importance in commercial trade by the thirteenth century, they continued to serve an important function as a payment clearinghouse for north-south trade.

The decline of fairs can generally be attributed to the natural economic development of the later medieval period. As political power centralized, new taxes placed on fairs reduced their attractiveness to merchants from afar. New trade routes also allowed merchants to travel directly to cities that had become permanent trading centers in coastal areas, bypassing the formerly

natural location of fairs along traditional trade networks. This process began in the fourteenth century as the French fairs' primacy was undermined by Italian merchants beginning to travel directly to the coastal fairs of London, Bruges, and Antwerp. Although by 1500 major permanent commercial hubs superseded the importance of fairs in northern Europe, they continued to exist in peripheral areas of central and eastern Europe.

Italy and the European Commercial Revolution

Between the middle of the eleventh and the early fourteenth centuries, Europe underwent an economic revolution comparable in significance, if not in scale, to the Industrial Revolution of the late eighteenth century. Led by the city-states of northern Italy, this revolution fundamentally altered the way Europeans did business by developing new techniques and creating new institutions to facilitate long-distance commerce. More profoundly, this commercial revolution helped forge a distinctive mercantile culture in northern Italy and in so doing paved the way for far-reaching changes in the realms of politics, social theory, religion, and culture of feudal Europe.

Largely because of its geography, it was Venice that took the lead in this commercial revival.

► THE HOUSE OF THE BARDI

Founded in 1267, the House of Bardi was the largest of what has been dubbed the medieval supercompanies. Along with two other Florentine companies, the Peruzzi and the Acciaiuoli, these supercompanies were characterized not just by their size but also by the volume of their trade and their ability to keep their capital productively employed.

The success of the Bardi hinged upon providing Florence with two vital commodities, grain and wool. With the Florentine countryside increasingly unable to feed the city by the late thirteenth century, the Bardi filled this need by importing grain from southern Italy. Similarly, the Bardi were instrumental in helping transform the Florentine cloth industry into a high-value luxury trade by furnishing it with the best raw material of the day, English wool.

Although the core of their operation was centered on commodity trading, the Bardi quickly diversified into insurance and banking, handling financial transfers for the papacy and becoming the principal bankers to the English Crown by the late 1320s. With the virtue of hindsight, the Florentine chronicler Giovanni Villani described this policy as foolish. According to Villani, Edward II owed the Bardi some 900,000 florins when it failed in 1346. Although the Bardi's involvement in Florentine politics must not be discounted as a factor in its collapse, Villani noted that the effects of the failure and that of the other two supercompanies in the same decade were such that "hardly any substance was left amongst our citizens."

—Richard Raiswell

Founded in a malarial swamp with no arable land upon which to grow crops, from its earliest days Venice needed to import food to survive. With land at a premium, successful merchants had little choice but to reinvest their profits in commerce. Consequently, trade became the city's lifeblood. Although Venetian trade extended throughout the eastern Mediterranean, the key to the city's prosperity lay in its close ties to Constantinople, which served as the western terminus to a series of trade routes from the East. Here Venetians could buy all sorts of ex-

ceptionally valuable Asian commodities, particularly silks and spices, that they reexported at a considerable profit into the heart of Europe.

Toward the end of the eleventh century, Venice's commercial hegemony was challenged by Pisa and Genoa. Both of these states had initially taken to the seas to repel Muslim pirates, but by 1088 they were venturing into Muslim North Africa. Along with Venice, the position of these states was consolidated in the ensuing decades by the crusades. In exchange for transporting men and material to the Levant, these city-states were granted a host of commercial rights and were permitted to set up their own trading colonies in the coastal cities captured by the crusaders. With demand mounting for expensive Eastern luxury goods in northern Europe, some progressive nobles tried to encourage trade within the lands they ruled by establishing regular and protected fairs at which Italian merchants could sell or trade their wares. From the beginning of the twelfth century, the chief of these fairs were sponsored by the counts of Champagne.

Because the Asian commodities that the Italians sought were expensive and the voyages they undertook were dangerous, this trade required new and practical methods of financing. In this respect, the most important innovation was the *commenda* contract. Under a *commenda*, an investor (*commendator*) would supply capital to a traveling partner (*tractator*), who would purchase goods abroad. Upon his return, the *tractator* would receive a quarter of any profits, the balance going to the *commendator*. In the early stages of the commercial revolution, the *commenda* had a series of distinct advantages. First, it facilitated the entry into commerce of capable young men who had no capital of their own, allowing them in effect to apprentice in the trade. Second, because *commenda* contracts usually did not specify where the *tractator* should trade, he could take advantage of regional fluctuations in supply and demand, thereby maximizing the profits for both parties. Third, as the *tractator* could secure investments from a number of different *commendatores*, each individual investment could be quite small. Consequently, a significant proportion of the population of these Italian states was invested in trade, and this be-

came reflected by the establishment of merchant oligarchies in these city-states. Finally, because the returns on the investment were uncertain, it gave merchants a way around the Church's prohibition of usury, or lending money at interest. This ensured that merchants construed their returns as licit and that they would leave their fortunes to their heirs rather than hand them over to the Church to atone for usurious practices.

By the thirteenth century the *commenda* contract was passing out of favor. With competition stiffening and profits declining, merchants needed to rationalize their trading practices. In this climate, many larger merchant confederations began to employ permanent salaried factors, or agents, in the regions where they most often did business. While this eliminated much of the uncertainty of ventures under *commenda* contracts, it tended to fix trade along regular routes and between particular centers, eliminating the ability of agents to take advantage of regional price differences and signaling the end of the Champagne fairs.

The development of the factor system dramatically changed merchant culture. With factors scattered across Europe, the eastern Mediterranean, and into the Black Sea, merchants needed to have regular and detailed information about the price and supply of different commodities. As a result, the thirteenth century saw an explosion in the volume of mercantile correspondence. Moreover, with trade now conceived as a continuous rather than per-venture occupation, it was important for a merchant and his factors to keep running accounts so that they might know who owed what to whom and when. Furthermore, many merchant companies began to compile handbooks for their factors that contained information about how to distinguish the quality of various desirable commodities and described the weights under which they were sold. Other manuals included information about trade routes, local customs, taxes, and currency. All of this meant that it was increasingly necessary for merchants and factors to have a practical, secular education that stressed basic numeracy and vernacular literacy.

By the end of the thirteenth century, the age of rapid fortunes won on the frontiers of commerce was truly over. Trade had become fixed

➤ A FACTOR OF THE HOUSE OF BARDI DESCRIBES COMMERCE IN CHINA

Around 1340, Francesco Pegolotti, an agent who had served the Bardi banking house at posts from London to Cyprus, composed *The Practice of Commerce*. In addition to its lists of facts and figures, it included a short essay of advice for merchants bound for Mongol-dominated China. Although Pegolotti himself had not traveled that far east, his information, based on the accounts of others who had done business there, was quite good. In this excerpt he describes the use of imperial paper money, a practice that had begun under the Song dynasty in the 1120s and was continued by the Mongols.

"Whatever silver the merchants may carry with them as far as Cathay the lord of Cathay will take from them and put into his treasury. And to merchants who thus bring silver they give that paper money of theirs in exchange. . . . And . . . with this money you can readily buy silk and all other merchandise. . . . And all the people of the country are bound to receive it. And yet you shall not pay a higher price for your goods because your money is of paper."

along particular routes; success depended upon economies of scale and rate of turnover. In the early fourteenth century, though, Europe's economy was rocked by a series of devastating economic and demographic crises that ushered in the economic depression upon which the European Renaissance was founded.

Latin Europe's Textile Industry

Latin Europe's medieval industrial revolution began as early as the ninth century, as the production, finishing, and dyeing of cloth gradually moved out of the realm of the home to become a specialized industry. While the cloth trade was initially conducted in outdoor fairs, late in the tenth century northern cities in Flanders set up more permanent places of trade, with indoor cloth halls in Bruges, Ghent, and Ypres.

Textile guilds appeared as early as 925 in Germany and paved the way for a labor system that would dominate the rest of the period. The

medieval guild was an organization that was developed to protect the rights of its members and to regulate prices of raw materials and finished products. The guild regulated the number of workers allowed in each trade and provided an apprenticeship system for new recruits. However, although the guilds served as a powerful protective organization for many artisans, some, such as dyers, and in some regions, tailors, were excluded to suffer a more difficult path.

Overall, the importance of the textile industry in northern Europe cannot be underestimated. It is probable that approximately half of the population in the textile centers such as Bruges, Ghent, and Ypres was employed in the business. The merchants in the north were responsible for importing wool from England, shipping it across the channel to Bruges, where it was woven and dyed. Each merchant supplied wool to workers, who sorted it and washed it to remove the lanolin. After it was dried, women carded it and spun the fiber into yarn.

One of the important issues to consider in the study of textiles in the medieval period was the change in the organization and division of labor between the sexes. In the early Middle Ages, women performed all of the tasks relating to making cloth—shearing, cleaning the fibers, spinning, weaving, dyeing, and finishing. By 1300, men had taken over the weaving and dyeing, while women continued to do the preparatory tasks for weaving. Historians have attributed this change to several factors. As manorial ties waned, which were the basis of organization in the early medieval period, peasants had more freedom to move around geographically and seek better lifestyles. This increased the population in towns, where men who previously worked the land were forced to find new occupations. The towns became concentrated centers of industry, and organizations such as the guild structure provided support for men to prosper in their trades, while excluding women from this practice. In addition, capital for large industry was required with the advent of technological advances. Large looms and water mills were not within the reach of a woman with a small cottage industry run in her home. Women did, however, continue to weave. Some women wove cloth in the home for

▶ EUROPE'S SILK INDUSTRY

During the eighth and ninth centuries, *sericulture*, the cultivation of silkworms, was introduced by Arab artisans and tradesmen into Spain and Sicily. In 1147, King Roger II, Norman king of Sicily (r. 1130–1154), imported Greek and Jewish silk weavers into his kingdom, which included southern Italy, as well as Sicily. Their descendants were responsible for the spread of sericulture throughout the Italian Peninsula. Under Emperor Frederick II (r. 1215–1250), who was also king of Sicily (r. 1197–1250), dyeing was controlled mainly by Jewish immigrants, as was silk weaving. Foreign influence can likewise be attributed to the development of Levantine forms of brocaded silk and velvet weaving in Italy. Although sericulture and silk weaving were, by far, the most developed in Italy, the lucrative industry spread to other countries, including Portugal and France. In 1147, the first mulberry trees, essential for feeding silkworms, were transported from Syria to be planted in France. With the so-called Pax Mongolica (ca. 1260–1368), silk production techniques from India and China also made their way to Italy.

—Marie Botkin

their own use, but the majority of women who were involved in the weaving process were connected in some way to a man that was protected by the guild system.

In the late twelfth century, Italy began to compete with the northern cloth centers in Flanders. While they could not compete with the quality of wool that was available in England, many Italian cities got around this by importing unfinished cloth and dyeing it themselves at great profit. The guild system in Italy also developed and formed a powerful establishment. In Florence, there were twenty-one guilds, seven of which were called the "Greater Guilds." Three of these important guilds were related to the textile industry: the cloth finishers, the silk merchants, and the woolen merchants. The guilds had great benefits for their members and wielded a lot of political power as well. Men with any political aspirations in medieval Florence were inclined to join one of the guilds to gain support.

The Inland Waterway System of Europe

The inland waterway system of Europe consisting of various river systems, canals, and links to the Mediterranean, Baltic, and Black seas among other major bodies of water allowed Europeans to establish vital trade links throughout late antiquity and the centuries that followed. The emergence of economic centers, such as the Île de France, Lombardy, western Germany, and Flanders during the so-called High Middle Ages (ca. 1050–ca. 1350), was due to their fortuitous location on or near important waterways, contributing to the expansion of European commercial networks with linkages to Muscovy and the Is-

lamic World and indirectly to South and East Asia.

Rivers carried some of the trade in the late Roman empire, but the reliance on roads and maritime trade overshadowed that of internal waterways, and it was these army-constructed and maintained roads and Rome's Mediterranean fleets that occupied the attention of the empire's merchants, military officials, and politicians. The collapse of the Roman world in the West ended the dominance of these means of transport, at least so far as Europe was concerned. The emergence of Latin Christendom in the sixth and seventh centuries, in a more circumscribed world than that of the Romans, led to the development of commercial trade networks closer to home and established connections with the greater Mediterranean, Scandinavian, and Slavic worlds.

Navigable rivers and canals that the Romans had built became the initial primary means of transport for European merchants, but eventually they proved inadequate, leading feudal kingdoms, principalities, and other territorial political units to subsidize their expansion and construction of adjunct canals and facilities. Such improvements to infrastructure, in the form of canal building, the building of ports along river cities, and the dredging of shipping channels, led to considerable expansion of river-borne trade. Rivers such as the Seine, the Loire, the Rhine, the Danube, and the Rhone, along with their tributaries and canals, became pivotal links for intra-European trade and hubs for extra-European commercial expansion, connected as they were with vital seaports, such as Bruges, Venice, Genoa, and Marseilles.

The German cities of the Holy Roman Empire that were adjacent to navigable inland waterways were able to flourish economically due to the easy access to markets and trade hubs made accessible through them. In the thirteenth and fourteenth centuries, the Hanseatic League (also known as the Hansa), an association of northern German cities and German merchant settlements spread throughout Scandinavia and the Slavic realms to the east, dominated commerce from Flanders to the eastern Baltic Sea. This phenomenon was possible due to the commercial revolution that began in the twelfth century in much

THE RHINE RIVER

The Rhine River has proven to be a vital waterway to European trade, linking internal trade from Germany and France to external markets for centuries. Among the most pivotal inland waterways in Europe, the Rhine is navigable for nearly 500 miles (800 kilometers) inland from its mouth in the North Sea to Lake Constan­z (the Bodensee in German). The Rhine is linked directly and by canals to many of the other major rivers of Western Europe, such as the Moselle, the Meuse, and the Main, among many others. The development of the Rhine and its adjacent waterway networks is a continuous project whose origins extend back to various centuries. Its contributions to trade also resulted in political repercussions because it was the source of wealth for cities and regions that benefited from its proximity, and this often translated into political autonomy.

As part of the inland waterway system that was under development in Europe, particularly in the twelfth and thirteenth centuries, the Rhine offered a link between the commercial centers of west Germany and those of the Dutch and Flemish ports, which acted as further hubs of international trade. The economic and cultural significance of German member cities of the Hanseatic League, particularly Dortmund, Cologne, and Münster, is attributed to their geographical proximity to the Rhine, either directly or through access by a tributary or a canal. Immense amounts of river traffic due to the expansion of trade created the

Pfalzgrafenstein Castle, on the Rhine River in Germany, was built as a toll station for river traffic in the fourteenth century. (Allan T. Kohl/Art Images for College Teaching)

need for further canals to be cut through much of this period in adjacent regions to connect cities and their ports to the Rhine.

—Abraham O. Mendoza

of the northern Holy Roman Empire and the Low Countries (present-day Belgium and the Netherlands) and was directly linked to the access to trade given to these flourishing centers for commerce by efficient and affordable water transport along the expanding waterway system of the Rhine.

Christendom's Relics—Trade, Thievery, and Counterfeiting

Throughout the Middle Ages, Christian relics were bought, sold, stolen, given as gifts, broken into pieces, taken as plunder, and otherwise moved throughout the European and Mediterranean regions.

The Christian practice of venerating the remains of holy men and women emerged out of the religion's persecuted beginnings. Disciples of early martyrs would gather the remains of their departed fellows and employ them as focal points in the development of local churches. Similarly, objects closely associated with a saint could acquire sacred value to Christian commu-

nities. During the era of persecution, the cult of relics was a profoundly local phenomenon.

As normative Christianity developed in the late Roman era, items became more broadly recognized as relics. In this era, early Christian emperors sought to turn Constantinople into a true capital city of the Christianized Roman empire and to use religion as a means of inspiring cultural cohesion and loyalty. To this end, many Christian emperors extracted relics from the Holy Land and brought them in great numbers to their city. These included the relics of the Passion, Christendom's most sacred items. The great process of relic acquisition led to a much less august process, a pattern repeated in later eras (major relic translations leading to minor ones). Eastern prelates and rulers would take tiny fragments of key relics, encase them in beautiful reliquaries, and use them as diplomatic favors. In this way, Orthodox relics moved throughout the Christian world.

In the West, there had long been conflicts between religious houses over the authenticity and possession of relics. During the Carolingian period, the presence of newly empowered political entities with a unified religious culture spurred an increase in the perceived need to have relics that were at least as grand as those nearby. Clerics and secular allies of religious houses wanted prestige, spiritual patronage of a given saint, and the money that came with the pilgrim traffic. A commodification of relics gradually occurred in which relic traffickers traveled from Italy with relics that they had bought, stolen, or forged and sold them on the other side of the Alps. New literary traditions thrived as the result of the increased exchange and acquisition of relics via theft, pillage, and purchase. Recipients of new relics needed to document the authenticity of their possessions and legitimate their removal from their original homes; often, this required explaining how the relics had been acquired and recounting the miracles that accompanied their transfer. The point was that the saint whose relics were translated approved, and even directed, the transfer from a less worthy possessor to a more worthy one.

A resurgent papacy tried to take greater control over relics after the mid-eleventh century. Around 1140, the Italian lawyer-monk Gratian

➤ THE FOURTH LATERAN COUNCIL ON RELICS

In November 1215, Pope Innocent III summoned the leading clerics of the Latin Christian world (as well as several Eastern Christian church leaders) to Rome to participate in the Fourth Lateran Council, which dealt with high affairs of state and, more important, the intended spiritual reformation of Christian society. Each of the canons, or rules, issued was aimed at correcting a serious systemic problem as perceived by Innocent and his advisors.

Canon 62 addressed one such perceived abuse. It reads: "Because some expose for sale and exhibit recklessly the relics of saints, great injury is sustained by the Christian religion. . . . We ordain . . . that in the future old relics may not be exhibited outside of a vessel or exposed for sale. And no one may presume to venerate publicly new relics unless they have been approved by the Roman pontiff. In the future, bishops shall not permit those who enter their churches to venerate sacred relics to be deceived by worthless fabrications or false documents, as has been done in many places for the sake of profit." Ultimately, however, this effort was ineffective. In large part due to widespread dispersal of relics from Constantinople after the Fourth Crusade, relics of every sort and often doubtful authenticity remained alluring, powerful, and all too available (if expensive!). Chaucer's fictional fourteenth-century Pardoner, who had a pillowcase that he said was the veil of the Virgin Mary and a jar of pig's bones that he passed off as saints' bones, was an all too common reality.

—David Perry

Source

Papal Encyclicals Online, "Fourth Lateran Council: 1215," <http://www.papalencyclicals.net/Councils/ecum12-2.htm>.

ruled in his codification of canon law that it was not permitted to move a relic without permission from one's religious superior unless one did so in order to protect the relic or to find a more advantageous resting place for the saint. Translators of relics took full advantage of these loopholes. Innocent III (r. 1198–1216) tried to close the loopholes in the Fourth Lateran Council in 1215. That many later councils also enacted canons

Relic of part of the skull of Saint John the Baptist, decorated with gold and semiprecious stones. The inscription shows that the work is Bulgarian. (Werner Forman/Art Resource, NY)

forbidding the trafficking of relics serves as evidence that such prohibitions were ineffective.

Several factors contributed to the expansion of relic trafficking in the later medieval period. The crusades, the fading power of Byzantium, and increased travel from Western Europe to Eastern lands all allowed Catholics new access to old relics. Elites brought back prominent relics to benefit their own churches and reward their friends and allies. For example, Louis IX (r. 1226–1270) acquired the relics of the Passion from the Latin emperor of Constantinople in 1241 and built the Gothic masterpiece Sainte Chapelle to house them. St. Louis's acquisition, however, is merely the most famous example of a widespread practice. Furthermore, although common pilgrims, merchants, and crusaders lacked diplomatic channels, they could acquire relics through purchase, pillage, and theft. Many unscrupulous

vendors no doubt forged relics instead of stealing or buying better-attested sacred items.

In the long term, a type of relic inflation took place. Once many communities and religious houses had new relics pertaining to the Holy Family, the Apostles, or other important saints, rival sites tried to emulate their neighbors. The old local saints no longer functioned as sufficiently prestigious patrons. In such an atmosphere, relic trafficking thrived. Felix Fabbri, in his fifteenth-century pilgrimage guide to Jerusalem, warned pilgrims against buying the bodies of martyrs from locals, as they were merely the mummies smuggled out of Egypt. Others seeking relics bought them from vendors later lampooned by Chaucer's character, the Pardoner, in the *Canterbury Tales*.

Overall, although the relics moved throughout Christendom, it is not clear that foreign ideas or knowledge accompanied the objects. Instead, owners of relics from far away generally tried to make them their own. They developed new stories in which the saint acted locally to heal the sick or smite the unworthy. The vector of medieval relic exchange is clear: east to west and rarely, if ever, back again.

■ Introduction: Overcoming the Challenges of Geography

Geography and environment often present challenges, but rarely, if ever, do they determine in any absolute manner the course of human activity. As the entries and sidebars under this theme show, the peoples of

the Americas and Oceania faced the daunting challenges of vast distances, intimidating barriers, and dangerous natural forces as they endeavored to communicate and exchange commodities with one another. The fact that they established

long-distance trading networks is a testament to their determination, courage, and skills and perhaps is also evidence of a deep-rooted human need to reach out beyond the limits that nature appears to impose.

The Red Knot, a North American sandpiper, breeds in Canada's Arctic and migrates south to Tierra del Fuego at the southern tip of South America, a distance of approximately 9,300 miles (15,000 kilometers). There is no known human equivalent to this feat in the period 1000–1500, but there is plenty of evidence of human interaction and exchange in the Americas over long distances and across mountains, deserts, rivers, plains, prairies, and forests of every sort during this half millennium.

All of this was accomplished without wheeled vehicles or animals of burden on which travelers could ride. In other words, human travel was exclusively by foot or boat, which greatly restricted the size and quantity of traded commodities. The only animal bred and used for carrying goods was the South American llama, but its use was restricted to the high Andes. Whereas a full-grown llama can carry about 100 pounds (45 kilograms) long distances over rugged terrain and at oxygen-poor altitudes, a Bactrian camel (a distant Asian cousin), which was a mainstay pack animal on the eastern routes of the Silk Road, could transport loads of more than 450 pounds (200 kilograms), although around 330 pounds (150 kilograms) was a more comfortable load for long-distance travel over deserts and mountains. The Bactrian camel, only one of many transport animals used in Afro-Eurasia, also worked in a wider range of climates and altitudes than the llama. Given this relative handicap, it is amazing that long-distance commodity exchange took place in the Americas. But it did.

Archaeological evidence unearthed to date suggests that the Americas had nothing to compare in size, complexity, and scope of activity with such Afro-Eurasian trading networks as the Silk Road and the trans-Saharan caravan routes that are collectively known as the Gold Road. Yet, as the entries included here show, it did have more modest but quite important commercial systems that extended for significant distances. These entries only hint at their number, and one that is not mentioned here, but only

hinted at in the entry on the economic activities of the inhabitants of Chaco Canyon, is the so-called Turquoise Road.

At its height, the Turquoise Road linked the Pacific Coast of present-day California (from which shells were exported to far-distant artisan carvers) to Mexico's Yucatán Peninsula on the Caribbean. The network existed for centuries prior to 1000 CE, but in the period immediately following 1000 CE, Chaco Canyon seems to have been a major distribution and craft hub, connecting the turquoise mines of the present-day American Southwest, especially New Mexico, with central Mexico and beyond. With Chaco's petering out as a community around the mid-twelfth century, other centers picked up the slack. South of the Rio Grande River, the city of La Quemada in northern Mexico appears to have been a major center for trade in turquoise down to the period of the Spanish Conquest. Prior to Chaco's collapse, however, it and other "Anasazi" communities of the American Southwest received and integrated into their culture a number of Toltec customs and traditions out of central Mexico. As is almost always the case, ideas traveled along with commodities.

If long-distance travel was difficult in the Americas, it was ever so much more so in Oceania. The Pacific Ocean covers nearly one half of the Earth's surface, and its islands, even those whose inhabitants share a common culture, such as the more than 1,000 islands that comprise the Polynesian Triangle, are often separated by great distances in an ocean known for being anything but "pacific." Yet due to the technology of the outrigger canoe and a tradition of seamanship in which currents could be read as though they were nautical maps, the Austronesian mariners of the Pacific, namely Polynesians, Micronesians, and Melanesians, were able to voyage and trade not only within their island chains (which is where most interchange took place) and culture groups but occasionally beyond both. We know not whether regular exchanges took place between South America and Polynesia, but surely exchange did occur, with the former giving the sweet potato to the latter and, in turn, receiving a new type of fowl.

Since antiquity mariners have ventured onto the wine-dark sea. Regardless of what drives the

initial adventurers, eventually, almost inevitably, they will be followed by persons who trade goods, and with goods often comes cultural interchange.

—Alfred J. Andrea

The Staple Industries of Mesoamerica

Hernando Cortés, in his travels through the area now known as Mexico, was thoroughly impressed by the cities and markets that he saw. In the market of the city he called Temixtitan (Tenochtitlan), he estimated that more than 60,000 people were present, all engaging in buying and selling goods and services. Many were staple industries, namely activities that provide the greatest economic benefit to a region.

The primary industry in Mesoamerica was agriculture. Maize, or corn, formed the basis of subsistence in pre-Hispanic society. Countless millions of farmers worked their fields raising maize for their families, their overlords, and for barter. In addition to maize, other food crops such

as squash and beans were indispensable. Often these were grown intermixed with the maize or in nearby gardens. Cortés noted that the market had an abundance of green vegetables, which were grown in raised gardens called *chinampas*.

Other agricultural products were grown primarily for barter and trade. The flower industry of the Aztecs, for instance, focused on providing flowers during the year for the upper classes. These were grown locally and were moved by canoe to the marketplace. Likewise, certain chilies, herbs, roots, and medicinal plants were traded in the market.

The most important nonfood crop was cotton. Cotton was used for clothing and bedding and was traded in the marketplace. Cotton sellers sold bolls, dyed yarn, and mantas (blankets). Mantas were sufficiently valuable to the economy that they were one of the few standard units of measure in the moneyless economy of Mesoamerica. Under Spanish rule, cotton mantas became the most valued article from the New World after precious metals. Other fibers were also important, such as maguey fibers. Maguey

➤ MESOAMERICAN CERAMICS

Ceramics were a principal industry in Pre-Hispanic Mesoamerica and came in many sizes, shapes, and designs. Bowls were used for cooking, cylinders were cups, and large basins held water. Each could be decorated in a myriad of ways, yet like fashions everywhere, their size, shape, and decorations changed over time. Archaeologists therefore analyze ceramic forms as a means of understanding change in society. As a general rule, episodes of wealth increased the diversity and decoration of wares, while periods of economic depression constricted styles.

Ceramics were a cottage industry for Mesoamericans. The available labor often came from individual families. Children were sent to riverbanks for clay, and family members broke down the clay clumps and strained out impurities. Because the wheel was essentially unknown, all ceramics were made by hand or in molds and then were painted. The finished products were placed under piles of brush and wood, which were burned

Aztec hand-coiled domestic pottery. The bottom of the dishes have been scored, suggesting they may have been used for grinding chilies. (Werner Forman/Corbis)

to fire the pots. The finished products were then traded in the market.

—Zachary Nelson

was used for ropes and the coarse clothing of the poor. The fermented sap of the maguey plant became pulque, a potent alcoholic drink related to tequila.

A tour of the market revealed other kinds of economic specialization. For instance, obsidian (a volcanic glass stone) flint knappers were present who would reduce a prepared prismatic core into blades. These specialized craftsmen were at the end of a consumption line that started at the Otumba mines, approximately 30 miles away. Miners chipped large obsidian blocks from their geologic matrix. These blocks were then shaped with hammer stones into rough cores. The cores were then carried to the market, where they underwent a final polish with pressure flaking and percussion shaping techniques. Then, the craftsmen could barter obsidian blades stricken from the core. Because metal was extremely rare in Mesoamerica, obsidian and chert (quartz) tools were primarily used.

Metalsmiths were also present in the market. Their objects were fashioned elsewhere and were brought by hand into the market. Metal ore from the Tarascan area of Mexico was dug out of the mountains and carried to villages renowned for metalworking. These villages were located in wooded areas because it was easier to move the ore to the wood than move the large quantities of wood necessary to heat the ore up the mountain. Workers would then reduce the wood to charcoal and burn the charcoal over the metal-bearing ore. After several hours of burning and blowing on the charcoal, a pool of molten metal remained under the slag. This pool was allowed to harden, and then it was beaten into desired shapes. Popular shapes included bowls, bells, and other ornaments. These were then carried by hand to the market to be traded for cotton, obsidian, maize, or other products.

Each valley in Mesoamerica focused on producing different products. The staple industry in one valley could be ceramic pots, while a neighboring valley was better suited for basalt metates, which were blocks of a hard volcanic stone with a shallow concave indentation that were used, along with a grinder known as a *mano*, for grinding maize. In this way, each village could trade for what it needed.

Luxury Industries in Mesoamerica—Metalware and Feathered Garments

Tenochtitlan, the heart of the Aztec (Mexica) empire, in the year 1492 was one of the largest cities in the world. In its great marketplace one could buy anything the New World offered. Merchants bartered maize, amaranth, clothing, perfumes, ointments, stone implements, feathered garments, and even gold and silver. Metal production was a recent innovation (ca. 600 CE) from South American cultures, whose expertise in fashioning metal objects began as early as 1400 BCE. Current theories posit that metalworking expertise was passed along the Pacific coast via oceangoing ships. Despite Central Mexico's late start in working metal, by the arrival of the Spanish, metal objects permeated the empire.

An initial gift to Cortés from Moctezuma consisted of a large golden disk shaped like the sun and worth an estimated 10,000 pesos; a silver disk shaped like the moon; realistic animal figurines such as ducks, dogs, jaguars, pumas, and monkeys wrought in gold; and many other objects as recorded by Bernal Diaz del Castillo. Gold was more prized than silver to the Mexica, although both were mined. Copper was also mined and was commonly used for bells and tweezers. Metal was required as tribute (taxes) by the empire in the forms of unrefined grains, purified ore, and worked pieces. Recent work by Blanca Maldonado on pre-Hispanic metallurgy documented the technological processes behind the artifacts. Ore was mined in the mountains or panned from streams and then was brought to metallurgical compounds in forested areas for processing. It was easier to bring the ore to the heat source (fire wood) than bring sufficient wood to ore-bearing locales. The ore was cooked

► THE POCHTECA

The great aviary of Moctezuma was filled with tropical birds brought alive from Chiapas or Guatemala. Yet these birds were too few to supply the needs of Tenochtitlan and its inhabitants. Tribute requirements from just the province of Tlaxtepec included 24,080 bunches of feathers annually. But trade, as well as tribute, was a major means of feeding Tenochtitlan's constant demand for feathers.

Professional traders, known as *pochteca* (singular: *pochteca*), established routes and contacts within 40 days' travel of Tenochtitlan. They would barter feathers for precious stones, amber, provisions, or whatever would fetch a good price in the next port. Traders traveled in all directions from the empire, returning with porters loaded with exotic goods destined for the upper classes. However, the life of traders was not always easy, and their professional activities were not always straightforward. The Franciscan missionary Bernardino de Sahagún describes the *pochteca* entering into the Chiapas area. Wanting to poach feathers and tropical valuables, they cut their hair like the natives, learned the language, and wore the right clothes. Upon infiltrating the area, they hunted the birds, being careful not to touch the plumage directly. If they were caught, death was their reward. Success meant fame and fortune.

—Zachary Nelson

until it melted, and the slag was then broken up (and remelted sometimes). Workers took the cooled metal, broke it into proper sizes, and hammered it into ornaments. In addition to hammering, trained artisans cast intricate artworks using lost wax techniques. Villages and towns specialized in metallurgic tasks and techniques, which required the raw metals to move from place to place for further refinement.

Another prized industry for the Aztec empire was feather crafts. Feather work is virtually unknown in today's society, but for ancient peoples feathers added pomp to garments and especially to headgear. Rare feathers, such as the long tail feathers from quetzal birds in faraway Guatemala, brought prestige and honor to the wearer. Royal clothing was festooned with feath-

ers, as were most headdresses. Feathers were incorporated into cloth, adding iridescent colors and softness to the outfit. Feather embroidery was an honored craft among the peoples of pre-Columbian Mesoamerica, and trained professionals were valued for their artistic arrangements of cloth and feather. Part of the general difficulty of feather crafts was working with certain feathers. The bright plumage of many tropical birds would rapidly stain when handled. The feathers needed to be plucked, transported, and woven without being touched or else oils from the hands ruined the colors. While some birds could be bred in aviaries, many of the prized feathers were sent as tribute items. This meant that provinces needed to scour the nearby forests for birds. Care was taken to capture the birds without damaging their feathers, which were then hand-carried to the heartland, a distance of more than 500 miles in many cases.

Trade throughout Mesoamerica and Beyond

On October 13, 1492, Christopher Columbus was surprised when a long dugout canoe came out to trade with him as his ships were anchored off the coast of a Caribbean island. The canoe could hold 40 people and was full of trade goods common to the area: cotton, parrots, javelins, and many other items. Columbus did not realize that he was the newest member of the Mesoamerican-Caribbean trade network. The trade network was an informal system for the movement of goods and services throughout all of Mesoamerica and beyond. For the most part, trade occurred at

➤ TULUM—LAST OUTPOST OF MAYAN COASTAL COMMERCE?

The popular tourist destination of Tulum, Quintana Roo, Mexico, is very different than the thriving, living town that Juan de Grijalva compared to Seville in 1518. The main pyramid stands as a silent witness to the great changes that have occurred over the last five centuries. It was built with its back to the sea to protect its religious images from hurricanes and sea storms. But it could not protect its people from the perils of trade and commerce. As Cortés once explained, there was in his country a peculiar illness that only gold could cure. It was this remedy that the Spaniards were looking for in their travels.

Tulum was probably built as a trade center under the direction of the lords of Mayapan around 1200 CE. Situated on the Yucatan's eastern coast, it had sea access to goods shipped from Panama to Honduras. A break in the nearby coral reef allowed canoes access to its beaches, while strong walls protected the city itself from irate customers and enemies. Ocean-plying boats

(Keith Walbolt)

transported ceramics, valuable seashells, dried fish, salt, jade, honey, beeswax, stingray spines, exotic spices, resins, cotton, and worked stones to and from this important trade center.

a very local level; precious feathers from the forest might be traded for cacao beans from a neighbor's tree. Each village also had a local market where goods exchanged hands. For example, potters traded their ceramic vessels for weaver's cloth. Current models of pre-Columbian trade networks in Mesoamerica indicate that elite wares were traded long-distance and that most subsistence items were traded locally.

Perhaps the greatest marketplace known in the New World was the great market of Tlatelolco, which received trade goods from the entire Aztec empire. The market was carefully regulated by police officers to prevent theft and deception. Merchants whose wares were suspect could be fined, beaten, or killed. Each section of the market was devoted to a particular kind of good or service, so buyers could compare prices with nearby stalls. Incidentally, the market did not operate with money. Items were bartered with other goods, although some valuable items acted as currency. Cacao beans as well as cotton cloth could be universally traded.

Trade goods were brought into the city by porters or boats. The city of Tenochtitlan was

situated in a lake (now dried up and under Mexico City). Vegetables and flowers were grown in the lake on raised earth terraces known as *chinampas*. These fertile fields contributed greatly in supplying the food needs of the city. Canoe transport would bring the harvest directly to the market in the city. Maize, cotton, metals, ceramics, and other trade goods also came from the land around the city and as far away as Chiapas to the south. These were carried on the backs of porters, for Mesoamerica did not have pack animals. A typical weight would be 50 pounds (almost 28 kilos) supported on the back by a rope that passed across the forehead (tumpline). Because humans do not carry as much as pack animals, archaeologists have posited that large-scale movement of basic goods over land in pre-Hispanic Mesoamerica would not be reasonable over long distances. The argument is that the porter would eat more in calories than the worth of his burden over these large distances. The assumptions behind this model are still questioned.

It is at the higher levels of trade systems that archaeologists begin to grasp the complexity of

pre-Hispanic networks. When obsidian from Hidalgo, Mexico, was found at Spiro, Oklahoma, it demonstrated the enormous distances that materials could travel in pre-Columbian antiquity. Chaco Canyon in northwestern New Mexico housed pens for tropical macaws whose feathers were used for religious purposes in the Puebloan area. In return, turquoise from New Mexico has been found in Mexican sites. The trade between Spiro and Hidalgo probably occurred indirectly, one trader to another who then traded with another and so on down the line rather than professional Mesoamerican traders, known as the Pochtecatl, traveling from Central Mexico all the way north.

Toward the southern edge of Mesoamerica, the post-Classic Maya centered their trade on sea routes and along rivers. Coastal resources such as salt, fish, stingray spines, and other ritual objects were moved inland via canoes and eventually human porters. Cotton cloth, fine ceramics, feathers, jade, and resins probably moved toward the coast. Excavations from sites currently under water along the Atlantic coast hint at the variety of ways the Maya exploited the sea. Port facilities such as at Tulum facilitated the movement of large quantities of items around the Yucatán Peninsula and perhaps to Panama. Unfortunately, many trade goods do not preserve well in the humid environment, and this constricts the archaeological record. As new sites and artifacts are sourced to their origin, our understanding of this important human activity improves.

Finally, trade is not always tangible. Ideas and stories were traded across Mesoamerica as much as goods. Markets of any kind lend themselves to news and stories. These intangible goods are impossible to find with trowels, but similar stories of gods and heroes appear across Mesoamerica and extend well beyond its boundaries.

Artisan Crafts in the Andes—Textiles and Metals

The period from 1000 to 1500 CE in the Andes produced some of the most spectacular surviving craft work from that region of the world. The region was eventually united under Inca rule (roughly 1400–1532), and under the empire people produced exquisite crafts either as part of a taxation system called *mita* or for the personal use of the nobility. This craft production was specialized often, with whole villages devoted to the production of a specific craft. Inca predecessors, however, should be credited with the development and perfection of these crafts, especially textile production and metalwork.

Textiles have a long and important history in the Andes. Textile production relied on cotton and camelid fibers (from alpacas and llamas) that were spun by drop spindle and dyed with plant and animal products, with urine and other reagents, or mordants, used to fix the colors. Cochineal, indigo, *Schinus molle*, and a variety of other plants and minerals served as dyes. Weavers used back-strap, or self-tension, looms of varying widths on which they could produce a variety of different textures or weaves. Deluxe textiles included additions of feathers, metal and shell sequins, beadwork, animal fur, and decorative fringes and tufting.

Textiles had high social value for many reasons. Exchanges of cloth and clothing played a role in coming-of-age and marriage ceremonies. They were also an important part of religious offerings used to clothe large idols and votive figurines. Cloth, in the form of clothing, footwear, and headgear, also served as a strictly enforced marker of ethnic identity and status. Decorative elements, colors, and design organization often marked the ethnic origins of particular textiles, distinguishing pieces by region and even village

of origin. In the case of textiles for royalty and the nobility, designs may also have had symbolic, narrative, or calendrical meanings.

In the Andes, textiles and their production were also highly gendered. Almost all Andean people could use a drop spindle to produce cotton and wool thread, but weaving was closely associated with femininity. Ideal visions of Inca womanhood rested in the production of cloth and represented one of the primary ways in which women paid tax to the Inca empire. One primary function of the *acllas*, women controlled directly by the state, was production of *cumbi* cloth of vicuña wool reserved for royal use. Men on the other hand took almost sole responsibility for the production of feathered textiles, producing the cloth and obtaining and attaching the feathers.

Metallurgy also has a long history in the Andes stretching back to the second millennium BCE. Gold and silver were most valued, but copper alloys were also common. Gold-, silver-, and copper-bearing ores were smelted in small furnaces. The search for such ores may have partially motivated the southern expansion of the Incans into present-day Bolivia, Chile, and Argentina, where men and women worked to produce metal items. Artisans commonly hammered purified metals into sheets that they could cut, shape, and decorate using inlay, gilding, repoussé, and even paint.

Almost all metalwork in the Andes was ornamental in nature. Jewelry of inlaid gold and silver was a common inclusion in burials of the elite and was presumably worn during their lifetime. The Inca craftsmen also produced three-dimensional human, animal, and even plant images ranging in size from a few inches—used for votive offerings—to full-sized idols such as those that graced the Qorikancha temple in Cuzco. Even items such as tweezers, knives, bottles, and cups may have served more as markers of the owner's status than as purely functional items. The Sapa Inca, for example, reputedly used a gold or gilded hoe to till the soils of the royal fields near Cuzco.

During this period metals were often valued for their color and symbolic associations. The sun god *Inti* was associated with the color of gold. As “sons of the sun,” Inca males placed high

➤ HOW VALUABLE WAS METAL?

How much did ancient Andean people value precious metals? The answer appears to be both more and less than we might think. Precious metals such as gold and silver were clearly the province of the elite and were used to emphasize their high status when it was incorporated into jewelry, headdresses, and garment decorations. We use gold and silver in much the same way. People additionally gave precious metals religious significance. The Inca covered temples in hammered sheets of metal and wrought from gold and silver idols of and offerings to their most important deities. Some people also venerated large nuggets of gold or heavily veined ore as minor deities.

At the same time, archaeological discoveries suggest that for some people in the Andes, gold did not hold exactly the same value as it did for others. Some offerings were thrown into lakes or abandoned on mountaintops rather than placed in temples, where people could see the wealth and power of the Inca state religion. People also placed gold in tombs rather than saving it or passing it on to subsequent generations. Some people even painted over gold with thick layers of pigments, much the way they would paint adobe walls.

(Gordon McEwan)

value in gold jewelry, such as ear spools. The major temple of the Sun, the Qorikancha, is reported to have been heavily embellished with gold plating. The moon goddess *Mama-Quilla* was associated with silver. Inca women often fastened their dresses and mantles with large silver

pins called *tupus*. Commoners were sometimes associated with copper or bronze implements.

The Incan Economy

Andean geography presented distinctly vertical challenges to the region's pre-Hispanic peoples and cultures. Moreover, while domesticable Andean crops and animals included coca, manioc, potatoes, llamas, and guinea pigs (Mesoamerican maize, or corn, arrived as an import), wheat, barley, horses, oxen, and cows did not appear until the so-called Columbian Exchange introduced these and other elements from Afro-Eurasia's biota during the early colonial era. Andean and ultimately Incan economic life, then, necessarily conformed to this harsh environment and its particular food-production package.

Local clans and ethnic groups, or *ayllus*, diversified their agricultural and economic interests, creating, for example, what ethnohistorian John V. Murra called outliers, or colonies. Those primarily inhabiting one particular ecological zone colonized, contracted, or traded with those who primarily inhabited different ecological zones, sometimes only vertically distant. These groups created obligations and paid debts through an elaborate reciprocal gift-giving and community service system, although at least some ethnic competition and conflict occurred within these complex economic webs of influence.

This uniquely Andean economy produced sufficient agricultural surpluses to support several polities and religious movements. The Incan empire (ca. 1450–1532) was only the last and most powerful of the polities that emerged. The Incas, based in Cuzco, their capital city, skillfully imposed their state bureaucracy over preexisting traditional economic patterns. They negotiated with, assimilated, co-opted, or relocated other ethnic groups and resorted to intrigue, intimidat-

tion, and military force against the varied peoples and cultures whose economic activities they managed and taxed.

One of the most effective pre-Incaic patterns that Cuzco absorbed and made its own was the reciprocal and redistributive economic relations of the local lords (*curacas*). In exchange for relieving the curacas from agricultural work, for example, including tending their lands and herds, locals expected and received gifts and other benefits, including large-scale religious celebrations where no one wanted for *chicha*, or Andean beer. Because Cuzco expanded on such patterns and moved to transform its diverse Andean subjects into something akin to a peasantry, scholars sometimes call the Incan empire a redistributive state.

However useful descriptive concepts they may be, the terms "reciprocity" and "redistribution" suggest a more harmonious Incan political economy than actually existed. Historian Steve J. Stern uncovered both pre-Hispanic ethnic rivalries and post-Conquest realignments whereby large numbers of curacas and the communities they represented willingly joined the conquistadores to overthrow the Incas.

These realignments notwithstanding, the Incas successfully extracted vast resources from their subjects for as long as they ruled the Andes. These resources included labor and other services, some of it specialized. This enabled Cuzco to create and staff administrative machinery and a complex communications and transportation grid; storehouses; royal herds; palaces and shrines, some constructed to harness local religious traditions; military facilities; and well-disciplined garrisons.

As it is, this Incan economy and the deeper Andean economic pattern underlying it remain outside mainstream macroeconomic-oriented world history, a line of inquiry that continues to study Eurasia or, according to some, Afro-Eurasia, as if this area represents the world. That is, the pre-Hispanic American past does not presently appear in macroeconomic-oriented world history. Only specialized Andeanist ethnohistorians investigate, theorize, and reconstruct it.

Economic historian Andre Gunder Frank recently reconceptualized macroeconomic-oriented

➤ PROFESSOR EMERITUS JOHN VICTOR MURRA

Much of what we know about the Incas and their history derives from archaeological remains; early colonial records, including oral histories; and the ethnographic present. University of Chicago-trained ethnohistorian John Victor Murra (1916–2006) contributed a powerful interpretive Andean framework in 1956. Murra's dissertation "The Economic Organization of the Inca State" and Murra's concepts, like "vertical archipelago," remain current. And those who studied under or collaborated with Murra while he taught at Cornell from 1968 to 1982 have in turn produced much of the literature treating the Incan empire and its historiographical problems.

Born in the Ukraine and raised in Rumania, Murra immigrated to the United States to study anthropology at Chicago in December 1934. His long-standing activist radical politics, which included several short-term jail sentences in his youth, led him to enlist to fight in the Spanish

Republican Army's international brigades after he earned his bachelor's degree in June 1936. This Spanish experience drew Murra's attention to Andean history. Murra also described falling in love with Spain. Had the Republicans won, Murra would not likely have returned to the United States. He once explained that he had graduated not from Chicago but rather from the Spanish Civil War.

In any case, Murra returned to Chicago in 1939. He earned a master's degree and contributed to the *Handbook of South American Indians* in 1942. Murra's political past caused problems for him as a doctoral student, however. He received American citizenship and a passport only after 1956. Murra researched and defended his dissertation, then, without having left the United States. He later taught in Puerto Rico and Peru before joining Cornell's faculty in 1968.

—James Douglas Lockhart

world history, attacking its alleged Eurocentrism. Frank's reimagined macroeconomic-oriented world history places East Asia at the center of world history while relocating Western Europe to its periphery. But Frank fails to include pre-Hispanic America. This failure derives partly from the task's daunting unmanageability and partly from a dearth of sources among other disadvantages, including the apparent historical fact that the Americas had no contact with Eurasia prior to 1492. Nonetheless, for students of world history, and not only those interested in macroeconomic patterns, reincorporating pre-Hispanic American history into the larger narrative remains an enticing challenge. Meeting this challenge will signal the Incas' and other pre-Hispanic American peoples' and cultures' inclusion in the world history narrative, thus reversing a trend that the Columbian Exchange began long ago.

Chaco Canyon—Consuming Nexus of a Trading Network

Chaco Canyon is an ancient city that has intrigued scholars and the general public since the mid-nineteenth century. Situated in the San Juan Basin on the Chaco Plateau of northwestern New Mexico, this site was occupied by the Anasazi from approximately 500 to about 1300 CE. Concentrated in a ten-mile radius, the core of this nexus consists of 14 multilevel stone pueblos known as great houses, multiple below-ground ritual spaces called kivas, small house sites, signaling stations, water control systems, and roads with north-south axis alignments. The

Kiva at the Anasazi site of Chaco Canyon, in present-day New Mexico. (Zack Frank)

THE EVIDENCE

The roads of Chaco Canyon supported a vast trade network linking Chaco Canyon proper with outlier settlements including Salmon Ruin, Aztec (a name given this ruin in the mistaken belief that the Aztecs, or Mexica, had built it), and Kin Bineola as well as more distant localities in Mesoamerica. A laboring class built many of these roads during the Classic Bonito phase (1000–1100 CE), whereas others, particularly those linking Chaco to northern outlier settlements, were built after this time and helped link people to resources in the region, including wood for construction and clay for pottery. In the 1970s, archaeologists began to positively identify these exchange networks with the aid of aerial photographs. This research revealed that the roadways of Chaco extend far beyond the core architectural features of Chaco Canyon and total anywhere between 129 and 1,490 miles (208 and 2,400 kilometers).

The roads of Chaco have unique characteristics that may help to shed light on their prehistoric functions. First, they are aligned to a north-south axis rather than to the changing topography of the landscape, leading one researcher to describe these pathways as ceremonial highways. Next, the expansion of these roadways is associated with the development of outlier settlements. Known as the Chaco Phenomenon, this florescence catalyzed the movement of people, knowledge, and material culture.

—Alex K. Carroll

spatial dimensions of Chaco Canyon are carefully planned, resulting in a built environment characterized by well-defined ritual and domestic spaces as evidenced by concealed areas such as the great kivas and more visible spaces such as the public plazas.

Three principal models have been proposed to explain how Chaco Canyon functioned. According to the first model, Chaco Canyon served as a trading outpost of the Mexica (Aztec) empire of Mexico. A second theory suggests that Chaco Canyon was the hub of an elite power complex whose economy was founded upon a corporate political structure. And a third school of thought proposes that Chaco Canyon was a center of religious devotion attracting pilgrims and adherents from Mexico as well as diverse populations from throughout what is today the U.S. Southwest. Inasmuch as archaeological evidence supports aspects of each model, it is beneficial to examine Chaco as a complex society with strong sociopolitical, economic, and religious dimensions.

Around 1000 CE, there was a sudden flourishing of activity in Chaco Canyon that resulted in the construction of many of the large buildings for which it is now well known. Within the next 100 years, Chaco's population reached its apex and thereafter began to decline. One theory suggests that Chaco first rose to power as a result of agricultural surpluses. Scholars have noted that the most ancient great houses of Chaco Canyon—Pueblo Bonito, Una Vida, and Peñasco Blanco—are located at the junctures of important drainages. It is surmised that the early inhabitants of Chaco experienced agricultural bounty, which in turn facilitated the progressive economic, sociopolitical, and religious development of this settlement. Recently it has been suggested that the society of Chaco Canyon was structured as a matrilocality, meaning that married couples settled in the location of the wives' families. It is posited that within this social structure women maintained strong agricultural economies, whereas men's labor was directed toward the development of local, regional, and long-distance trade.

A select group of people, possibly even a ranked priesthood, increasingly directed the use of land and resources, and several economies

began to emerge. These included the economy of local residents; trade between local residents, visitors, and other communities; the sustenance of pilgrimage visitors; and the imports and exports of pilgrim goods, including tributes, ritual offerings, and items of sacred material culture purchased in conjunction with pilgrimage activities.

The people of Chaco Canyon traded turquoise, ceramic wares, wood figurines, copper bells, feathers, and shells as well as core subsistence items. Long-distance trade may have occurred with the *pochteca*, middlemen traders from Mesoamerica, or pilgrims who exchanged luxury items, including copper bells, macaw birds and feathers, and shell inlay. Other items, such as turquoise, ceramic wares, and wood figurines, were most likely produced and exchanged within Chaco Canyon and surrounding settlements within the Southwest. For example, Chaco played a key role in the production and exchange of turquoise. At Pueblo Bonito, the first site excavated at Chaco Canyon, archaeologists unearthed 56,000 pieces of turquoise dated from the period 900 to 1500 CE. Many people within Chaco Canyon fashioned ornaments out of turquoise. Production of turquoise was done principally at the household level rather than through specialized craft areas. Outlying communities of Chaco Canyon also supported a thriving pottery industry. During each phase of Chaco development, the styles of pottery changed. The earliest potters who lived and worked in the Anasazi Basketmaker III period (400 or 500 CE to 725 or 750) created pottery with simple designs made in the vicinity of Chaco. By the late Bonito phase (1120–1220), Chaco residents increasingly imported ceramic wares from the Hopi and Mesa Verde areas.

Trade along the Waterways of North America

Native Americans had a wide variety of trade and exchange networks throughout North America prior to the arrival of Europeans. Many of these trade networks followed natural geographic features such as canyons, mountain passes, and especially waterways. Rivers, large bodies of water, and coastlines were all used to transport such items as obsidian and other stone materials,

➤ OUR EVIDENCE FOR TRADE EXCHANGES

The evidence for trade along the waterways of North America comes primarily from archaeological data. By analyzing the number of artifacts found at a site, the artifact type(s), and the site's general location, archaeologists are able to deduce how these artifacts arrived there. Those artifacts made from a nonlocal material had to have been either brought there by the inhabitants themselves or acquired through trade and exchange. If there are a relatively large number of nonlocal artifacts over a wide chronological period, archaeologists conclude that some form of trade or exchange network must have existed between the resource and site locations. When all of this evidence is present at a site and the site is located near or along a current or prehistoric waterway, archaeologists are able to conclude that the trade or exchange network relied on the waterway for the transportation of goods. In some instances specific water-based transportation vehicles or artifacts have been recovered, reinforcing the conclusion that trade occurred along the waterway.

—Peter N. Jones

Hohokam shell pendants recovered from the site of Pueblo Grande, in present-day Arizona. The Hohokam traded for shells from the Gulf of California and the Pacific Coast, which they used to make ornaments for personal adornment and also for trade. The Hohokam were proficient in cutting and grinding shells into rings, bracelets, pendants, and animal figures. (Pueblo Grande Museum, Laura Andrew photographer)

shells, copper, feathers, fur, and other trade goods. These goods were highly valued for a variety of economic, religious, and social functions. Although evidence indicating exactly how these goods were transported is minimal, it appears that they were either transported by foot or watercraft, as Native Americans did not acquire the horse until after European contact.

Obsidian, a razor-sharp volcanic glass that made superior knives, and other stone materials, for example, were traded over long distances throughout the period preceding contact with Europeans, linking areas as vast as Mesoamerica to the southeastern regions of the present-day United States and the Arctic regions of present-day Canada and Alaska to the Great Basin (present-day Nevada and bordering desert areas). The prehistoric and protohistoric trade of Edziza (northern British Columbia) obsidian occurred throughout the western Subarctic, northern Plateau, and southern Arctic regions. Edziza obsidian was traded down the Stikine River and then north and south along the British Columbian and Alaskan coasts and is documented to have reached as far away as the Alaska Panhandle to

the west, north into the Yukon, south and east into the interior of British Columbia, and across the Rocky Mountains into Alberta. Likewise, obsidian from Oregon (e.g., Newberry Crater obsidian) appears to have been traded down the Columbia River to the coast and then north through Puget Sound and up the Fraser River into the interior of British Columbia as well as into southern Idaho and parts of the Great Basin. Shells from several varieties of species appear to have been traded up and down the Columbia River system, most originating either in the Puget Sound area of Washington or farther south, along the California coast. Similarly, shells traceable to central California have been recovered as far away as Danger and Hogup Caves in Utah and north into southern Idaho via Columbia River waterways.

There is also a large body of archeological evidence indicating constant trade connecting the Gulf Coast and the Great Lakes across the Appalachian Plateau and down to the Susquehanna or Hudson rivers as well as to the lower Missouri River, the Northern Plains, and up into Canada, in essence creating one large trade network. Furthermore, archaeological and ethnological evidence indicate that there was an east-west pattern of exchange along the waterways, which directly tied the Northern Plains to the Great Lakes and the Missouri River west across the Rocky Mountains to the Pacific coast.

The Trade Network of the Thule Inuit

The prehistoric Thule people of Arctic Canada and Greenland occupied one of the most desolate regions of the Arctic approximately 1,000 years before the present. Originating in northern Alaska, the prehistoric Thule peoples spread eastward across Arctic Canada in a matter of a few centuries. Relevant archaeological sites are located on Victoria Island, Baffin Island, the Queen Elizabeth Islands, Arctic Canada, and northern Greenland. Across this desolate and harsh region, the prehistoric Thule people established a complex and wide-ranging trade network that stretched from Alaska to Greenland, south into central Canada, and even into far western Europe.

Organized into various local and subregional population groups, the prehistoric Thule peoples traded iron, smelted copper, soapstone, whale meat, and other goods of value. Iron, for example, was an important trade commodity, as indicated by the many small pieces of iron found in many Thule archaeological sites. Iron of meteoric and European smelted origin found on Thule sites in the central and eastern Arctic probably originated from Greenland, where many items of Norse manufacture have been found in Thule sites. Likewise, other objects of European manufacture have been found in several Thule sites across the high Arctic, indicating at least indirect contact over a period of several centuries with the Norse Greenland colonies. Similarly, evidence for iron has been recovered as far west as Silumiut, on the west coast of Roes Welcome Sound in present-day Nunavut.

Lamps and pots carved from the soapstone deposits of the central Canadian Arctic have been recovered in Thule sites around Foxe Basin in southern Nunavut, and archaeological evidence indicates that by 1200 CE they began to be traded westward to the northern Alaska coast. Likewise, evidence indicates that Thule peoples traded ivory south into the Canadian Arctic as well as down along the northeastern coast along present-day Labrador. In the western Canadian Arctic, the Thules used local copper to make harpoon blades, and regional trade of soapstone is evidenced.

UNCOVERING THE THULE INUIT TRADE NETWORK

Archaeological sites located across the Canadian Arctic give evidence to the extent and complexity of the Thule Inuit trade network. Collections from these sites have a high frequency of copper, iron, and bone tools, indicating a strong trade network. For example, the Silumiut, located in northwestern Hudson Bay, have produced a substantial number of iron fragments that neutron activation analysis shows were originally sourced from western Greenland. Approximately 2,650 whole or broken artifacts of stone, bone, antler, ivory, baleen, wood, iron, and copper were also recovered from the site, only a few of which were locally available. Likewise, the composition of iron found at Naujan, located on Repulse Bay in Nunavut, indicates that it traded all the way from Melville Bay in western Greenland. The copper recovered at the site, on the other hand, was traded from the Coppermine River-Coronation Gulf area of Canada. The copper artifacts recovered included a projectile point or end blade, a knife blade with a narrow tang, a thin broken knife blade fragment, and a small knife blade fragment embedded in a wooden handle. The iron pieces recovered included a large knife blade fragment, an almost whole projectile point, and a small metal piece set into the blade slot of an eroded antler lance head. Together, this and other evidence recovered across Canada indicate that the Thule Inuit maintained a long-distance trade network that spanned the Canadian Arctic from Alaska to Greenland.

—Peter N. Jones

This trade network not only ran from the Canadian Arctic east to Greenland and south into central Canada but also west along the coast and into Alaska. Evidence of long-standing trade between the central and western Arctic and the increased number of Thule cultural traits appearing in northern Alaska during the century prior to European contact indicate that this trade network was extensive and well established.

The Network of Exchange in Micronesia

The three main areas and peoples of Micronesia who have historically engaged in a network of trade, each with selected wares exchanged, are western, central, and eastern Micronesia. Western Micronesia includes the Mariana Islands highlighted by Saipan and Guam and the islands of Yap and Palau; central Micronesia includes the Caroline Islands, Nukuoro, and Kapingamarangi islands, and Pohnpei and Kosrae; and the eastern section of Micronesia includes the Marshall Islands, Nauru, and the Gilbert Islands, featuring the atolls of Kiribati.

Around 1000 CE a new architectural style building in stone instead of wood developed called the Latte Phase, and this new style indi-

cates active trade patterns. The latte style relies on large stone pillars with capstones to support important communal houses and canoe sheds, with the best examples to be found on Tinian and at Agana, Guam. Either coral limestone or volcanic rock was used in constructing latte columns, and these building stones were locally traded. Seafarers of Yap sailed to Palau to trade for argonite stone, which they then transported back by canoe. This stone was used in making the large stone disks used as Yap stone money called *fae*. These disks (with a hole in the center to carry it with a pole) usually remained on clan estates leaning against clan houses as a mark of status, wealth, and prestige. During marriage ceremonies, the *fae* were given as a gift by the bride’s family to the man’s family, which presented shell money in return.

The ancient prestige of the “Yap empire” is illustrated by the traditional *sawei* exchange system. This was an annual tribute exchange system in which several canoes laden with valuables sailed from Namonuito, Pulap, Puluwat, and Pulusuk—eastern islands of the Caroline Islands—to Elato, Lamotrek, and Satawal picking up additional canoes destined for Yap along the way. This *sawei* fleet proceeded on to Ifalik, Woleai, and Eauripik and then on to Fais, Ulithi, and finally to Yap, where the presents (tribute consisting of sennit rope, coconut oil, woven mats, plaited skirts, and shells) were awarded to the chief of the village of Gatchepar. Three types of tribute—canoe, religious, and land tribute—were presented. Land tribute was granted by various islands’ representatives to their trading partners in Yap in recognition that the Yapese chief claimed the lands within this entire island network. The Yapese would reciprocate with scarce goods, such as turmeric, wood, flint, and needed food items. This annual tribute brought by the *sawei* fleet maintained harmonious relations between trading partners. Smaller trading networks existed, as among Lamotrek, Elato, and Satawal islands, with the chief of Lamotrek receiving sea turtles, coconuts, and breadfruit as tribute in exchange for granting to the other islanders fishing rights on Lamotrek-claimed reefs.

All islanders of the region pledged assistance to each other in time of food shortages produced by natural disasters such as typhoons. Canoe build-

Latte stones on the Micronesian island of Tinian. (C. T. Snow)

ing was highly developed, with many specialized types of canoes crafted. Navigators crossed wide expanses of the ocean to trade, relying on the winds and stars as compasses.

In the west, the Marianas produced and traded pottery called Marianas Red, a plain, red-slipped ware. Its decor may have reflected ancient traditions and styles inherited from the Philippines. This pottery is decorated with circles and impressed lines filled with white lime.

In central Micronesia, early pottery found on Pohnpei may reflect influences from the late Lapita culture, which had originated in Melanesia and may indicate migration patterns into Micronesia. The basalt stone-block ceremonial center of Nan Madol in eastern Pohnpei built on nearly 100 artificial islets has been called the “Venice of the Pacific,” as the islets were interconnected through boat travel. Nan Madol was a significant administrative center in central Micronesia from which the Saudeleur dynasty of chiefs known as the Lords of Teleur ruled from the ninth through the sixteenth centuries, dominating the regional trade essential to their power. The stones used in Nan Madol’s construction and expansion (including burial sites) were a vital part of Pohnpei’s local trade, as the stones were brought some distance from where they were quarried.

In eastern areas as elsewhere, Micronesians traded extensively in taro and breadfruit—important food sources—as well as coconuts, bananas, and coconut palms. Betel nut, the seed or nut of the areca palm, which when taken with lime and leaves of an astringent species of pepper acts as a stimulant to be chewed (staining the saliva and teeth red), was often circulated through trade channels. Kava, called *sakau* in Pohnpei and Kosrae, was widely traded as a hospitality-welcoming drink for visitors or for ceremonies. Chickens, pigs, and dogs were widely exchanged, as were fish and shellfish of all types. Pandanus leaves, tolerant of salt conditions, were traded for making canoe sails or were woven into fine matting. Peoples of the Caroline Islands made loomed wraps woven from hibiscus or banana leaves to be used as waterproof garments. In the Gilbert Islands men wore armor made from coconut fiber to protect them against weapons made with shark teeth, and these were

➤ PALAU BEAD MONEY

The bead money of Palau consists of strings of glass and ceramic beads that were not of local manufacture. The exact origin of these beads remains in question but may point to trade links with Asia via the Philippines and may even extend back through ancient times to China and its cross-continent links via the caravan Silk Road trade to the Mediterranean world. The fine glass beads appear to have been influenced especially by the glassmakers’ techniques of ancient Italy. Trade in these beads could reach as far back as Roman times. The ceramic beads, which are hollow tubes of fired clay, are similar also to African trade beads and may indicate a historical link with Africa as well, although the African ceramic beads were usually hand-painted with brightly colored designs. However, this may reflect more recent developments in Africa after pigments were introduced. As the glass and ceramic beads were not of local manufacture and were received through trade, the Palau bead money indicates the connections of Micronesia with far-flung regions of the Pacific Rim.

—Barbara Bennett Peterson

goods also sold in trade circles. Palau was known for its craftsmanship of wooden boxes inlaid with shells. Barkcloth, made by pounding the inner bark of the paper mulberry or breadfruit trees, was also used in making sails and was widely traded. Tattooing was practiced in the Caroline and Marshall Islands, and tools for this art form, including fine bone chisels with teeth, mallets, and pigments, were items of trade. Status was often reflected in the quality of the tattoo, hence the highest-quality tools for incising this bodily art form were coveted trade goods. The development of Micronesian trade networks helped spread Austronesian migrants and their languages.

In Micronesia, social organization was usually based on matriarchal kinship, often with both land and goods passing through the female line. Marriages and the exchange of bride wealth took place between matrilineal clans. On Pohnpei, ranked titles descended through these matriarchal clans as well. Typically a large rectangular open-sided

thatched house called the *maneaba* offered the community a common focus throughout Micronesia and was usually the site for ceremonial trade exchanges, and trade, as in adjacent Pacific island communities, was the basis for political authority.

Trade within the Polynesian Triangle

The Polynesian Triangle had formed by 1000 CE with its three corners based in Hawaii, New Zea-

land (Aotearoa), and Easter Island (Rapa Nui). In the Triangle's center, trade developed first locally and then spread to close islands and extended over longer distances. Trading circles developed within the Fiji-Samoa-Tonga island complex and within the Tahiti-Tuamotu complex, with trade extending outward from Tahiti to nearby islands of the Marquesas, Manahiki-Rakahanga, the Cooks, Tubuai, and Rapa. Longer-distant trade took place between these two major trading circles. Trade reached westward from the Fiji-Samoa-Tonga complex through the New Hebrides, Tikopia, and Santa Cruz islands, extending to Ninigo and northwest to the Gilberts.

Commodities exchanged included taro, yam, breadfruit, sweet potato, coconut, chestnuts, pigs, dogs, chickens, harvested fish and shellfish, and bark cloth (*tapa*) made from the paper mulberry tree. The presence of the sweet potato, native to South America's Andes, indicates some type of early trade contact between eastern Polynesian islands (perhaps Tahiti) and mainland South America. Recent radiocarbon and DNA evidence

► POLYNESIAN DOUBLE-HULLED CANOES

The Polynesian double-canoe, which consisted of two parallel canoe hulls joined by crossbeams to form a stable craft capable of carrying large loads on long ocean voyages, evolved through hundreds of years of boat-building processes, beginning with the rudimentary early dugout canoes found in islands of the Southeast Asian archipelagos and culminating with the Tongan Tongiaki double-hulled canoes seen by early contact Europeans that carried 30 to 100 people.

A mast with a low-set sail was originally attached to the dugout canoe. But as larger sails were desired, the larger masts made the canoe unstable, giving rise to the Lapita people's solution of attaching an outrigger float on one or both sides to prevent tipping. In Polynesia canoes became longer and deeper as planks were attached on each side and tied to the V-shaped dugout hull. Braces were fixed on the inside, planks were added for seating, and covered areas were added across the hull for protection against inclement weather. Lashings were made from sennit, which was woven from coconut fibers or palm leaves, and caulking was made using a paste of breadfruit gum. Sennit lashings made the canoe flexible on the ocean so that it would not break apart in violent storms. Eventually a second long V-hulled canoe was attached to take the place of the float, producing the double canoe for long-distance voyaging. Larger sails as well as two sails could then be used. A strong platform was built across the void to hold the two canoes together, and a grass hut for sleeping was constructed on this platform. In front of the hut was a sandbox container for building a small fire for cooking. In

*Double-hulled canoe of the Society Islands, about 1800.
(Mary Evans Picture Library/The Image Works)*

essence, Polynesian mariners had constructed a catamaran.

The double-hulled canoe was steered by a large oar at the stern acting as a rudder. The lateen, inverted triangular sails, were woven from pandanus leaves. Navigators used the sun as a compass by day and used the stars by night and could read directions using winds, currents, and the flight patterns of birds. The double-hulled Polynesian canoes were the oceangoing craft capable of crossing thousands of nautical miles within a month that accomplished long-distance migrations and colonized the three distant corners of the Polynesian Triangle. These were the canoes, plus their smaller versions, that conducted voluminous trade within Polynesia.

—Barbara Bennett Peterson

also indicates that prior to European contact, Polynesians introduced chickens to Chile, where in 2007 Araucana fowl bones found on the Arauco Peninsula were dated to between 1304 and 1424 CE. These chicken bones were similar to bones found in Tonga and American Samoa dating from the same period. Seafaring Polynesians it is now believed landed in the Americas before Columbus by crossing the Pacific to trade and possibly to settle.

Lapita pottery as an item of trade had entered the western regions of the Polynesian Triangle

around 1000 BCE from the Santa Cruz Islands, Vanuatu, and New Caledonia areas and continued to be made and traded within the Fiji-Samoa-Tonga trading complex. The Lapita Pottery Trail marked the path of early Polynesian migrations eastward. The pottery crafted and exchanged, known as Polynesian Plainware, became simpler in design and decoration and eventually died out entirely in eastern Polynesia, where the inhabitants used gourds and woven baskets. Later Fiji potters developed a paddled-impressed ware that was influenced by styles in New Caledonia. After

1100 CE another style developed in Fiji related to the wares from Vanuatu, indicating the exchange of ideas and techniques in trade in addition to the barter for the clay pots themselves.

In New Zealand, cooler climates dictated a limited range for the growth and distribution of tropical food crops; yam was grown only along the northern coast of the North Island. New Zealand's staple was the sweet potato (kumara), introduced in the canoes of the first Maori colonists from Hawaiki and cultivated on the North Island and the northern coastal regions of the South Island. Trade around both islands allowed for exchange of these various foodstuffs. Maori traded such minerals as argillite, chert, greenstone (nephrite jade), and obsidian for tool making. Moa, seal, whale, and dolphin meats (and moa eggs) were exchanged food products, as were fish and shellfish, and the roots of native fern and the cabbage tree and flax were used in weaving local cloth for apparel and trade. Greenstone was a favorite trade commodity for personal ornaments, ceremonial adzes, and household decorations. South Island, the best source for this jade, was called Te Wahi Pounamu (Place of Greenstone). The trading circle in New Zealand included both major islands and the offshore Chatham Islands, where sealing was especially good.

In southeastern Polynesia, a smaller triangle of trade included Pitcairn Island, Henderson, and Mangarava. Mangarava was famed for its black pearls and mother of pearl shells, both made into jewelry for trade. This region specialized in healthful exotic fruits: limes, lemons, pomegranates, papayas, passion fruits, bananas, and coconuts. The lime was native to Southeast Asia, carried into Polynesia and hybridized (crossed with a lemon) in Tahiti.

On Easter Island the stone statues (*moai maea*) on ceremonial platforms (*ahu*) that housed buried ancestors were key elements of this remote Polynesian society, with the quarry at the volcanic crater of Rano Raraku furnishing the stone for the *moai* and a quarry at the cinder cone of Puna Pau supplying the stone for the red topknot (*pukao*). Local trade exchanged sweet potato, yam, taro, sugarcane, gourds, seabirds and eggs (Sooty tern), chickens, and spearheads of volcanic glass. Around 1500 CE a birdman cult

developed as a competition to collect the season's first tern egg and claim the chief-warrior title of *matatoa*.

In Hawaii around-island and interisland exchanges involved barter in pigs, breadfruit, coconut, vegetables, taro, yam, sweet potato, bananas, sugarcane, ti root, and *awa* (kava, a drink from the pepper plant), fish and shellfish, fishhooks, netting, tapa (or kapa) cloth, conch shells, feathers (red and yellow especially), weapons, carvings, nose flutes, feathered capes, cloaks and helmets, and sandalwood.

Throughout Polynesia trade was often ceremonial, involving a welcome for visitors and an exchange of gifts. Trade satisfied basic needs, cemented alliances, and assisted kinship groups. With the coming of Europeans, iron would become the most sought-after trade good in the Polynesian Triangle because Polynesians had lacked metals.

Trade in Melanesia—Trade in Essential and Symbolic Wares

In Melanesia, political leadership was often associated with a chief's ability to secure vast wealth in and control over prestigious trade goods. This dominance in trade wealth translated into political power and alliances. The *kula* ceremonial exchange network served to empower ambitious potential leaders and also served to connect peoples in the southeastern promontory of Papua New Guinea and islands offshore in the Solomon Sea: Normanby Island, D'Entrecasteaux Islands, Trobriand Islands, Marshall Bennett Islands, Woodlark, Laughlan Islands, Louisiade Archipel-

ago, and the Engineer Group of islands. The path of the kula trade formed a circle among these islands through which two types of valuable goods moved, inasmuch as kula was of two types: red shell necklaces called *soulava* moved clockwise around this circuit, while the armbands or bracelets of white shells called *mwali* moved counterclockwise.

This trade was conducted between trade friends or trading partners both locally and between neighboring islands of the circle, and these trading-friendship networks lasted throughout life, often cementing alliances and kinship groups. Usually the men of a village would go with their chief to visit their trading partners on other islands in ceremoniously carved and painted canoes decorated with cowrie shells. Presenting large amounts of *soulava* and *mwali* earned them great prestige, and custom demanded that their partners reciprocate in a return visit. If one was presented with a *soulava*, he was duty bound to return a *mwali* of equal value in the future, and thus the trade circle continued indefinitely. The finest shells were sought for the kula jewelry, and exchange of other goods—foodstuffs, masks, costumes, feathers (bird of paradise and parrots especially), shells, mats, tattoo chisels, and bamboo flutes—followed the exchange of kula and the attendant ceremonies of respect and friendship. Trade within the kula ring is at least 500 years old. This was a highly structured and repeated reciprocal exchange of valuables and essential commodities with elaborate ritual ceremony. The kula trade allowed former antagonisms between villages to heal and reestablished good relations, thus minimizing warfare and regional hostility.

Additional gift-giving ceremonies took (and take) place on a more localized level in the Trobriand Islands during mortuary ceremonies, when women compete with each other to give gifts of skirts and banana leaf bundles to other women attending the burial in order to gain respect and status and, not incidentally, to bind the family together.

Several Melanesian islands created (and still create) symbolic wares, such as the slit-gongs or slit-drums (*tam tam*) topped with carved human faces, especially in Vanuatu on the islands of Ambrym and Malekula where they were placed

➤ TROBRIAND ISLAND YAM HOUSE

Yams were a symbolic form of wealth in the Trobriand Islands of New Guinea, conveying wealth and status and garnering for their owner political respect. Much of the yam crop was grown for ceremonial exchange by women who competitively cultivated huge yams in their household garden plots. These large yams were seen as being owned by the women who cultivated them. Yams require dry well-drained soil conditions and were most important in Melanesia and western Polynesia. At harvest time the yams were piled into conical pyramids, with the largest on the bottom for display in the front yard to be admired by all. After a few days the yams were placed in the household yam house by the wife-cultivator to become the pride of her husband and a source of his power and prestige in the community. A full yam house was viewed as a treasure chest of money to be used to purchase other commodities. In Tonga, yams were once a tribute item presented to the paramount chief known as Tu'i Tonga in a "first fruits of the season" ceremony.

—Barbara Bennett Peterson

on open ritual dancing grounds. They were used in song and dance ceremonies and to signal inhabitants to attend, and the carved faces may represent ancestors and the drums themselves the seat of the ancestors' spirits during ceremonies. These drums were often used in ceremonies to celebrate an individual's rise in rank through a graded society, as were tree fern sculptures, with each form reflecting the participant's new rank. In Vanuatu individuals moved through ranked grades of the *warsangul*, or the social hierarchy, by making sacrifices or payments in goods and submitting to essential rituals of initiation. Many rituals were accompanied by the creation of artistic carvings, and the special designs were owned by their creator. The *malanggan* ceremonies (honoring the recent dead and ancestors) of New Ireland, Papua New Guinea, dictated the creation of new artistic carvings done for each special celebration. These symbolic wares used many different materials—wood, plaited rattan, decorated bark cloth, and

especially shells—and their styles were often identifiably related to specific localities.

Melanesian societies were usually self-sufficient food producers. However, several communities produced specialized trade articles. The Motu people living in Port Moresby made pottery that they exchanged for sago. They traveled with their Motu pottery along the northern coast of New Guinea in multihulled trading canoes. So successful were the Motu that they became (with the friendship and sailing skills of their allies, the Siassi, to assist them) middlemen in trade extending from northern New Guinea throughout the islands of New Britain in the Bismarck Archipelago. The Motu traded in pottery and specialized meats (pigs and dogs). Motu pottery may have been influenced by Lapita pottery that had been produced without a wheel as early as 1600–1300 BCE in New Caledonia as well as by another pottery tradition in central Vanuatu, Mangaasi ware, developing around 700 BCE to 1200 CE, that included relief decorations and incising.

Trade was used in Melanesia to unify its distinct cultural groups whose peoples spoke more than 1,000 Austronesian languages. Trade enabled the exchange of both subsistence farming commodities—taro, yam, sweet potato—and domesticated and marine resources. Melanesians harvested reef fish, shellfish, sea urchins, sea cucumbers, sea slugs, and seaweed plus seabirds and turtles as trade items. Trade also established status. A full yam house represented high status. In the Highlands of New Guinea, a large herd of pigs identified its owner as a “big man” who held power through symbolic wealth. Melanesian “big men” were not hereditary chiefs but attracted supporters through ceremonial exchange and feast giving. A traditional form of wealth in Malaita, Solomon Islands, was “shell money.” Long strands of shell beads were made by working individual shells into disks and stringing them. Shell money was used most commonly at weddings as a form of bride wealth whereby the groom presented shell beads to the bride’s family. Shells were also sought for knives and scrapers. Large shells were ground into adzes and used as tools rather than polished stone. Through trade, tribute, or their extended family,

Melanesian chiefs accumulated food surpluses and symbolic wares as symbols of power.

New Guinea and the Solomon Islands—Trade between Peoples of the Coast and Peoples of the Interior

Extending far into the distant past, New Guinea’s rich tradition of body adornment dependent on trade goods was a strong impetus to exchange between the peoples of the coast and the peoples of the Highlands. Moreover, throughout Melanesia political leaders have long sought to control prestige items of trade to maintain influence. Shells from the coast pass through several levels of exchange on their way to the Highlands of New Guinea, while feathers used in personal adornments have been and continue to be traded southward toward the coast. People of the Mount Hagen region of the Highlands thus gain decorative shells necessary to their local ceremonial trade between trade friends and for personal bodily decoration. Men have traditionally worn linked small bamboo sticks down their chest indicating how many pearl shells they have given to their friends in trade, thus marking their status and generosity. In return, coastal people gain from the Highlands decorative dark tail feathers and the crown plumes of various types of Birds of Paradise plus plumage from parrots, cassowaries, and eagles, which they use for self-decoration. For centuries and probably millennia, body adornments have traditionally been worn throughout

New Guinea, especially in the elaborate headdresses used in religious cult performances, dance rituals, and cultural fests called Sing Sings. The most elaborate occasions for self-adornment have been traditionally associated with the events of ceremonial gift giving. Both men and women participate in these rituals and have different decorative styles, with men adorning themselves more ornately, such as with brighter feathers, and with the most highly prized items gained through trade. This continuous need for body adornments has perpetuated ritual exchange and harmonizes relations between regional societies.

Since before the arrival of Europeans, the traditionally elaborate headdresses of the Highlands have been made of human hair sculpted into wigs and adorned with feathers, plumes, strings of seed pods, fur of marsupials such as the tree kangaroo and the cuscus, pig tusks, and dried flowers. These headdresses have various names such as *manda tene*, or down-turned wig. Yellow and red are the traditional colors of paint applied to the face, especially by men, in self-decoration. Women wear pearl-shell crescent necklaces and cowrie shells woven into their head coverings or as necklaces as status symbols in the Highlands.

Pigs were an important item in the *tee* exchange system of the Tombema-Enga people living in New Guinea's western Highlands. This trade was usually dominated by a "Big Man," whose wealth in pigs allowed him the political power to dominate the exchange in the shells-for-feathers trade between the Highlands and the coast. The hereditary chiefs of the Purari of the southern coast maintained power by accumulating shell ornaments used in trade with the Highlands and through obligations to themselves earned through the giving of food.

In the Solomon Islands coastal peoples exchanged fish and palm oil for fresh vegetables, cocoa, and timber from the interior. They also exchanged items similar to the New Guinea trade used in personal adornment. In both New Guinea

➤ HEREDITARY CHIEFS

In Papua New Guinea the chieftainship was usually inherited from father to son as among the Mekeo, a clan that lived along the southeastern coast, but they also developed a system of dual chiefs. There were a civilian chief ("chief of the village") for preserving harmony through trade and a military chief ("chief of the spear") for potential threats faced in battle. The civilian chief was usually a senior member of the community, and the military chief was a junior but physically stronger society member. Only the chief of the village's position was based upon wealth, and this served to emphasize the need to accumulate goods garnered through trade to maintain his more prestigious power and to preserve the peace. "Big Men" of the Melpa of the Highlands were also drawn from a close-knit dominant group that controlled the major exchange of valuables. Thus, the most influential power was maintained by trade both along the coast and in the interior.

—Barbara Bennett Peterson

and the Solomon Islands this trade linked peoples of related but distinct languages and customs. The exchange of valuables between trading partners has for unknown ages been a means of preserving the peace, with everyone, from the coast to the interior Highlands, receiving the items necessary to their way of life.

—Barbara Bennett Peterson

War and Diplomacy

War is a constant fact of human life, and this was particularly true in the period 1000–1500 CE. It was an age of invasions on a grand scale that involved vast numbers of attackers and victims alike. It witnessed holy wars in both hemispheres. It was a half millennium in which wars were fought with great brutality and no rules by most combatants, but it was also an era in which some sought to ameliorate the horrors of war by establishing codes of warrior conduct. A few even sought peace as a noble goal. As is true of every time and culture, it was also an age in which many combatants were not reticent to negotiate alliances, truces, and surrenders when it suited their purposes. A few even sought to turn enemies into friends.

This last phenomenon is exemplified by the meeting during the Fifth Crusade (1217–1221) between Nasir ad-Din Muhammad al-Kamil, sultan of Egypt, and Francis of Assisi, an Italian religious reformer, in the late summer of 1219 in the Egyptian delta. Al-Kamil, who had succeeded to the sultanate during the initial stages of the crusaders' assault on Egypt, desired peace for practical reasons. His throne was far from secure. Twice in 1219 he opened negotiations with the crusaders, offering them Jerusalem and other generous terms in return for their quitting Egypt. In the midst of the second period of negotiations and momentary truce, Francis visited the sultan's camp in an effort to convert him to Christianity. Possibly word had reached Francis that the sultan was known for his generosity toward Egypt's Coptic Christians. Al-Kamil received Francis and his companion, Brother Illuminatus, in peace, asking them why they had come. A Franciscan legend maintains that Francis proposed walking through flames, protected only by a copy of the Gospels, to prove the truth of Christianity. The sultan refused the challenge and the offer to convert but offered Francis and Illuminatus food and rich gifts. They declined the latter. Al-Kamil then had Francis escorted back to the Christian lines. Whatever the truth of the particular elements of this story, it is clear that al-Kamil treated Francis and Illuminatus with generosity and a certain sympathy, even as crusaders were attacking his land. The sultan probably saw in Francis a mirror image of the Sufi mystics of Egypt whom he patronized.

Neither Francis nor al-Kamil was a pacifist in the modern sense of the term. Francis and his friars perceived their missionary work as a complement to Christendom's armed struggle against Islam. On his part, al-Kamil desired peace for largely strategic reasons. And yet when the army of the Fifth Crusade was encircled and defeated in 1221, the sultan chose to offer the crusaders a peaceful withdrawal from Egypt in exchange for the city of Damietta, which they had captured, rather than

annihilating them. He even provided the enemy army with food, and the sultan's act of statesmanship appears to have filtered down to the Egyptian populace. A crusader from Germany remarked with awe: "Those, whose parents, sons and daughters, brothers and sisters we killed with various tortures . . . or whom we cast naked from their houses, refreshed us with their own food as we were dying of hunger, even though we lay under their control and power."

Eight years later, al-Kamil and Emperor Frederick II shocked Muslims and Christians alike when the Western emperor accepted the sultan's offer of Jerusalem (but with continued Muslim control of the city's major Islamic shrines) in return for Frederick's ending the Sixth Crusade (1227–1229) and agreeing to a ten-year truce that freed both monarchs to pursue their interests at home. The accord was roundly denounced by pious Muslims and Latin Christians alike. Although Muslims and crusaders had, for strategic reasons, periodically negotiated truces throughout the twelfth century, negotiating away a holy city or allowing infidels to retain possession of some of its holy sites was beyond the norms of accepted behavior. Holy war, be it crusade or jihad, was just too deeply ingrained in the psyches of thirteenth-century Western Christians and Muslims.

War was also an integral part of the cultures of so many other peoples, be it the sacred Flower Wars of Mesoamerica, in which captives were sought for sacrifice to various deities, or the warfare practiced by the steppe nomads of Central Asia, which was noted for such a level of brutal skill and daring that relatively small armies of Turco-Mongol horsemen were able, on several occasions, to topple or at least shake to their foundations mighty empires.

Two of the greatest, but certainly not the only, "Thunderstorms out of the Steppe" during these centuries were the campaigns of the Mongols (ca. 1209–ca. 1279) and the conquests of Amir Timur-i Leng (Tamerlane), which spanned the period 1370–1405. Both onslaughts resulted in millions of deaths.

Even Song China (960–1279) engaged in defensive and offensive wars, and this was an empire that was largely guided by an educated elite who accepted, at least in theory, the Confucian principles that war is an abandonment of reason and that soldiers must be placed low on the social scale, somewhere around the level of prostitutes. Indeed, to maintain peace along the frontier, earlier dynasties had often opted to negotiate with their so-called barbarian neighbors and even were willing to bribe them, but always under the cloak of gift exchange. Even so, imperial China had always maintained large armies, and throughout the centuries it used them frequently. So it was with Song China. A desire to recover northern China from the Khitans (Qidans) led Emperor Huizong to ally in 1125 with the so-called Wild Jurchens (Ruzhens) out of Manchuria. The Jurchens, however, proved just too warlike, and after defeating the Khitans, they overran the north for themselves, driving the imperial Chinese court southward to Hangzhou in 1127. The Southern Song court largely followed a nonaggressive policy for the next century, but then it and the Chinese of the south put up a spirited 27-year-long defense against the Mongols before succumbing in 1279. After the Ming

restored native rule in 1368 by means of a bloody revolution, it initially promoted campaigns along its northern border, although later it came to rely more heavily on a new static defense, the Great Wall. Even the fleets of Zheng He, which sailed through the waters of the Indian Ocean in the early fifteenth century, intervened militarily in regional affairs in coastal Southeast Asia as part of the Ming court's overall diplomatic goal of reestablishing a tributary relationship with the rulers of this region.

Japan's warrior class, the samurai, defeated combined Mongol-Korean invasions of Japan in 1274 and 1281. Although aided by the weather on both occasions, the samurai were probably the deciding factor each time. Bushido, "the Way of the Warrior," a code that celebrated the samurai who joined martial virtues, such as loyalty, valor, and skill at arms, to a cultivated mind and disciplined spirit, became a widespread ideal during these centuries. Zen, a form of meditation that Buddhism imported from China, became one of the major means by which a samurai reached a high state of physical, mental, and moral discipline. One so trained would, as was said of Kusunoki Masashige (d. 1333), "scheme in his tent to defeat an enemy 1,000 leagues away." But when artful ploys and military skill proved insufficient, samurai such as Kusunoki were expected to meet death rather than to surrender in defeat, as he did.

Half a world away another warrior class, Western Europe's feudal knights, were developing their own code of conduct—Chivalry—a set of values theoretically unique to the chevalier, or mounted warrior. In the eleventh century when this code began to be articulated, the ideal warrior was essentially only a brutally effective and loyal soldier. By the mid-thirteenth century he had evolved, at least in theory, into a hereditary gentleman who was also a brave and loyal warrior. Added to this was the concept of the warrior of God, or the knight as the vassal of Jesus Christ. This new warrior emerged in the twelfth century in the context of the crusades. Ironically, the crusades had grown partially out of the tenth- and eleventh-century Peace and Truce of God movements, which had been aimed at lowering the level of violence in Western Christendom. As far as Latin Christian contemporaries were concerned, the finest warriors of God were members of the military orders, such as the Templars, who lived in religious communities but carried out military functions in defense of Christendom.

American elite warriors were equally acknowledged as belonging to a special class. In Mesoamerica the finest warriors, who were noted for their ability to take captives in war, belonged to a hierarchy of warrior societies, each distinguished by its dress and place in battle, with the members of the most-honored societies, such as the Aztec empire's Otomi-class warriors, having the most elaborate feather battle costumes. In South America bejeweled gold and silver statuettes of warriors were a common item, apparently crafted as a way of honoring the warriors who had, in such a short space of time, created by conquest the Inca empire.

Most soldiers during these five centuries employed traditional hand and projectile weapons that long predated the year 1000. The exception was gunpowder weaponry: firelances, bombs, mines, cannons, and firearms. In the hands of the Chinese, the Mongols, and even Western

Ironically, the crusades had grown partially out of the tenth- and eleventh-century Peace and Truce of God movements, which had been aimed at lowering the level of violence in Western Christendom.

Europeans, they proved effective at times, especially during sieges, but their revolutionary impact on land and sea would only begin after 1500.

In summary, the arts of war and diplomacy during this half millennium were hardly balanced. War was a much more common phenomenon than negotiation, although even the most rabid enemies could and did enter into treaties when it suited their needs.

■ Introduction: The Ideology of War and Peace

Except for certain religious sects, such as the Jains of India who taught and largely practiced *ahimsa*, or absolute nonviolence, and some but far from all Hindu and Buddhist groups, as well as certain radical thinkers and their followers, most persons on the face of the earth during this 500-year period thought of war as a natural human enterprise and malady and did not entertain any theory of an achievable permanent peace on earth. Ending war was probably as unimaginable to them as stopping the daily rising and waning of the sun. One exception to this rule were Christian millenarists who, following the New Testament's Book of Revelation, believed that Jesus's Second Coming would usher in a thousand-year period of peace and prosperity followed immediately by the End of Time. But this final peace on earth would be the product of a cataclysmic battle between the forces of Good and Evil, and although humans would serve as agents of God in this last struggle, that peace would be generated at an indeterminate time decided by God alone. Meanwhile life was a constant battle, both metaphorical and physical. This included the scourge of war.

Because armed violence was such a constant plague on human society, there were some attempts to at least mitigate its evils and even convert war to religious purposes. The most strikingly new, even revolutionary, example of such endeavors was Latin Christian Europe's Peace and Truce of God and, far more spectacu-

larly, the crusades. Ironically, the crusades, which developed in part out of the Peace and Truce of God movements, turned out to be especially brutal and bloody scourges on much of Europe and the Middle East, especially the eastern lands of the Mediterranean. As the several excerpts on these related movements demonstrate, the Roman Church taught that violence improperly exercised on protected persons, or within sacred precincts, or during prohibited periods of time was a damnable act that imperiled the perpetrator's immortal soul. To the contrary, warfare waged against enemies of the Faith or the Church and sanctioned by that Church was potentially a salvific act. It was even a quasi-sacramental act, and the holy warrior enjoyed special protected and honored status.

Much earlier, Saint Augustine of Hippo (354–430) had provided Latin European civilization with the notion of the just Christian war, a war fought dispassionately and even as an act of charity on behalf of reestablishing peace. Western theologians during the thirteenth century, especially Thomas Aquinas, continued to refine this theory, which has continued to influence Western attitudes toward war—or at least justifications for war—into the twenty-first century.

The Eastern Christian churches, such as those of Byzantium or Ethiopia, never articulated such a clearly delineated ideology of holy war as the Latin Christian crusade, although each revered its protector warrior saints such as George, who

was universally honored by the Ethiopian, Byzantine, other Eastern Orthodox, and Roman Churches. Moreover, the Ethiopian and Byzantine empires were founded upon the assumption that any wars waged by their respective God-anointed emperors in defense of their sacred empires were *ipso facto* holy and just. After all, the emperor was the deputy of God on earth. Wars waged against Muslim neighbors by Ethiopia's emperor Amda Seyon (r. 1314–1344) were certainly presented as just and holy in the *Kebra Negast* (*Book of the Glory of Kings*), a chronicle that was probably crafted during his reign to legitimate his Solomonid dynasty (1270–1975). The Byzantine empire rarely declared anything even approaching a Latin-style crusade. Two exceptions were when the emperors- and patriarchs-in-exile at Nicaea called for throwing out the hated Latin empire of Constantinople (1204–1261), which had been established in the wake of the Fourth Crusade, and, ironically, when its emperors issued pleas for Western crusaders to rally to the cause of an empire besieged by Ottoman Turks in the fourteenth and fifteenth centuries.

The theoretical underpinnings and juridical rules governing the complexities of jihad in the way of God, namely Islamic holy war against unbelievers, had been established well before the year 1000. During this half millennium jihads continued to be proclaimed by *ghazis* and *mujahidin*, especially Turkic ghazis, whether they were struggling against crusaders and Latin colonists in Syria-Palestine or invading the lands of Dar al-Harb (The House of War), which were any lands ruled by non-Muslims. The ghazis who swept into India out of Afghanistan certainly saw and presented themselves as righteous jihadists. So far as the rules of proper jihad conduct were concerned, as is always the case in war, it all depended on who was interpreting the rules and acting accordingly.

Even when followed scrupulously, the rules for warfare in Afro-Eurasia allowed a high degree of violence against combatants and non-combatants alike. Throughout Eurasia and North Africa, for example, it was generally accepted as a norm of war that any city or fortification that resisted its besiegers left itself vulnerable to the inevitable three days of unrestricted plunder allowed the conquering army. It was not only pun-

ishment for failure to capitulate peacefully but was also payment to the warriors for the dangers they had faced. The Mongols carried this to an even greater degree by putting the entire populations of resisting cities to the sword, an effective means of ensuring the capitulation of those who heard of these massacres. When the army of the Fourth Crusade captured Constantinople in April 1204, its leaders attempted to force the crusaders to put all plunder into a common hoard for equal distribution according to rank and status. Even though a few soldiers who violated this order were executed publicly, an estimated half of the plundered treasure was secreted away. The numbers of killings and rapes that were visited upon the populace of Constantinople during these three days can only be guessed at.

Ritualistic combat, which assumed importance within many societies in America, sub-Saharan Africa, and Oceania, often preserved noncombatants from such violence. As far as modern students of history are concerned, the most well known of these ritualistic forms of combat were the so-called Flower Wars as practiced by numerous cultures in Mexico and beyond. Their purpose was to capture a suitable number of courageous enemy warriors for sacrifice to a city's deity. Often these captives would be sacrificed in an act of symbolic combat in which they "battled" a fully armed warrior while armed only with token weapons. So far as worldwide ritualistic combat was concerned, the Flower Wars were a rare phenomenon. More commonly, ritualistic combat's purpose was to establish or reestablish harmony through limited conflict or to provide young men with an opportunity to prove their manhood. Moreover, wherever war was ritualistic, it rarely included large-scale killing on the battlefield or the seizure of lands. In many ways, therefore, some forms of ritualistic war can be interpreted as the means of securing and even maintaining peace or, at least, putting limits on violence.

—Alfred J. Andrea

Jihad

The word "jihad" comes from the Arabic root *ja-bada*, meaning "to exert an effort" or "to strive" toward a goal, and the term is often used in the

➤ RULES OF THE LESSER JIHAD

An account demonstrating the rule that jihad of the sword is not allowed for the sake of hatred or blind revenge is found in Book I of the *Mathnawi* by the Sufi mystical poet Jalal al-Din Rumi (d. 1273) and relates the actions of Ali ibn Abi Talib (d. 661), the nephew and son-in-law of the Prophet Muhammad. In hand-to-hand combat during a battle in the early days of Islam, Ali overpowered his enemy and threw him to the ground. As a last act of hatred, the opposing soldier spat in Ali's face. At that point, Ali got up, put away his sword, and refused to kill the man. The enemy soldier expressed surprise and asked Ali why he did not kill him. Ali answered that previously he had been fighting for the truth (*al-Haqq*) of Islam, but when the soldier spat in his face, he had become angry. Remembering the rule that fighting for the sake of hatred or revenge is not allowed, Ali stopped himself and refused to kill the soldier. The account concludes by saying that Ali's actions so impressed the enemy warrior that he immediately converted to Islam.

—April L. Najjaj

Muslim world in several different ways. Indeed, in the Middle East, “jihad” is often used in social or economic contexts, similar to the West where politicians or newspapers speak about waging a crusade against poverty, homelessness, or illiteracy. The Muslim use of the word “jihad,” however, is often misunderstood in the West, and the common English translation of it as “holy war” is overly simplistic and emphasizes only one of several different aspects of this word.

In its most basic sense, there are two different kinds of jihad: *al-jihad al-akbar* (the greater struggle or effort) and *al-jihad al-asghar* (the lesser form of struggle). The greater jihad refers to the internal struggles that all people deal with on a daily basis to be good and honest and to obey the laws of God. The difficulties of living a morally upright life when faced with the world's constant temptations is the most common use of the term “jihad” in the Islamic world; such a struggle between doing good and avoiding evil is a concept common to all religious traditions and is not unique to Islam.

On the other hand, the lesser jihad refers to the outer, and at times military, struggle in defense of the true religion, Islam. Just as often, if not more so, the outer, or lesser, jihad can involve simply preaching the faith to unbelievers. But when jihad involves military action, not just anyone can declare what can also be referred to as a jihad of the sword, and there are strict rules for waging such military efforts. At times, the term has been used freely by individuals in the Muslim world who have no authority to declare a jihad but attempt to use religious terminology as a rallying point in furtherance of their own secular political or military agendas, such as Saddam Hussein's declaration of a jihad against coalition forces invading Iraq in 1991. In addition, suicide bombers often describe themselves and are reported by the media as waging jihad; however, taking one's life is forbidden in Islam, just as in Christianity, and thus such incidents should not be considered within the context of struggle for the sake of the religion but rather as an expression of political, social, and/or economic disenfranchisement.

A jihad of the sword can only be declared or sanctioned on the basis of a religious authority, such as a widely recognized Muslim scholar or judge. Modern-day scholars in both the Sunni and Shia traditions agree that such a jihad is only permissible for the purposes of defense. In addition, the lesser jihad is never waged to force conversion to Islam, for Surah (Chapter) 2:256 of the Quran allows for freedom of religion and is translated as saying that “There is no compulsion in religion.”

The religion of Islam spread throughout the Arabian Peninsula and far beyond in the seventh and eighth centuries, eventually extending from Spain and Morocco in the West to as far as northwest India in the East by roughly 750. These early centuries witnessed frequent warfare, and the rules established by the religion in governing the conduct of warfare became an effort to exercise some control over these ongoing conflicts. These same rules apply to the exercise of jihad and can be found not only in the Quran but also in the Hadith (the recorded sayings and actions of the Prophet Muhammad) and eventually were incorporated into the corpus of Islamic law. For example, warfare is to be limited to com-

batants only, and it is not permissible for Muslims involved in any kind of warfare to kill women (except when they take up arms against Muslim armies), children, the elderly, or the injured; to torture or otherwise humiliate prisoners of war (although they can be killed in certain circumstances); or to destroy places of worship, crops, trees, or livestock. In addition, there is a code of honor and behavior that all Muslims must follow that clearly outlines treatment and exchange of prisoners, avoidance of blind revenge or retaliation, and insistence on mandatory peace negotiations at the enemy's request. Moreover, the jihad must be openly declared, and the enemy must first be given the opportunity to convert to Islam before an attack can be launched.

An example from Islamic history when the lesser jihad, or jihad of the sword, was properly employed for the defense of the religion and proclaimed openly through the appropriate channels can be seen in the wake of the First Crusade. Refugees from Jerusalem, which had been captured and sacked in 1099, fled to Damascus and appeared before the grand *qadi* (religious judge) of Damascus, Abu Saad al-Harawi, to relate what had happened to the third-holiest city in Islam. The grand *qadi* then traveled to Baghdad to inform the Abbasid caliph, al-Mustazhir Billah (r. 1094–1118), of these events, and the proclaiming of a jihad against the European invaders soon followed. Although it would take approximately another 50 years for Muslim armies to begin to mount an effective counterattack against the European crusaders, this call for jihad is considered to be the first act of resistance in defense of Islam and its holy sites in Jerusalem during this period.

Rumi—Sufi Apostle of Love

The thirteenth century was marked by crusades and jihads of the sword, yet that same age also produced several apostles of love and peace. The story of the Christian saint Francis of Assisi (ca. 1182–1226) is well known in Europe and America. The fame of the Muslim Sufi saint Mevlana Jalaluddin Rumi (1207–1273) is gaining equal status in the West; in the Islamic world he has been one of the most widely beloved, read, and quoted poets for over 700 years.

Known in the West as “Rumi,” he is known among Persian speakers as “Mawlawi” and among Turks as “Mevlana.” The name “Rumi” signifies that he lived in Turkish Anatolia, which the Seljuk Turks called Rum, meaning “the land of the Romans,” signifying that they had conquered the territory from the East Roman, or Byzantine, empire in the eleventh century. His titles “Mawlawi” or “Mevlana” mean “our master.” By whatever title, this Sufi holy man and poet is recognized as one of thirteen-century Islam’s preeminent advocates of an ecumenical love that mirrors God’s love for all humanity.

Rumi was born on September 30, 1207, in Balkh (modern Afghanistan). In 1208 his father, a scholar and Sufi sheikh, moved the family to Samarqand. Anticipating the encroaching Mongols, they continued to Baghdad, Mecca, Damascus, and Konya in Anatolia, where they settled by 1229. Here Rumi prepared to succeed his father as a teacher. Since Rumi was only 24 years old when his father died in 1231, he asked one of his father’s students to serve as his spiritual director. After studying the Quran, Hadith (traditions regarding the actions and sayings of the Prophet and his Companions), Hanafi law, and theology in Aleppo and Damascus, Rumi returned to Konya in 1237 and taught in Konya’s *madrasas*.

Rumi was transformed by his relationship with Shamsuddin Tabrizi (whose name means “sun of the faith from Tabriz”), who became Rumi’s spiritual guide, intimate friend, and poetic muse, beginning in 1244. Shams was a scholar of Islamic jurisprudence, logic, math, and astronomy. Eccentric and iconoclastic, Shams emphasized that following the Prophet Muhammad’s exemplary precedent meant sharing his mystical experiences, including the heavenly ascension.

➤ THE GREATER JIHAD

Hadith records that upon returning from a military expedition against Mecca, the Prophet Muhammad told his companions: “We have returned from the lesser Jihad to the Greater Jihad.” In his *Masnevi-i Manavi* (also known as the *Mathnawi*), a massive work of spiritual stories and poems in Persian whose title translates as *Rhyming Couplets of Profound Spiritual Meaning*, Rumi explains the meaning of this story.

“O kings, we have slain the outward enemy, (but) there remains within (us) a worse enemy than he.

To slay this (enemy) is not the work of reason and intelligence; the inward lion is not subdued by the hare.

This carnal self is Hell, and Hell is a dragon (the fire of) which is not diminished by oceans. . . .

When I turned back from the outer warfare, I set my face towards the inner warfare.

We have returned from the lesser Jihād, we are engaged along with the Prophet in the greater Jihād. . . .

Deem of small account the lion (champion) who breaks the ranks (of the enemy): the (true) lion is he that breaks. . . himself.”

—Alfred J. Andrea

Source

The Mathnawí of Jalálu'dín Rúmí, 8 vols., translated by Reynald A. Nicholson (London: Printed by Cambridge University Press for the Trustees of the “E. J. W. Gibb Memorial,” 1925–1940), 2:76.

Rumi's passionate love for Shams transformed him from a scholarly sheikh into an ecstatic poet of passionate spiritual love. Rumi experienced Shams as the perfect human being and divine beloved; Shams regarded Rumi as a spiritual guide worthy of sainthood. Either in response to the jealousy of Rumi's disciples or as part of their training together, Shams left for Syria in 1246. Though returning briefly in 1247, Shams again disappeared, initiating Rumi's poetry of intense longing for reunion. Although hagiographic accounts narrate that seven of Rumi's jealous disciples murdered Shams in 1247, textual and

historical evidence suggests that Shams might have died while returning to Tabriz.

Shams taught Rumi a form of “whirling” meditation using poetry, music, and movement to reach ecstasy, which became for Rumi the perfect expression of love for God. Rumi and his followers, the Mevlevi Brethren, men following a semimonastic form of spiritual life while fully engaged in secular professions and generally also married with families, became known popularly as Whirling Dervishes because of this distinctive form of meditative prayer. On his part, Rumi composed and dictated poetry while engaging in this ecstatic activity. In 70,000 lines of verse and a volume of discourses, Rumi evoked the beauty and power of passionate love over reason, the heart over intellect, and silence over words.

When Rumi died on December 17, 1273, Jews, Greek and Armenian Christians, and Turkish and Arab Muslims followed his funeral procession and honored him in a display of ecumenical spirit that still surrounds him and his order. His mausoleum (the Green Dome) at Konya today attracts more than 500,000 pilgrims of every faith annually and remains the center of the Mevlevi Order. In like fashion, the tomb of Francis at the Sacro Convento in Assisi is a focus of ecumenical pilgrimage on a massive scale and the center of the Conventual branch of the Order of Friars Minor (the Franciscans).

Mongol Justification of War

Despite the stereotype of bloodthirsty, ravaging barbarians, the Mongols justified their wars in more complex ways than just a desire for plunder. Chinggis Khan's invasions primarily began out of a desire to protect his new state in Mongolia and for revenge rather than in any attempt to conquer the world. As several steppe leaders fled from Mongolia during the wars of unification (1189–1206), Chinggis Khan pursued them into the kingdom of Xia, or Xixia (present-day Ningxia in China), and into western Siberia and Kazakhstan. This prevented them from rallying their defeated tribes and attempting to overthrow Chinggis Khan, a very real possibility. The invasion of northern China in 1211 served not only to limit Chinese influence in the steppe regions, because China had traditionally attempted to control and expand its steppe borders in order to keep strong non-Chinese states from rising there, but Chinggis Khan also sought to avenge past Chinese transgressions against the Mongols committed by the Jin empire, which was then located in northern China.

Revenge also factored in a number of other wars. In 1218 the Khwarazmian governor of Otrar massacred a Mongol-sponsored caravan. The Khwarazmian ruler, Muhammad II, refused to turn the governor over to the Mongols and then killed the Mongol envoy. Unlike in many of the sedentary states of Eurasia, nomads considered the safety of messengers sacrosanct. By killing the envoy, the offender not only violated this taboo but also brought dishonor to the Mongol ruler. As a result, the only way to restore honor was by avenging the death.

By the reign of Ogedai Khan (r. 1230–1240), the Mongols had adopted the idea of divine right of conquest. Although this idea is often attributed to Chinggis Khan, Ogedai is the one who carried it out. In short, Tenggri (Heaven) decreed that Chinggis Khan and his sons should rule the world. Those who did not submit were therefore in rebellion against the will of Heaven. Before invading, the Mongols asked for

➤ MONGKE KHAN'S LETTER TO LOUIS IX

In 1253 the Franciscan William of Rubruck set off for the land of the Mongols to preach the Gospel. Although he enjoyed the support of King Louis IX of France, Friar William was scrupulous in not presenting himself as the king's diplomatic envoy. Nevertheless, prior to his return to the West, William was entrusted with a letter to Louis from Mongke Khan. Its tone and message reflected the shift in ideology that had taken place under Mongke's predecessor Ogedai.

"This is the mandate of the eternal God. 'In Heaven there is only one God eternal; on Earth there is only one lord, Chinggis Khan. . . .' We have revealed to you the mandate of the eternal God. Once you have heard and believed it, if you are willing to obey us, send us your envoys. In this way we will know for certain whether you wish to be at peace with us or at war. When, by the power of God eternal, the entire world, from the rising of the sun to its setting, has become one in joy and peace, then it will become apparent what we are going to do. If, however, after hearing and understanding the decree of God eternal, you are unwilling to acknowledge or believe it, and say 'Our country is far away, our mountains are mighty, our sea is vast,' and, with this confidence, you make war upon us—how can we know what will happen? He, God eternal, who has made what was difficult easy and made what was distant near—He knows!"

➤ CHINGGIS KHAN'S LETTER TO CHANGCHUN

In 1219 Chinggis Khan sent an invitation to the Chinese Daoist sage Changchun (1148–1227) to travel to his court to instruct the Mongol khan in the Way. Chinggis Khan was not so much interested in wisdom as in the secret of immortality, which he presumed the monk possessed. Although Changchun claimed no such knowledge, he eventually reached the Mongol leader in Afghanistan in May 1222, where he lectured the khan on leading a life of moderation and abstinence. Ironically, both men died in 1227.

In the prologue to his letter of invitation, the Great Khan explained how he had carved out his empire. The first reason that he offered—China's having lost the Mandate of Heaven and his having gained it because of his virtue and wisdom—was completely Confucian and suggests the work of a Chinese counselor.

“Heaven has abandoned China owing to its arrogance and extravagant luxury. But I, living in the northern wilderness, do not have inordinate passions. I have only one coat and one food. I eat

the same food and am dressed in the same rags as my humble herdsmen. I consider the people my children and take an interest in talented men as though they were my brothers. We always agree in our principles, and we are always united by mutual affection. At military exercises I am always in the forefront, and in battle I am never in the rear. In the space of seven years I have accomplished a great work, uniting the whole world in one empire. I do not myself possess extraordinary qualities. However, the regime of the Jin is inconstant, and therefore Heaven assists me in obtaining the Jin throne. The Song to the south, . . . the XiXia to the east, and the barbarians in the west, have all acknowledged my supremacy. It seems to me that such a vast empire has not been seen since the remote time of our ancestral khans.”

Western Europe—The Peace and Truce of God

In the Peace and Truce of God movements, medieval ecclesiastics attempted to restrain aristo-

cratic violence. The Peace of God councils prohibited violence against the persons and property of ecclesiastics and the peasantry, while the Truce of God generally prohibited violence during days of significance to the Church, such as feast days of saints, Advent and Lent, and Thursday to Sunday. The movements were also expressions of the growing power of the Church as a major property holder that sought to protect its own interests and expand its authority over the laity.

The earliest evidence for the Peace of God movement comes from late-tenth-century Aquitaine and Burgundy. In 975, Bishop Guy assembled a diverse group of people, including clerics, monks, nobles, and peasants, in a field at Le Puy to discuss the imposition of the Peace, and Archbishop Gumbald of Bordeaux did the same in 989–990 in Charroux. During these councils, they proclaimed that acts of violence against members of the clergy or peasants and theft of Church property or peasants' livestock were offenses punishable by excommunication. By protecting the peasantry, the Church fulfilled its pastoral obligations while also protecting its tithing revenues. After denouncing violence against these targets, the councils then called upon lay lords to swear oaths to honor the Peace. In order to highlight the importance of these councils, ecclesiastical organizers brought the relics of local saints. The saints' presence was guaranteed to bolster the participation of the laity, and they also served as heavenly witnesses to the oaths.

Beginning in the 1040s, the Peace of God was augmented by the Truce of God, which sought to restrict aristocratic violence to certain times. This change was significant because it called into question the morality of aristocratic violence; if violence against Christians was inappropriate during Christian holidays, then it was perhaps also blameworthy at all times.

While details of the Peace and Truce of God councils are evident in the extant records, historians continue to debate their impetus. The debate revolves around their place in the so-called Feudal Revolution. Some scholars argue that the movements were necessary because of the growing violence of the aristocracy following the dissolution of Carolingian public authority in the tenth century. Others, however, contend that the

➤ A TRUCE OF GOD PROCLAMATION OF 1035–1041

During the period 1035–1041, Archbishop Reginald of Arles and several other high-ranking ecclesiastics of France composed the earliest extant proclamation of a Truce of God. In it, they call upon Italian clerics to join them in denouncing violence on days of the week connected with Christ's Passion, namely from Wednesday night to Monday morning, so that "all persons may have peace, and, trusting in this peace, may go about their business without fear of their enemies." In order to facilitate compliance, the proclamation offers absolution of sins as a reward for those who honor the Truce, and it threatens those who violate it with excommunication and anathematization.

—Kate McGrath

movements did not so much reflect the growing violence of the nobility but instead reflected the growing power of the Church and its competition with the nobility for control of property and authority over the peasantry. While the reasons behind and meaning of the initial development of the movements will likely continue to be debated, it is clear that they had a profound effect on medieval society. Pope Urban II was able to use their rhetoric in his call for crusade in 1095 to promote participation in the campaigns to capture Jerusalem. Moreover, the language of the movement had a certain resonance with the nobility's own development of standards for the use of violence, better known as the code of chivalry.

Christian Warrior Saints

Warrior saints were universally popular in the Latin West in the age of the crusades, but their cults were equally strong within the churches of Eastern Christendom, where their veneration stretched back into Christianity's early centuries.

All Christian saints—persons whose lives of heroic sanctity earned them passage into Heaven and veneration as special friends of God and protectors of those who pray for their help—are metaphorically *milites Christi* (soldiers of Christ), inasmuch as they successfully battled the forces

of Evil and their own sinful appetites while on earth. A few saints, however, had served as soldiers while they were alive and were believed to have retained their martial qualities while serving as heavenly helpers.

In one of the most dramatic moments in the First Crusade, on June 28, 1098, a starving crusader army launched a counterattack against a numerically superior force besieging it within the city of Antioch. According to the *Gesta Francorum* (*The Deeds of the Franks*), an important eyewitness account of the battle composed by an anonymous Norman-Italian soldier, as the crusaders marched out to meet the enemy, they saw a countless host of warriors on white horses riding down from the mountains. At first confused, the crusaders soon realized that this was a heavenly host led by Saints George, Mercurius, and Demetrius, coming to their aid. Thus emboldened, the crusaders routed the enemy.

One can find many non-miraculous explanations for this morale-boosting phenomenon, but there is no denying that the crusaders believed in these warrior saints, the greatest of whom was Saint George. Eastern Christians had had a long, strong, and widespread devotion to the soldier-saint known as George, whom they venerated as an early-fourth-century martyr from Anatolia. Although the cult of Saint George had found its way to the West by the sixth century, the saint's popularity rose appreciably during the age of the crusades, as he and similar warrior saints became identified with holy war against Islam. The *Golden Legend*, a mid-thirteenth-century Latin collection of saints' stories, recounts the tale of a handsome young man who appeared to a crusader priest and identified himself as George, captain of the Christian host. He promised to accompany the army to Jerusalem, where they would carry his relics. Later during the assault on the city, as the crusaders hesitated to climb their scaling ladders, George appeared in white armor marked with a red cross and led them safely over the walls to victory. By the late Middle Ages, George was the patron of such kingdoms as Aragon, England, Germany, Hungary, Lithuania, and Portugal. Additionally, a large number of principalities and cities throughout Europe adopted George as their heavenly protector. Italy alone had one hundred and eighteen

› SAINT MAURICE

Visitors to the Cathedral of Saints Maurice and Katharina in Magdeburg, Saxony are often surprised to see a mid-thirteenth-century statue of a black African in full Western chain-mail armor standing guard near the tomb of Emperor Otto I. Indeed, it is generally assumed to be the first artistic depiction of an ethnic African in central Germany. The knight is none other than Saint Maurice (originally, Mauritius), patron of the cathedral. As understood in Roman antiquity, the Latin word *Mauritius* meant "black African" or "Moor," which might suggest that Mauritius (or Maurice or Moritz, as in St. Moritz, Switzerland) was a composite person of legend rather than a single individual. Whatever the truth, according to tradition, Mauritius, an Egyptian from Thebes, commanded the Theban Legion, which was (according to an unreliable legend) composed entirely of Christians. Ordered by Emperor Maximian (r. 285–310) to attack Christians in present-day Switzerland, the legion, bolstered in its resolve by Mauritius, refused to comply. Consequently, Mauritius, along with the entire legion of 6,666 men, was martyred at a site known today as Saint Maurice-en-Valais.

In 961, Otto I, king of Saxony (r. 936–973) and future Western emperor (r. 962–973), transferred Mauritius's body to Magdeburg, where it resided as the patron not only of the newly created cathedral (which was rebuilt after being destroyed in 1207) but of Otto's kingdom and empire. The warrior saint's presumed sword and spurs (a rather anachronistic touch) served as imperial insignias in the subsequent coronations of Western emperors.

—Alfred J. Andrea

communes, or independent cities, that carried George's name.

Joining George in this heavenly army of warrior saints venerated in the West were such early soldier-martyrs as the aforementioned Demetrius and Mercurius, as well as Maurice, Sebastian, Theodore, and Victor. Of these, Theodore, Sebastian, and Maurice were the most popular, although none probably reached the level of George's popularity.

In the East, military saints were legion in numbers. Demetrius and Theodore were especially popular. Demetrius, an officer in the Roman army who was beheaded in 303, served as the patron saint of Thessalonica (present-day Thessaloniki), the site of his martyrdom and the second most populous and important city in the Byzantine empire. Saint Theodore, known as Theodore the Great or Theodore the General, was equally revered by Byzantine and Ethiopian Christians, being prominently featured in the religious art of both traditions. When depicted on horseback by Ethiopian artists, Theodore was always astride a distinctive red horse. Theodore was also revered by Armenian Christians, who dedicated February 24 as his feast day. As Constantinople's fortunes faded in the thirteenth century and following, in the face of a host of determined enemies, the cult of these warrior saints rose appreciably in volume within the Byzantine Church. Two of the more popular heavenly warriors whom the Byzantines vainly implored for help were Sergius and Bacchus, two early-fourth-century soldier martyrs from Syria. Of course, the various Syrian branches of Christianity revered these two warriors and looked to them for aid, as did Egypt's Coptic Christians. Needless to say, the Byzantine cult of military saints passed to the various Slavic peoples who adopted Constantinople's form of orthodox Christianity. Sergius and Bacchus, as well as Theodore, George, and a host of other soldier saints are prominent in Slavic icons, especially Russian holy pictures.

One of the Latin West's most revered heavenly warriors—Saint James the Greater, an apostle of Jesus—had never been a soldier on earth but assumed in legend and cult the status of a saint who assured victory in holy war and protected those who waged such wars. Indeed, he

was metamorphosed into *Santiago Matamoros* (Saint James the Moor-Slayer), the patron saint of the Reconquista, who fought to protect both his relics, which lay in Compostela in northwestern Spain, and the Christians who revered them. It was claimed that he could be seen in the heavens at crucial moments in battle, as Christians fought Moors in Iberia, sitting astride a white horse and carrying a drawn sword and flowing banner. Invariably, so the legends had it, such apparitions assured a Christian victory. Legend further maintained that Santiago's role as a warrior commenced in 844 at the Battle of Clavijo (which probably was never fought), where he suddenly appeared and killed thousands of the Moorish enemy. Significantly, "¡Señor Santiago!" became the battle cry of the Order of Santiago, a religious military order founded in León in 1170. Not only did the order become one of the cutting edges of the Iberian Reconquista, a significant number of its members, including Hernán Cortés, later served as conquistadores in the Americas, where they called upon their saintly patron for aid as they battled presumed heathens.

Islam's Counter-Crusade Ideology

When European crusaders arrived on the coast of what is today Turkey in the late eleventh century and traveled south to Syria-Palestine, the area had been in disarray for decades. Although it was nominally ruled by the Abbasid caliph farther east in Baghdad, local competing Turkish dynasties had served as de facto rulers throughout the region.

Since the coming of Islam in the seventh century, Jerusalem, a city holy to Jews and Christians for centuries, had taken on a similar role for Muslims, third in importance only after Mecca

Battle between Muslims and Crusaders, miniature from the Roman de Godefroi de Bouillon, 1337. (The Gallery Collection/Corbis)

➤ IBN AL-ATHIR—MUSLIM CHRONICLER OF THE CRUSADES

One of the most important chroniclers of the Muslim perspective on the crusades was Izz ad-Din Ibn al-Athir (1160–1233), an Arab of Mosul in Iraq and author of *Kamil al-Tawarikh* (*The Collection of Histories*), which considers Muslim world history from the pre-Islamic period until only a few years before his death. In an age characterized by continuing warfare between the Franj (Western, or Latin, Europeans) and Muslim forces in the Levant, Ibn al-Athir not only wrote about the momentous events in the eastern Mediterranean but also considered Christian warfare against Muslims in other lands, beginning with his coverage of battles in Al-Andalus (Islamic Spain) and the Norman invasion of Sicily (1061–1091), all of which he viewed as parts of a single concerted attack on Islam by Christendom. With this perspective, he presented the Muslim reaction to Christian aggression as justifiable defensive jihad. Likewise, he saw Muslim responses to the Mongol threat from the east in the early thirteenth century in the same light.

—April L. Najjaj

and Medina in the Arabian Peninsula. There is an account in Surah (Chapter) 17 of the Quran called *Al-Isra* (*The Night Journey*) that recounts what Muslims believe to be the Prophet Muhammad's miraculous overnight journey in 621 from Mecca to Jerusalem. Once he arrived in the city, the Prophet ascended to Heaven, considered a miracle in Islamic tradition and referred to in Arabic as *al-miraj*; and a shrine, known as the Dome of the Rock, would be built circa 690 over the site to commemorate the event. In addition, the Al-Aqsa mosque, part of an area in the old city of Jerusalem called Al-Haram al-Sharif (The Noble Sanctuary), was built about 710 by the Umayyad dynasty (661–750) and stands adjacent to the Dome of the Rock; the two sites together continue to be sacred to Muslims today.

With the crusaders' capture and pillaging of Jerusalem in 1099, Muslim refugees had headed eastward to Damascus and appeared before the grand *qadi* (judge) of Damascus, Abu Saad al-Harawi, to relate the events of the previous months. The grand *qadi* then traveled to Baghdad to inform the Abbasid caliph, al-Mustazhir Billah (r. 1094–1118), and the proclaiming of a jihad against the European invaders soon followed. Despite the religious significance of Jerusalem and the plight of the refugees, the weaknesses of the Abbasid caliphate together with the continuing warfare of competing local dynasties throughout the Islamic world would result in a delay of approximately 50 years before Muslim armies would begin to mount an effective counteroffensive against the European crusaders. The leadership of the governor of Mosul, Zengi (ca. 1127–1146), who used the rhetoric of jihad to encourage support, began the process with consolidation of his rule over Syria, at times allied with and other times fighting against the Frankish colonists who now ruled the crusader states, in part resulting in his conquest of Edessa in 1144. Only with the arrival of Nur al-Din (ca. 1146–1174), arguably the first true jihadist in this period who would set the model for future leaders, the most important being the son of one of his generals, Salah al-Din Yusuf al-Ayyubi (known in the West as Saladin, d. 1193), would the Muslim leadership be organized and begin to wage an effective counterattack that was motivated by jihadist ideology. Sunni Muslim forces

under Saladin's leadership conquered Egypt in 1169 and then moved to Syria to take Damascus (1174), Aleppo (1183), and Mosul (1186). With these victories, a united Syria and Egypt, still under the command of Saladin, moved against and defeated the forces of the Latin kingdom of Jerusalem at the Battle of Hattin in July 1187 and ensured the subsequent surrender of Jerusalem a few months later.

The Third Crusade (1188–1192) rewon some of the cities and territories lost to Saladin (most notably Acre and Jaffa but not Jerusalem), and three truncated but still vital Latin crusader states remained a presence along the coast of Syria-Palestine until the late thirteenth century. Finally, however, Mamluk jihadists, most notably Baybars (r. 1260–1277), Kalavun (r. 1279–1290), and al-Ashraf Khalil (r. 1290–1293), used the call for holy war to crush the last vestiges of Latin occupation in Syria-Palestine, with the final major crusader bastion, Acre, falling in 1291.

Malicide not Homicide— The Military Religious Orders of the West

Military religious orders (or simply the military orders) began to appear in the twelfth century in Latin Christendom as a fusion of the religious and military vocations. As such, they represented a new stage in the development of Christian thought both about war and also about the nature of the religious life. A few writers were skeptical about the possibility of combining these two vocations, but the majority of medieval Latin Christian thinkers approved.

The first military order per se was the Order of the Poor Knights of the Temple of Solomon (Templars), founded in 1120 by a handful of

knights who dedicated their lives to protecting pilgrims between Jaffa and Jerusalem. The Templars took religious vows of poverty, chastity, and obedience and were given quarters in the al-Aqsa mosque (which the crusaders identified as the site of Solomon's Temple) on the Temple Mount by King Baldwin II of Jerusalem. With Bernard of Clairvaux's support, they obtained a rule from the Council of Troyes in 1129. Thereafter they shouldered an increasing share of the defense of the kingdom of Jerusalem, acquiring castles and maintaining an extensive intelligence network throughout the region.

Another military order can claim an earlier foundation though not earlier militarization. The Knights of the Hospital of St. John of Jerusalem (Hospitallers) began existence as care providers at a hospice in Jerusalem for sick and injured pilgrims around 1080. By 1126 the Hospitallers had a constable-brother in charge of troops, and by the mid-twelfth century they too were playing an important role in the defense of the Kingdom of Jerusalem although they never abandoned their vocation of hospital work and maintained extensive, sophisticated hospitals in Jerusalem (and later in Acre and on Rhodes and Malta).

Members of military orders were not crusaders. Crusading required its own special vow. Having already taken religious vows, military order members were not free to take crusade vows. However, they usually played a significant role in major crusades; the Templars and Hospitallers shared responsibility for the vanguard and rear guard on campaigns, with each order taking an end of the column, and on numerous occasions provided a disciplined example that prevented a crusader army from disintegrating.

Military orders were generally "exempt"; that is, they owed their primary obedience directly to the papacy and were not under the control of local ecclesiastical authorities. This gave them considerable flexibility and strength but also attracted hostility from local authorities at times.

Both major orders developed extensive economic networks throughout the Latin Christian world, and the Templars seem to have been particularly adept at finance and banking. Popular opinion considered them to be wealthy, although most of the money that passed through their hands was swiftly spent; maintaining men and

➤ ST. BERNARD OF CLAIRVAUX, “IN PRAISE OF THE NEW KNIGHTHOOD”

Bernard of Clairvaux (1090–1153), the most influential Latin churchman of his day, played a seminal role in popularizing the Templars and laying a theological foundation for such holy warriors in his undated treatise *De laude novae militiae* (*In Praise of the New Knighthood*). Here he compares the sin of homicide with the virtuous act of malicide, the killing of evil.

“A new kind of knighthood seems recently to have appeared on the earth. . . . It indefatigably wages a twofold combat, against flesh and blood and against a spiritual host of evil in the heavens. . . . [W]ho would not consider this very worthy of great admiration, even more so since it has hitherto been unknown? Truly a fearless knight and secure on every side is he whose soul is protected by the armor of faith just as his body is protected by armor of steel. . . . Why should he fear to live or to die when for him *to live is Christ, and to die is gain?* . . .

The knights of Christ may safely do battle [for] their Lord, fearing neither the sin of smiting the enemy nor the danger of their own downfall, inasmuch as death for Christ, inflicted or endured, bears no taint of sin, but deserves abundant glory. In the first case one gains for Christ, and in the second one gains Christ himself. . . .

The knight of Christ . . . is God’s minister in the punishment of evil doers and the praise of well doers. Surely, if he kills an evil doer, he is not a man-killer, but, if I may so put it, an evil-killer. . . .

Yet this is not to say that the pagans are to be slaughtered when there is any other way of preventing them from harassing and persecuting the faithful; but only that now it seems better to destroy them than to allow the rod of sinners to continue to be raised over the lot of the righteous. . . .”

—Paul Crawford

Source

Excerpted from chapters 1 and 3 of St. Bernard of Clairvaux, *In Praise of the New Knighthood: A Treatise on the Knights Templar and the Holy Places of Jerusalem*, trans. Conrad Greenia (Kalamazoo, MI: Cistercian, 2000), 33–43.

castles in the eastern Mediterranean was ruinously expensive.

As a result of the Third Crusade, a third military order was chartered in 1198: the Order of the Knights of the Hospital of St. Mary of the Germans (Teutonic Knights), an order that followed Hospitaler practices in fusing care for the sick with military activity but adopted the Templar rule and recruited almost exclusively from German-speaking areas of Christendom. In the diminished Kingdom of Jerusalem that existed after 1187, however, this order never managed to achieve the prominence of the Templars and Hospitalers and began to look for fields of action elsewhere, assisting the king of Hungary with frontier defense in the 1220s and moving north into the Baltic region shortly thereafter.

In 1291 when Muslim forces destroyed the mainland crusader states in Syria-Palestine, the military orders lost their central commands, a significant percentage of their manpower, and, most dangerously, their reason for existence. Two of the three great orders found new missions. The Hospitalers took the island of Rhodes in the later 1310s and converted themselves into a naval power, continuing their battle to defend Christendom from Islam. The Teutonic Knights, after a short period of internal debate, withdrew most of their resources from the Mediterranean and focused their attention primarily on the Baltic region.

The Templars, however, attracted the hostile attention of King Philip IV of France. For reasons that are unclear and that historians have been debating ever since, he had them arrested and charged with heresy and gross immorality in 1307. In 1312 Pope Clement V suppressed them without finding them guilty, saying that their reputation had been so damaged that no decent man would want to join. Although that was probably true, the pope was almost certainly also seeking to defend the legal precedent that only a pope could discipline an exempt order of the Church. After 1312 the Templars ceased to exist as an organization despite an extensive later mythology that claims their survival into the present day and attaches various occult mysteries, unanimously rejected by professional historians, to their history.

The attempts of the Teutonic Knights and Hospitalers to redefine themselves were successful, however. The Hospitalers held Rhodes until the Ottoman Turks captured the island in 1522 and allowed them to leave with honor on January 1, 1523. The Hospitalers were then given the island of Malta by Emperor Charles V in 1530. In 1565 they survived a Turkish siege and remained on the island until driven off by Napoleon in 1798. Some decades of chaos ensued; they were reformed in the nineteenth century without their military functions. They exist today as the Catholic Sovereign Military Order of Malta (SMOM), a charitable organization and sovereign state, with its headquarters in Rome.

The Teutonic Knights set up an “order-state” in Prussia and Livonia, where they remained until the Reformation. At that time substantial elements within the order became Lutheran and evolved into the Duchies of Prussia and Courland. The order continued a reduced existence in Catholic countries such as Austria. In the twentieth century the Nazis appropriated to their mythology a distorted version of the memory of the Teutonic Knights while simultaneously persecuting its modern Catholic members. Today it survives as a purely religious order.

Other smaller military orders included the Order of St. Lazarus, which accepted knights with leprosy; the tiny Order of St. Thomas of Acre, almost exclusively English; the Spanish military orders of Alcantara, Calatrava, and Santiago; and a surprisingly large number of others. The popularity of this model led to the creation of monarchic orders such as the Order of the Sword and the Order of the Dragon, organizations patterned on the military order model but controlled by national monarchies rather than the papacy. As the model developed further in the secular world, these monarchic orders became loose societies and then mere decorations, awarded at the pleasure of the monarch.

American Indian War as Ritual

The native peoples of America certainly fought for economic gain, to take captives, to give valued status to young men, and to guard territorial boundaries. Beyond that, pre-Columbian Native American warfare had its religious aspects, though it was mostly not viewed as a conflict between religious belief systems. Native Americans were not usually out to change or destroy an enemy's religious precepts or to further a particular ideology. Rather, they fought to satisfy certain religious responsibilities and to maintain a healthy relationship with the spirit world.

One of the best examples of making war for the sake of fulfilling religious obligations was the Mexica Flower War. The Mexica, or Aztecs, had created an empire in central Mexico through war. Once they had established both political efficacy and religious orthodoxy, the Mexica constructed a hegemonic-tributary imperial system as opposed to one based on military occupation or the plantation of colonies. Non-Mexica subjects paid tribute to the central government but for the most part were not deliberately colonized.

The Mexica Flower War was fought to obtain captives for ritual execution and sacrifice to the Mexica deities. After ritual purification, a Mexica army issued a challenge to and took the field against a traditional enemy that had not yet been incorporated into the empire. Mexica military culture—indeed the military culture of all central Mexico—emphasized taking prisoners over killing enemies. The principal hand-to-hand weapon, for example, was a flat club lined with obsidian (glasslike volcanic stone) blades. This swordlike weapon was designed to inflict shallow

THE JAGUAR WARRIORS AND SACRIFICIAL COMBAT

Pictograph from the Florentine Codex by Juan de Tovar, sixteenth century. (Courtesy of the James Carter Brown Library at Brown University)

An Aztec Jaguar warrior engages in ritual combat with a tethered captive taken in a Flower War. The captive is armed only with a light shield and a wooden sword, the obsidian blades of which have been replaced with feathers. It was a form of human sacrifice that was intended in part to demonstrate publicly the martial capabilities of both the Aztec warriors and their enemies. The captive warrior had lived an honored life for a full year in his captor's house prior to the day of his ceremonial execution. He was perhaps viewed as a supreme sacrifice to the Mexica deities, especially if he had demonstrated extreme bravery in his final battle. After death he was decapitated, and his skull was put in a place of honor. He was also flayed, and his skin was worn by his captor.

—Tom Holm

wounds or to incapacitate a foe without killing. The most honored Mexica warriors were those who had captured the most prisoners in combat.

One form of Mexica ritual sacrifice emphasized the spiritual relationship among combatants, captives, and captors. A captive was adopted by his captor and taken in as a favored son for a period of about a year. The captive knew full well that he was to become a victim of ritual sacrifice—he was shown where and told how he would die—yet he stayed on with his adoptive family.

After a year the son/captive was taken to the temple of the war god, tethered to a raised platform, and forced to fight representatives from the various Mexica regiments. The victim was armed with a feathered war club, while his opponents carried their usual obsidian-bladed swords. He was never killed outright but was wounded over and over again with cuts from the extremely sharp obsidian blades until finally he dropped from exhaustion and loss of blood. He was sacrificed in this condition and his body flayed. The captor, who was an important witness to the ritual slaying and attended the ceremonies, was given the victim's skin, which he wore on his own person until it rotted away.

The macabre but intensely religious act of human sacrifice was not limited to the Mexica. Several of the nations of the eastern woodlands of North America practiced what has been called mourning war. Among these peoples, grief was understood as a disruptive and nearly uncontrollable force. The mourning wars amounted to the raiding of traditional enemies in order to replace dead relatives, physically and spiritually. The tribes of the Haudenosaunee, or League of the Iroquois, practiced this type of warfare in its purest form.

A widow or clan mother who sought to replace a deceased relative usually instigated the mourning war. An experienced war leader might then raise a party of warriors to raid a traditional enemy. If the raid was successful, the party would return with a few captives to be handed over to the women of the clan who had sustained the loss of a loved one. The women, in turn, would decide whether a captive was a suitable replacement for the deceased. Children and female captives were most often adopted into a clan. The clan took on the responsibility of assuming the cost of an adoption ceremony and providing for the welfare of and eventually assimilating the captive. Indeed, the constitution of the Haudenosaunee provided unambiguous directions for the adoption of captives. Quite often the adopted captive would take on all of the honors and titles of the deceased person being replaced. Gender was not especially important in the adoption ritual, and consequently young female replacements might even receive male

names or war honors that had been awarded to a dead clansman.

Adult male captives, although often adopted, were occasionally tortured, slain, and ritually cannibalized in an act of spiritual substitution or sacrifice. The victim, like those of the Mexica sacrifices, was often a complicit partner in the entire process. While being tortured by the women, armed usually with burning torches or sharp sticks, the victim defiantly sang songs and downplayed the women's attempts to cause him pain. When the victim grew weary or collapsed from blood loss or pain, the women spoke to him in kinship terms—brother, son, grandson—and gave him water and food to revive his strength. Finally, when the captive could endure no more he was killed. If he had been especially brave in his defiance of their efforts, parts of his body would be cooked and eaten so that his captors could ingest his spiritual essence.

Ultimately, the sacrifice was a victory for both captors and captive. The captive had demonstrated extreme courage and had gained a spiritual triumph. The captors had demonstrated ascendancy over a traditional enemy and had shared this triumph with those who had directly participated in the raid that resulted in the enemy's defeat. Clan grief had been diverted and even assuaged. Overall, the mourning war was a deeply religious act that counteracted the deleterious effects of grief, renewed the bonds of kinship, restored order, and maintained beneficial relations with the spirit world. In one form or another, virtually all American Indian nations practiced mourning war.

On the Great Plains, numerous tribes engaged in the practice of counting coup in battle. Often associated with a system of graded war honors, counting coup was a form of spiritual battle. It was widely understood that acts of coup in battle were ranked in order. First and foremost was touching an enemy in battle with a special coup stick, lance, bow, or even the hand. The lowest form of coup was killing the enemy. The idea of humiliating the enemy, or "capturing his spirit" and leaving him alive to suffer his defeat, was central to this type of highly ritualized spiritual warfare.

Curing the Ills of War—War Ceremonies in North America

Life within pre-Columbian America's societies was remarkably nonconfrontational and markedly pacific. By definition, a tribe is a society based on kinship. An ethos of cooperation and the give and take of well-defined relationships between all members of society are constantly reinforced through story, song, sacred history, ritual, language, and even economic practices. Violence was normally directed toward other groups, most notably traditional enemies. Having traditional foes in many ways strengthened the internal cooperative ethos of tribal groups and made war an act that was considered the very opposite of normal behavior. Most American Indians did not have a specific word for war as defined in the Western world. In the O'odham language, for example, war is the equivalent of chaos. In consequence, most Native American peoples devised specific war ceremonies intended to convey individual warriors, as well as entire societies, from normality to abnormal circumstances and behaviors and back again.

Before a war expedition was undertaken, medicine people were called upon to perform purification and protection ceremonies to ensure the safe return of warriors. Medicine people were also consulted to interpret signs and omens regarding a forthcoming conflict. Special prayers and songs were used to call upon the spirits in order to guarantee the success of a war party. Cherokee warriors were secluded for a period of time, then took part in a series of dances intended to inspire them to victory. Upon their return from a successful raid or pitched battle, Cherokee warriors handed over captives or booty to their female relatives and again went into seclusion. When properly cleansed of the taint and

trauma of battle, the warriors often donned masks and danced in a victory celebration.

Like the Cherokees, most tribes devised ceremonies that honored returning warriors and attempted to heal them both physically and emotionally of the trauma of battle. Because conflict was viewed as an extraordinary and disruptive activity, it was often treated very much like any other serious illness. The Diné (Navajo) Enemy Way, for example, is usually a four- to seven-day ceremony during which a medicine man and his helpers utilize sand paintings, songs, and particular symbols to restore the individual warrior to health. Diné medicine functions to cure the body, mind, and spirit of the individual. But Diné medicine, like that of most other tribal forms, also seeks to restore the harmony of the individual's environment. In other words, Native American medicine, especially that connected with warfare, recognizes that an individual's trauma spreads across an entire community, disrupting the balance of life. Nearly every tribal society has a particular word to describe the goal of a balanced, orderly, and harmonious existence within a particular landscape. Loosely translated, the terms mean the "peace," the "way," or the "path."

Each tribe's sacred history usually includes stories about how and why a ceremony to cure a particular illness is used. Most often, holy people, heroes, or the spirits give a ceremony to the people so that they will have the power to restore health and harmony to their particular world. The Diné Enemy Way ceremony is a recitation of the story of Monster Slayer, who slew the monsters of the world in order to provide a safe place for human beings to dwell. After he had accomplished that formidable task and had abused his special powers to do so, he fell ill. Another Holy Being recognized that Monster Slayer's illness had been brought on as a result of the death and destruction he himself had

wrought. The Holy Being devised the Enemy Way to purge Monster Slayer of the trauma of seeing so much death and to restore the beauty of the natural world. The teachings of the Diné sacred history are thus applied to certain curative processes, in this case warfare.

Although Native Americans went to war for many different reasons, they all recognized it as an extraordinary, perhaps even mysterious, event. Warriors often sought spiritual powers to aid them in combat; they also sought supernatural assistance in returning them to peace. War, among some peoples, may have been a spiritual experience or a way of serving the deities to ensure a prosperous and happy life. All Native American peoples, however, understood that because war was a terrible and terrifying experience, it absolutely required religious comprehension and sacred attention.

■ Introduction: The Many Ways to Conduct War

Since the rise of organized armies, military tactics, strategy, armaments, and organization, however varied around the world,

have shared a single all-consuming goal: to force an enemy to submit to one's will. This normally has involved violence and bloodshed. But strata-

gem and psychological ploys, essentially the ability to compel surrender without recourse to attack, have always played their roles. As noted in these pages, the Mongols, who were known for the brutality of their attacks, also employed psychological warfare and a variety of other means to undermine their opponents' morale and to effect their peaceful submission.

These common elements noted, it is no exaggeration to say that tactics, strategy, armaments, and military organization reflect the cultures of the societies that create and employ them. They have historically not been so embedded in a culture that they could not be modified and even radically changed in order to meet new challenges or to adopt some apparently superior military technique or technology. Often such borrowings were initially seen on the field of battle and then adopted and adapted to the new host's needs and culture. Sometimes the new element was improved upon, as appears to have been the case with the transit of both the trebuchet and gunpowder weaponry across Eurasia.

Sometimes the adoption was only partial. The heavy-armored mounted knights of the First Crusade, who depended on mass shock to break an enemy's ranks, were often successful in the open field, but they also had their bloody setbacks and defeats. The main opponents who provided a serious challenge to them were lightly armored Turkic horsemen who rode fast horses and used the tactic of the feigned retreat to cut off and cut to pieces a pursuing foe and whose primary weapon was not a heavy lance but rather the deadly recurved compound bow of the steppe. During the twelfth century the armies of the crusader states and military orders, such as the Knights Templar, employed their own light horsemen known as Turcoples (Sons of Turks), who fought in the Turkish manner with compound bows. Most often these troops were Eastern Christians, but some were Muslims. Used mainly as a screening force, the Turcoples rarely if ever constituted the heart of any Latin army on the battlefield. The status of the heavy-armored knight in Europe was such that the crusader leaders and their vassals continued to arm themselves as knights and to fight in the same manner as their predecessors of the First Crusade. To put aside their ever-evolving

and increasingly heavy armor and the weapons suitable for shock troops was unimaginable.

As you read the entries and sidebars under this topic and elsewhere within this theme, ask yourself these questions: What attributes of the armies described here seem to have been culturally specific, even unique? Which elements seem to have been common to a wide variety of armies, and which elements were simply responses to the exigencies of time and place?

—Alfred J. Andrea

The Armies of the Islamic Middle East

In the history of the world, very few polities can claim to match the stunning conquests made by Islam's earliest rulers. By 750, a little over a century after the death of Muhammad in 632, Arab armies conquered lands stretching from the Iberian Peninsula in the West across North Africa and the Near East and into the Tang Chinese empire (618–907) in the Far East. However, by the year 1000 internal strife and changes in the internal demography and society of the Islamic world totally altered the nature and composition of the Islamic armies. In the early periods of Islamic history, the armies were drawn largely from tribal levies and lived in garrison towns (*amsar*, sing. *misr*). By the turn of the millennium, these Arab military units were long since demobilized, and the descendants of these original forces were now largely indistinguishable from the native populations.

In their place, the Abbasid caliphs of the mid-ninth century began the practice of importing polytheistic Turkic peoples to serve as cadres of loyal slave-soldiers (*mamluk*, pl. *mamalik*). These slaves were usually manumitted (freed) after completing their training and upon their conversion to Islam. Because of their presumed loyalty and the elite units in which they served, some rose so high as to assume the caliphate's most powerful political and military posts. This model, in varying forms, would prove to be the dominant military hallmark of Islamic polities until the nineteenth century.

The procurement of slaves was done largely through the practice of *ghaza* (raiding). As the *thughur* (borderlands) between Islamic and non-

➤ MAMLUKS AND JANISSARIES

While there seems to be much in common between the mamluk (derived from the Arabic for “taken in possession”) and the janissary (anglicized from the Turkish *jeniçeri*, meaning “new soldier”), there is much that differentiates these soldiers. Both groups were originally servile in origin; both were trained in political, military, and Islamic religious theory; and both derived their identity and their standing in society from their association with their corps. However, it is here that the resemblances end.

Mamluks were purchased from among non-Muslim populations, primarily from western Central Asia in the beginning and later from Circassia and the Caucasus. They were brought into the Islamic world largely to replace the demilitarizing Arab tribal levies after the Umayyad period (661–750). The mamluks were also able to rule Egypt and Syria in their own right as the Mamluk dynasty. Most importantly, though, they were freed after their training and conversion to Islam but remained bound in loyalty to the caliph or sultan whom they served.

Janissaries, on the other hand, were drawn from Christian families of newly conquered territories in the form of a tax (known in Turkish as the *devşirme*, literally meaning “blood tax”). They were brought in to form a paid corps of loyal bodyguards to the Ottoman sultan. While they were able to influence the succession to the sultanate in certain instances, they were never able to rule in their own right. Finally, they remained the property of the sultan throughout, technically never becoming free even though they received wages. Recognizing their own importance, the Janissaries revolted for a higher salary in 1449. The repeated capitulations of generations of sultans would

Mounted Janissaries of the Ottoman Turkish army, from an early-eighteenth-century manuscript. (The Art Archive/Topkapi Museum Istanbul/Dagli Orti)

create a corps rife with corruption, leading to their eventual liquidation by Sultan Mahmud II (r. 1785–1839) in 1826.

—Rasheed Hosein

Islamic lands was often an unlawful and unruly place, enterprising raiders (*gbazi*) would raid and skirmish with their non-Muslim counterparts. In the case of Byzantium, these were special border troops known as *akritai*, many of whom were Armenians. It is important to note that these incursions were not official raids. Rather, they appear to have been done more for commercial gains than religious reasons. Notwithstanding, the East Roman (Byzantine) empire

and the Islamic caliphate rarely punished these raiders, and in the popular mind *gbazis* were often revered as holy warriors (*mujahidin*).

Due to the revenues generated by raiding and the need for slaves, extensive infrastructure was required to streamline the shipment of goods and people back into Islamic lands. This led to increased commercial and social contact in the *thughur* and to the increased permeability of the borders that separated Dar al-Islam (the Abode

of Islam) from non-Muslim territories (Dar al-Harb, or the Abode of War), thereby allowing Islam to spread into regions not formally under Islamic control. This trend can best be seen with the movement of the Oghuz Seljuk Turks in the tenth century. Their coming marks the first mass migration of an entire nomadic tribe, already Islamized, into the caliphate. This Turkic group would establish the Seljuk dynasty (1038–1194) and rule in the name of the Sunni caliph, expanding the borders of Islam into the Anatolian Peninsula.

While the Seljuk Turks at their height would stabilize and rule much of the core lands of the Islamic caliphate (i.e., present-day Iran, the northern third of modern Iraq, parts of the Anatolian Peninsula, the Levantine lands of present-day Syria, and Lebanon, Jordan, Israel, and the Palestinian state), they would also practice the time-honored but essentially destabilizing central Asian custom of appanage corporate sovereignty. This practice held that any Seljuk prince had the right to rule. Thus, rulers would carve their patrimonies into portions for each son to rule. The theory held that the strongest son would reconstitute the original patrimony and rule as the survivor. However, in practice this created a series of fractionalized principalities that were continually at war with each other. Increasingly, these principalities came to be governed by minors. In these cases, the strongest Seljuk rulers placed an individual known as the *atabeg* (father-ruler), who theoretically acted as a military and political tutor for the young ruler but often dispatched the child-ruler and governed outright. The net result was the division of the Seljuk army, an almost constant state of internal strife between principalities, and in some cases civil war between forces loyal to the *atabeg* and those loyal to the Seljuk prince within a single principality. It is into this situation that the crusaders appeared.

Beginning in 1096, the First Crusade established a Latin Christian bridgehead in the Levant with the establishment of the four crusader states, especially the kingdom of Jerusalem. The shock of the initial crusader victories and subsequent Frankish colonization united the previously factionalized Muslim rulers. In response, the Seljuks reverted to the use of the *iqta* (assignment of

land revenue) in order to address the new crusader threat. The *iqta* was not a Seljuk invention, but the Seljuks used this institution to help revitalize the military. In exchange for the rights over revenue of a territory, an *amir* (in this context meaning a military commander) would pledge military service. It is important to note that this form of *iqta* bears only a superficial resemblance to the feudal fief of Western Europe. It only involved assignment of revenue generated by the territory; it did not include the right to govern the land. Most importantly, there were term limits to the revenue assignment, and the fiduciary rights could be revoked at any moment by the Seljuk ruler.

Both the appanage system and the military *iqta* would be used to combat the crusaders, lasting into the Ayyubid period (1171–1250) when the Kurdish dynasty founded by Salah al-Din Ayyub, or Saladin, ruled Egypt and Syria. However, the systemic faults of corporate sovereignty were not removed by the presence of the Franks; they were merely interrupted. As regional Ayyubid rulers and *atabegs* vied for power, they began to build armies using the time-tested slave-soldier model. This led to internal strife and dissent until 1250, when a cabal of mamluk cavalrymen seized outright control of Egypt. Over the next decade, the Mamluk dynasty (1250–1517) set out to unify Egypt and the Syrian littoral until the second great external threat arrived. In the mid-thirteenth century, Mongol forces smashed into the Islamic world, sacked Baghdad in 1258, and effectively ended the Abbasid caliphate. It would only be the powerful Mamluk cavalry that proved able to stop the Mongol conquests, defeating them at Ayn Jalut (1260) and preserving the Arab nature of Egypt. Under this dynasty, Egypt experienced prosperity and power not seen since the time of the pharaohs. However, in 1517 the Mamluks of Egypt were swept aside by the Turkish Ottoman dynasty (1300–1924), which also used slave-soldiers in its fearsome Janissary corps.

The Armies of Byzantium

The Byzantine military system evolved from the defense against the Arab invasions that allowed the empire to survive during the seventh and eighth centuries. As they were ravaged by yearly raids and invasions, Byzantines defended themselves in walled settlements and fortresses guarding the major passes, and since they lacked the manpower to defeat the invaders in open battle, they developed a strategy of defensive warfare that relied on local forces, ambushes, and well-developed intelligence. The empire was divided into military zones known as *themes*, each with a roster of local soldiers required to show up for

campaigns annually with horse and equipment. Through the middle Byzantine period, most thematic soldiers (*thematikoi*) were supported by grants of land, but landholders often paid for a soldier rather than fighting themselves. Byzantium also had full-time professional forces (*tagmata*) who served as imperial guards and specialized forces. In the tenth century, as Byzantine rulers were able to lead offensive campaigns against Bulgars and Arabs, the use of *tagmata*, including heavy armed cavalry and mounted archers, increased, and mercenary soldiers were hired from within and outside the empire. Eleventh- and twelfth-century Byzantine forces were made up of all three elements and were increasingly multiethnic, drawing on the populations of reconquered and resettled peoples such as Cumans and Pechenegs as well as foreign mercenaries ranging from Varangians from the north to Norman and Frankish knights and Turkish archers. Provision of foreign soldiers was frequently included in twelfth-century treaties. Unlike many Western European rulers, Byzantine emperors had no ideological proscriptions that prevented their hiring non-Christian forces (but the Norman and Hohenstaufen rulers of Sicily and various lords of the crusader states in the East also employed Muslim mercenaries).

Several features distinguished Byzantine warfare from that of their neighbors. The science of warfare was the subject of treatises on strategy and tactics that gave advice on diversionary tactics, battle formations, enemy characteristics, and leadership. Regular exercises and training were conducted. The empire also provided sophisticated logistical planning for supplies of food, weapons, and horses for campaigns. Through 1204 Byzantine armies were imperial armies, paid and commanded by emperors and their generals; this was part of a planned imperial strategy. This disciplined approach to war made it possible for armies to win against less-organized forces even when they were greatly outnumbered and was the decisive factor in Byzantine military success.

As the twelfth-century Byzantine empire faced new military challenges on all borders and new styles of warfare, its military resources were no longer adequate, and emperors increasingly relied on foreign troops. The situation was

► THE VARANGIAN GUARD

Byzantine emperors were guarded by legendary troops known as the Varangian Guard. The term “Varangian” originally described the Vikings and Rus (Russians) who raided and traded in Byzantium, but the guard was created by Basil II when Prince Vladimir of Russia sent 6,000 Varangian warriors to Byzantium as part of a treaty in 988. The Varangians became the imperial guard, known for their long axes and vow of loyalty to the emperor, a prized characteristic in an age of intrigue. They served as the personal bodyguard of the emperors at court and had prominent ceremonial roles, but they were also frontline warriors in battle and provided critical defense of the emperor against internal rebellions. Varangians were recruited from throughout the northern world, and their exploits are celebrated in Norse sagas. Many Anglo-Saxons joined the guard after the Norman conquest. The Varangian guard’s last military role was in the defense of Constantinople against the Latin crusaders in 1203–1204, where they fought valiantly against their coreligionists.

—Dorothy de F. Abrahamse

exacerbated after the Latin Conquest of 1204, when the restored empire lacked financial resources to support soldiers. Thematic soldiers disappeared, and larger landholders were increasingly given the rights to rents and peasant obligations on state property (*pronoia*) in return for service. Treaties and payments were used to procure mercenaries, but limited resources meant that the Byzantine military was very small. Foreign soldiers could prove a greater problem than benefit; the Grand Catalan company, hired to fight the Turks in Anatolia, went on to ravage Greece and rule its own state in Athens in the fourteenth century. In a violent age, late Byzantine armies were no different than those of many other small states, and the soldiers who fought were often identical to their opponents. By the fifteenth century, the resources, discipline, and strategy that had once given Byzantium its superiority now belonged to the Ottoman Turks.

The Armies of India—Muslim and Hindu Asia

The period between 1000 and 1500 CE witnessed the establishment of Islam and Muslim kingdoms in northern and central India, accompanied by ongoing wars among Hindu and Muslim rulers. Politically, the many small clan-based Indian states were gradually replaced by more centralized larger states based upon military effectiveness. Initially, invading Muslim armies shared many technical characteristics with their

Hindu opponents but introduced more effective tactics, logistics, and discipline, and ultimately they prevailed because of superior firepower due to their growing use of firearms. Gunpowder weapons were introduced into India as early as the thirteenth century, possibly through Mongol invaders, and certainly they were to be found in India in the fourteenth century. With such weapons, there was a tendency of larger and wealthier states to absorb the smaller ones. Because the technology was expensive, however, only the richest rulers could afford firearms. As artillery became more powerful, these rulers were more able to capture the fortresses of their neighbors.

By 1000, northern India was divided among many small states ruled by an aristocracy known as Rajputs. The Rajputs were divided into clans, with the different clans often at war with one another. At times Rajput rulers put their differences aside to form alliances when facing outside threats, but the lack of centralized control weakened their armies.

Hindu armies of the time consisted mainly of three arms: cavalry, infantry, and elephants. Cavalry was the most prestigious and was reserved for the nobility. Most war horses were obtained from Central Asia, and the expense of obtaining and maintaining a horse was beyond the means of most Indians. Riders wore chain mail armor and were armed with Central Asian recurved composite bows as well as swords. Infantry was largely composed of poorly trained peasant farmer levies that helped provide a base around which the cavalry could maneuver. Elephants, usually covered in armor, had archers mounted on their backs and were used to break up opposing formations. As with artillery later, only the leading states had more than a few elephants due to their cost and the expense of their maintenance.

Around 1000 a Muslim Turk out of Afghanistan, Mahmud of Ghazni (r. 971-1030), began raiding into India, apparently driven by a desire to spread Islam and to obtain loot. On November 28, 1001, Mahmud defeated the local Hindu ruler at Peshawar. Following this victory, Muslim raiders continued to harass neighboring Hindu states.

Like similar Muslim armies, especially out of Central Asia, Mahmud's forces were mostly

VOYAGE BEYOND THREE SEAS

Afanasii Nikitin, who sojourned in India between 1471 and 1474, is the only known eyewitness to have recorded a battle between the two greatest powers on the Indian subcontinent in the fifteenth century: the Muslim Bahmanid kingdom and the Hindu kingdom of Vijayanagar.

“The sultan [Muhammad III, r. 1463–1482] set out of Bidar. . . . He had twenty-six viziers—twenty Muslim and six Indian viziers. From the sultan’s court there came out 100,000 warriors on horseback, 200,000 foot soldiers, 300 elephants in armor with towers on them and 100 ferocious beasts, each held by a double chain. . . . And every vizier had ten or fifteen thousand warriors and twenty thousand on foot. . . .

The prince of Vijayanagar had an army of 40,000 mounted warriors with him, and also 100,000 foot soldiers, and forty elephants in armor with four warriors with guns on each of them. . . . And the Great Indian Prince is very powerful. . . . His fortress stands on a mountain; and his capital city Vijayanagar is very large. It is surrounded by three moats, and a river flows through it; one side of the city is a wild jungle, and on the other side there is a very beautiful valley, good for anything. The opposite side is impassable—the way lies through the town; it is impossible to capture the town from any side; the mountain is large and the thicket is severe and thorny. The [sultan’s] army stood near the town for a month, and people died of hunger and thirst; they could see the water but could not reach it.

Khodja Melik-at-Tujjar [the sultan’s general] captured the Indian town [Gulbarga]—took it by force; twenty days and nights the troops fought and did not eat or drink; besieging the town with cannons. And 5,000 of his best warriors were killed. When they seized the town they killed 20,000 men and women, and 20,000 more were taken captive—adults and children. They were sold into slavery for ten or five coins, the children for two coins. But they didn’t take the treasury. And he did not capture the capital city.”

—Mary Jane Maxwell

Source

Translated by Mary Jane Maxwell from Ia. S. Lur’e and L. S. Semenov, *Khozhdenie za tri moria Afanasia Nikitina* (Leningrad: Nauka, 1986), 54–56.

cavalry. The main striking force was a core of chain mail-armored cavalry who were experts with powerful composite bows. Using long lances and swords, they also rode down their disordered opponents. Less well-armored cavalry provided additional archers. Mahmud and other Muslim invaders also used religious volunteers known as *ghazis* (holy raiders) as infantry and additional cavalry. Unlike the highly disciplined regular cavalry, the ghazis were an unruly group.

Technologically, the Muslim and Hindu armies were evenly matched. The Muslims prevailed, however, because of their superior tactics and generalship. Elephants, for example, were defeated by the use of flaming projectiles and arrows shot against their unarmored legs.

By 1191, the Ghori dynasty ruled Afghanistan and northwestern India. That year Mahmud of Ghori led an army toward Delhi, capital of the Rajput ruler Prithviraj. Prithviraj managed to form a coalition of Rajput rulers and defeated Mahmud at Tarain. The Hindu army was quite a bit larger and managed to overwhelm the Muslims by force of numbers. Mahmud was badly wounded and barely escaped. Prithviraj, however, failed to pursue and lost his chance to destroy his Muslim enemy. The following year, the two leaders again fought at Tarain. Although outnumbered, Mahmud used his horse archers to wear down the Indians. Prithviraj’s allies were reluctant to take orders from him, making the Hindu army a ponderous, disordered mass. Toward the end of the day Mahmud unleashed his reserves, shattering the Hindus. Prithviraj was captured and put to death. Mahmud subsequently established the Delhi sultanate, controlling most of northern India. Many Hindu warriors were incorporated into his army, including those hired as mercenaries.

The Delhi sultanate continued to expand against its smaller neighbors, but it suffered invasions from Mongols out of Central Asia almost as soon as it was created. In 1221 two Mongol tumens (about 20,000 men) raided through northwestern India. In 1235 Mongol forces invaded Kashmir, turning it into a dependency. The highly disciplined Mongol cavalry army was able to easily outmaneuver the Indian forces sent to stop them. The raid, happily for the sultanate, was just that: a hit and run raid.

The sultanate used the time between Mongol raids to strengthen border fortresses and to create more mobile units that were intended to defeat Mongol raiders before they reached important cities. Although Mongol invasions and raids took place in 1304 and 1328, they were defeated by the sultanate's armies. Mongol inroads into northwestern India then ceased until 1398, when Timur-i Leng's Turkic-Mongol army out of western Central Asia (present-day Uzbekistan) captured and plundered Delhi. Although the sultanate continued on, its power was broken.

The Delhi sultanate survived for over 300 years. Despite its increasing technological lead over other Indian states, its rulers adopted many of the feudal characteristics of the Indian rulers they displaced. As a result, the Muslim sultan was defeated at the First Battle of Panipat on April 21, 1526, by the invading Mughal army out of Afghanistan, ironically the ancient homeland of the Delhi sultans. The Mughals under Babur successfully combined horse archers and gunpowder weapons to defeat a much larger Delhi army.

The conquest of northern India by Muslims threatened the remaining Hindu kingdoms in the south. Two brothers, Harihara and Bukka Raya, managed to unite these kingdoms in 1336 by using their shared Hindu culture, establishing the Vijayanagara empire. The Vijayanagara army consisted of a central force estimated at around 100,000 infantry, 20,000 cavalry, and 900 elephants. This force was supplemented by feudal levies that could have resulted in one million soldiers. The army recruited members of all classes and depended mostly on infantry consisting primarily of archers and swordsmen. The Vijayanagarans were especially noted for their widespread adoption of gunpowder weapons, especially the *ban*, a steel tube filled with gunpowder attached to a length of bamboo.

The Armies of China

Chinese armies in the period between 1000 and 1500 experienced great change, as societal priorities and foreign invaders reshaped China's military institutions. Social and economic conditions in eleventh-century Song China (960–1279) were quite different from those that existed under the Tang dynasty (618–907). During the Northern Song period (960–1126), the opening up of the south stimulated economic growth and increased wealth and social mobility. A return to Confucian values raised the status of the *shi*, or local scholar gentry, who emphasized civil rather than military institutions. Consequently, the Chinese army found itself under the firm control of civilian authorities, and the position that military men held in society was downgraded from that in Tang times.

Rank-and-file soldiers during the Northern Song period were often mercenaries, serving for pay and rations and recruited from the lowest echelons of society (criminals, vagrants, and amnestied bandits). Introduced in the 960s, this *yang-ping* system was not only intended to provide soldiers for the Song dynasty but also served as a social welfare program employing the destitute, thereby further eroding the reputation of the military. The result of the *yang-ping* system was poorly trained and poorly motivated soldiers, often exploited by the officer class and by the government itself. By the 1040s, this mercenary army was only receiving one-tenth of its promised wages, precipitating an environment in which mutinies, desertion, and military banditry became a constant threat to domestic tranquility. In 1043, the Winged Tiger army sent to restore order in Shandong Province defected en masse to the rebel Khitans (Qidans). Not only was the *yang-ping* system inefficient, but it also proved very expensive, as the Chinese military rolls tripled in size from 378,000 soldiers in 960 to more than 1.2 million in 1141,

► THE RISE OF CHINESE INCENDIARY AND GUNPOWDER WEAPONS

China was a civilization of walled cities rather than castles, and the size and strength of a city's walls often determined its status in the hierarchy of rule. Although there are many examples of successful assaults on strong urban fortifications, the Chinese art of war preferred the taking of a city by treachery or surprise rather than by storm. And if this did not work, blockade was seen as more effective than assault. But if an assault was undertaken, China's armies from the Song dynasty onward developed or employed technologically advanced weapon systems, including counterweighted sling-propelled trebuchets of all sizes that could launch stone projectiles and naphtha-filled canisters, fierce fire oil that was probably similar to Greek fire in the West, and hand-held fire lances (short-range flamethrowers). The Chinese had developed early forms of the sling trebuchet by at least 121 CE, with stones propelled from these devices by human teams pulling on ropes. As the trebuchet moved westward, huge counterweights, normally baskets of rocks, replaced the pulling teams, giving the artillery piece greater range and force. Probably during the twelfth century, this improved far-reaching machine reached China from the Islamic world.

Perhaps most significantly, gunpowder was developed and perfected as a weapon in the

period 1000–1500. Initially discovered around 850 CE and used for its incendiary properties, gunpowder's true potential was finally understood when the proportion of saltpeter was raised to around 75 percent, creating a devastating blast. Under the military-minded Mongol Yuan dynasty, more efficient projectile weapons were created and employed, including rockets, bombs, and handguns. Ming China continued to develop gunpowder technologies. Under the Yongle emperor, a special headquarters was established in Beijing to train gunners, and under the direction of the military reformer and general Qi Jiguang (1528–1588), hand gunners were integrated at the squad level next to bowmen, swordsmen, and spearmen. Unlike the Europeans and the Muslim gunpowder empires of the period, the Chinese did not attempt to fully exploit the potential of handguns through the standardization of manufacturing techniques and calibers or the creation of new tactics and tactical formations. Consequently, the Chinese lead in gunpowder technology evaporated in the early modern era, leading to a clear European superiority in weapons and the forced opening of China in the 1800s.

—Brian Todd Carey

eventually consuming 80 percent of the governmental budget.

Song military reforms took place under the Shenzong emperor (r. 1067–1085) with the introduction of the *baojia* system. In order to reduce the cost of a large standing professional army, local villages were given the responsibility of organizing militias to provide local security and provide reserves in times of war. Each unit of ten households was required to provide one man to undergo training. The Shenzong emperor also provided war horses to local villagers in suitable areas and gave peasants permission to use the horses for agricultural purposes as long as they were maintained in good condition and the government was compensated if the horse died. He also set up a Directorate of Weapons to improve the quality of Chinese armaments.

Chinese infantry in this period was organized around squads of five men who would fight five files deep. Late Song era manuals and archaeological evidence point to the best-equipped heavy infantry in Chinese history up to that time. Soldiers were armed with swords, spears, various types of polearms, and most notably the crossbow (*nu*). Crossbows were manufactured in state armories, and improved designs were continuously developed. Crossbowmen were employed in separate units and were often protected by archers. Early Song generals had access to mercenary cavalry composed of non-Chinese steppe nomads, who were adept in horse archery, but Chinese commanders during the Southern Song era (1127–1279) were forced to use native Chinese cavalry, and the quality of these cavalry units was inferior due to their restricted access

to both the horses and horsemen of the northern steppes. The largest maneuver unit of a Chinese army of the Southern Song period consisted of 3,200 soldiers, with cavalry and infantry coordinated on the battlefield through the use of flags, banners, bells, and drums.

Still, despite the employment of state-of-the-art trebuchets, flamethrowers, and other incendiary devices, the Song rulers lost northern China to the Jurchen (Ruzhen) Jin dynasty in 1126, ushering in the Southern Song period. Decades later, the Mongols replaced the Jin, and by 1279 the Mongols had captured all of China, which they ruled under the Yuan dynasty (1260–1368).

Yuan armies were made up of four components: a large Mongol cavalry arm directly under the emperor's control, the armies of Mongol clans allied with the emperor but who fought under their own commanders, a composite army made up of subject or tributary peoples (Khitans, Jurchens, Koreans, and Tibetans), and captured Song forces conscripted into infantry and artillery units, traditionally the least reliable and most expendable troops. The Mongols organized their armies according to a decimal system into *tumans* of 10,000 men and *minghans* of 1,000 men, though in practice Yuan tumans varied in size between 3,000 and 7,000 men. True to their Mongol roots, Yuan generals emphasized mobility, surprise, and deception on the battlefield and used their light cavalry archers to attack the flanks and rear of enemy formations or to goad enemy cavalry into following a feigned retreat and into a preplanned ambush.

Yuan emperors used the Chinese infrastructure (roads, canals, and bridges) inherited from the Song to project force throughout the empire and launched campaigns into difficult terrain (the mountains of Sichuan, the Gobi desert, and Burmese jungles) to expand Mongol suzerainty, while Yuan commanders understood the tactical specialization of their troops and used them accordingly. Native Chinese infantry accompanied Mongol cavalry into mountainous areas, and northern Chinese and Korean soldiers and sailors were deployed along major rivers, in coastal areas, and on naval expeditions (against Japan in 1274 and 1281 and Java in 1293). Song Chinese and captured Muslim engineers employed siege artillery, while the former also introduced new

gunpowder weapons to the Yuan arsenal, most notably antipersonnel mines, handguns, and wheeled rocket launchers capable of firing hundreds of projectiles at a time. Archaeological evidence points to a continuity in infantry tactics, arms, and armor from the Song to the Yuan period, though Mongol variations of cavalry equipment (composite bow and lamellar armor) did appear. Yuan military structures would be adopted by early Ming commanders in the fourteenth century with an emphasis on new gunpowder technologies, especially cannons cast in both bronze and iron despite low rates of fire and prevalent malfunctions. Gunpowder weapon development stagnated in the fifteenth century, and superior European-designed handguns and cannons quickly replaced Chinese weapons in the sixteenth century.

Succession problems (seven Mongol emperors in the 40 years after Khubilai's death) followed by natural disaster and rebellion weakened the Mongol hold on China, and in 1368 native Chinese rule was restored under Zhu Yuanzhang (r. 1368–1398), founder of the Ming dynasty (1368–1644). Taizu, as he is also known, was a vigorous campaigner, winning control of all of China and extending Chinese hegemony west to Central Asia, north to Inner Mongolia, and northeast into Manchuria and Korea. Under Emperor Chengzu, or the Yongle emperor as he is more often known (r. 1402–1424), the Chinese continued their offensive against Mongol power in Inner Asia while bringing Annam (North Vietnam) in Southeast Asia into the empire. The Yongle emperor is perhaps most famous for sponsoring the great Ming maritime expeditions that briefly established China as the premier naval power in East Asia and in the Indian Ocean.

Early Ming—Grand Strategy along the Steppe Frontier

For well over 2,000 years, the Chinese were preoccupied with policing their northern border lands against powerful nomadic peoples. Steppe societies either menaced imperial China from a distance (e.g., the Xiongnu, Turks, and Uighurs) or conquered significant portions or the entirety

of China during this long period (e.g., the Jurchen [Ruzhen] Jin dynasty, the Mongol Yuan dynasty, and the Manchu Qing dynasty). Although vastly outnumbered by their Chinese opponents, steppe warriors possessed superior cavalry skills and used maneuver warfare and hit-and-run tactics to secure victory over their infantry-heavy Chinese foes. But relations with the steppe peoples were not always adversarial. The rise of the so-called Silk Road benefited both China, which produced the luxury items, and the Central Asian peoples who often controlled the land routes

► THE GREAT WALL OF CHINA—MYTH AND REALITY

Few examples of monumental architecture are more closely associated with their civilizations as the Great Wall is to ancient China. Conventional wisdom maintains that the first parts of this fortification were erected during the Qin dynasty in the third century BCE as a bulwark against barbarian incursions. Over the millennia, the Great Wall was then either added to or fell into a dilapidated state, depending on the relationship between the ethnic Chinese and their northern nomadic neighbors. Recent scholarship, however, has shed light on the dating of the Great Wall of China, and it is now accepted that the structure we associate with this linear defense was mainly erected during the early Ming dynasty, in the late fifteenth and sixteenth centuries, though it is likely that previous fortifications were incorporated into this comprehensive barrier.

Other myths and uncertainties persist concerning the Great Wall. Although an iconic structure, there is not an agreed estimate of its length. To the Chinese, it is “The Ten-Thousand Li Great Wall,” a *li* being about one-third of a mile or about half a kilometer. But “10,000 *li*” is a traditional Chinese phrase meaning “very long.” Conservative estimates place it at 1,500 miles (2,400 kilometers) in length, while a more liberal accounting places it at nearly 4,000 miles (6,500 kilometers) in length. The accuracy of any number is made problematical because, contrary to popular belief, the wall is not a single continuous fortification but rather a series of walls and towers with large gaps and also parallel lines in some places. Moreover, the Chinese often used natural topography when possible to augment the wall. Another myth without any

The Great Wall before the Ming Great Wall. Constructed as early as the Warring States Period (about 475–221 BCE), this segment of earthen wall and beacon towers stretched for over 600 miles across a portion of North China, and was rebuilt and maintained down to the thirteenth century CE. It was one of many such berms along China's northern and western frontiers. (Alfred J. Andrea)

basis in reality is that the Great Wall can be seen from the moon. Likewise, there is no evidence that dead bodies fill the interior of the Ming era structure. Indeed, their decomposition would have weakened the walls and towers, and the engineers knew that. Still, the Great Wall is a marvel of military engineering, towering to over 25 feet (7.6 meters) in height, spanning some 30 feet (9 meters) in width, and tapering from the base to the top. The Great Wall served the Ming dynasty well as a force multiplier, as a tollgate for nomadic and Chinese goods, and as a symbol of ethnic Chinese power.

—Brian Todd Carey

from East Asia to the very lucrative markets in western Eurasia. A symbiotic relationship existed between these two societies, but differences in culture bred distrust and invariably war. In order to maintain a balance of power, the Chinese developed (and sometimes abandoned) various grand strategies to deal with the persisting nomadic threat.

Historians and anthropologists have generated various theories to explain Sino-nomadic relations. The “trade-or-raid” thesis posits that pastoral societies required three commodities that they could not produce for themselves: grains, textiles, and metals. As long as the Chinese granted access to these resources through marriage alliances, tribute missions, and border market towns, peace was maintained. If the Chinese closed down these mechanisms, tensions rose and nomadic armies invaded. Another explanation places more emphasis on the role of luxury goods in cementing relationships between local nomadic chieftains and their regional rulers. When the Chinese disrupted this flow of goods, it created unrest within barbarian communities, and the ties that bound these societies together unraveled, causing instability and eventually war.

During the Song dynasty (960–1279) the Chinese were on the defensive, maintaining strong tribute relations first with the Khitans (Qidans) and then with the Jurchen. This policy enriched both the Chinese and the nomadic dynasties, but the rise of the Mongols and their eventual displacement of the Jurchen in 1234 placed the ethnic Chinese in a precarious position. Their economy faltering, the Song finally succumbed to the Mongol military machine in 1279, ushering in a 90-year Mongol occupation of China under the Yuan dynasty (1279–1368). When native Chinese rule was reestablished in 1368 under the Ming dynasty, its first emperor, Taizu (r. 1368–1398), led military campaigns deep into Mongolia to keep the Mongols off balance and established a line of eight garrisons within the steppe lands, while his successor Chengzu, known more often as the Yongle emperor (r. 1402–1424), abandoned seven of his father’s steppe garrisons but ordered the construction of watch and signal towers and “long walls” (*changcheng*) at certain strategic places along the steppe frontier, especially in mountain passes. This was

not, however, a prototype of the so-called Great Wall that one sees today; its construction lay in the future. To augment its offensive military campaigns and linear defenses, Ming grand strategy also included hiring Mongol and Jurchen military groups to fight with the Chinese against their nomadic brethren.

By the late fifteenth century, however, these means proved insufficient, as China experienced increasing pressure from its nomadic neighbors to the northwest, especially the Oirats, or Western Mongols. Consequently, the Ming Court accepted the recommendation of the border official Yu Zijun, who advocated the construction of a static line of defense—an earthen wall—along the border of the Ordos Plateau. This first wall, some 566 miles (910 kilometers) in length, was completed in a few months in 1474 by about 40,000 conscripted men. It and a nearby wall, which was 129 miles (207 kilometers) in length and constructed at the same time, initiated the Ming Great Wall project that continued and grew throughout the next century, metamorphosing into stone and brick walls and watch towers from 1572 onward.

East Asian Navies, 1000–1600 CE

In the period 1000–1600 the navies of China, Japan, and Korea became the most sophisticated in the world, building large oar- and sail-propelled vessels capable of transoceanic voyages and well supplied with modern armaments.

➤ THE “DIVINE WIND” (*KAMIKAZE*) AND THE RISE OF THE SHOGUNATE

In 1266, 13 years before he fully subdued Song China, Khubilai Khan sent a messenger to Japan demanding submission. The Japanese refused. In preparation for the invasion to come, the Mongol ruler assembled a navy of 900 ships to transport some 90,000 Mongol, Chinese, and Korean troops. The fleet crossed the Strait of Korea in 1274 and landed near Hakata on the northern shore of the island of Kyushu. Here, the assembled samurai met the Mongol invaders with fierce resistance, and after two days of fighting the invasion force withdrew. Heavy casualties did not deter Khubilai Khan from trying again. He renewed his demands, but his envoys were beheaded by the Kamakura shogun. Determined to crush the Japanese, Khubilai Khan dispatched a massive invasion force in 1281 consisting of 140,000 Mongol, Korean, and Chinese men. The landing area was once again Hakata, but the Japanese had spent the intervening years preparing the area, building a large defensive wall along the bay and, more importantly, training the samurai to fight as a group, a much different style than the individual combat customary in Japanese warfare to that time. For seven weeks the armies fought until a great storm, called the *kamikaze* (“divine wind”) by the Japanese, swept through northern Kyushu and wrecked the Mongol fleet. The Mongol invasions represent a watershed in Japanese history. The Kamakura shogunate (1192–1333) marshaled the resources of Japan to meet this threat, but after this threat dissipated, the shogun’s control over the countryside did not. The *bakufu* (literally “tent government,” thus “field commander’s government”) and not the imperial court was now the true power in Japan.

—Brian Todd Carey

Although the Chinese had made use of waterborne operations to cross their many large rivers since ancient times, the first independent navy was not created until the Han dynasty (202 BCE–220 CE) with the creation of the Tower Ship Navy. So-named after the large carvel-built ships sporting layers of superstructure ideal for supporting missile troops and marines, these massive ships were also equipped with rudders,

anchors, oars, and sails and were supported by smaller warships and troopships. These Tower Ships continued to be featured in Chinese naval warfare until the thirteenth century. By this time, Tang- and Song-era improvements in ship design and navigation (e.g., the addition of cross-ribbing to strengthen the ship’s beam and the invention of the compass) as well as new ship designs (human-powered, paddle-wheeled warships) greatly increased the versatility of the Chinese Navy. The largest of these paddle-wheeled warships was driven by 36 wheels and could transport 1,000 troops.

Song naval superiority helped keep the Jurchen (Ruzhen) at bay, a lesson that the later Mongols under Khubilai Kahn would learn. In 1270, Khubilai ordered the construction of 5,000 warships and the training of 70,000 warriors in naval combat. Several thousand Mongol warships went into action against the Song Navy in 1273, and the Song were finally defeated in a climactic sea battle off the island of Yaishan in 1279. The Mongols also used their own navy, and those of the Chinese and Koreans, to launch expeditions against Japan (1274 and 1281) and Vietnam (1282 and 1287). These campaigns represented the apex of Mongol naval ambition.

Chinese naval power during the native Ming dynasty (1368–1644) was unrivaled anywhere in the world. Initiated by the Yongle emperor (r. 1402–1424), the Chinese used a form of “gun-boat diplomacy,” sending out seven expeditions between 1405 and 1433 to reestablish Chinese influence after the Mongol interregnum, impose imperial control over the sea-lanes, and impress the peoples of the Indian Ocean littoral. Commanded by the Muslim eunuch Admiral Zheng He, these flotillas contained perhaps 300 ships, including scores of massive six-masted “Treasure Ships,” and were crewed by perhaps 28,000 sailors. These voyages were eventually seen as too expensive and were discontinued. Ming regional naval supremacy waned and was faced with a new maritime threat in the sixteenth century, Japan.

The naval histories of Japan and Korea are intertwined. The Korean Peninsula lies only 30 miles (48 kilometers) from the Japanese island of Tsushima and 150 miles (240 kilometers) from the main Japanese islands, making the sea-lanes

across the Strait of Korea a classic invasion route in both directions. Archaeological evidence points to a Korean origin for the Japanese aristocracy, while Japanese navies assisted the Korean kingdom of Paekche against its rivals Silla and Koguryo in the seventh century CE. It is, however, only in the twelfth century that a clear picture of Japanese naval tactics emerges. During the Gempei Wars, rival samurai armies lashed ships together and laid down planks to create a surface on which to fight. In the thirteenth century, Khubilai Khan used Korea as a base of operations for two unsuccessful attacks against Japan, requiring the Koreans to build 900 ships for the expeditions.

Even before the failed Mongol invasions, a major naval activity in the Strait of Korea consisted of Japanese pirates menacing the coastlines of both countries. Known as *wako*, these Japanese marauders greatly increased their activity in the fourteenth century, tallying 174 recorded raids on Korea between 1376 and 1385. Japanese raiding expanded to China, but a threat by the first Ming emperor to invade Japan forced the Japanese government to rein in the pirates. Korea also fought back. In 1380 over 500 Japanese pirate ships were set on fire at the mouth of the Kum River, and in 1389 and again in 1419 Korean ships attacked the pirate bases on Tsushima. At the end of the fifteenth century, official commercial relations between Japan and Korea warmed up, but the sixteenth century witnessed a return to open warfare when the powerful Japanese ruler Toyotomi Hideyoshi (r. 1585–1598) ordered an invasion of Korea. This conflict involved the navies of Japan, Korea, and China. Japanese forces landed unopposed in Pusan Harbor, but the Koreans, with assistance from the Ming emperor, were able to keep the invaders from taking the peninsula, and the expedition was abandoned after Hideyoshi's death in 1598.

One of the most fascinating maritime developments of this period of naval warfare was the emergence of the Korean turtle ship under the command of the celebrated Korean admiral Yi-Sun-sin (1545–1598). This unusual ship design enclosed the entire superstructure under spiked boards and was probably first introduced in response to Japanese pirates. Known as the

p'anokson, these armored, sailed, and oared vessels were solidly built and capable of ramming but also carried forward-, rear-, and side-mounted cannons. A dragon's head was placed on the prow, purportedly with a cannon mounted in its mouth. Korean cannons of this period were carriage-mounted and fired stone or iron shot or a large wooden arrow with an iron head and leather or iron fletching, the largest of which were 9 feet (2.7 meters) in length. These arrows were preferred over shot due to their increased range and were very effective against the primarily wooden vessels of the Japanese. Contemporary accounts also claim that these shafts could be easily converted to fire arrows. In battle, this warship advanced in the vanguard of a fleet, breaking up the enemy line with close-range cannon fire, and then withdrew quickly. This type of capital ship was quite expensive, and there is no record of more than five operating in a single engagement. The well-armed and armored turtle ship has been associated with Korean self-determination ever since and is a powerful reminder of the Hermit Kingdom's successful defense against Japanese imperialism.

Armies of Japan

The administrative and ideological models that Japan's rulers had imported from Tang China in the 700s included an army of conscript peasants. This had rapidly proved both unaffordable and impractical, given that the roles for armed force in Heian Japan were limited to campaigns in the north against the indigenous peoples there, for which smaller, more professional forces not tied to the land were more useful, and to internal

➤ SAMURAI—TERMINOLOGY AND MYTHOLOGY

The word *samurai* derives from the verb *saburu* (to serve), and originally meant simply a retainer of any sort. It came to be associated especially with military retainers and, in Western historiography, with Japanese elite warriors generally. The problem is, “samurai” really has no connotation of elite status. It was the term *bushi*, from *bu* (warrior) and *shi* (class) that denoted the elite warriors of the Kamakura and Ashikaga eras. And not all bushi were retainers, so bushi and samurai were at best limited synonyms in Kamakura and Ashikaga times. The problem was reversed with the rise of the mass armies of the sixteenth century: now, not all samurai, the armed retainers of the *daimyo* (land-owning noblemen), were bushi—indeed, very few had elite status, and many (including Toyotomi Hideyoshi, the unifier of Japan) rose from very modest origins.

The synonymy of the terms really dates to the beginning of the Tokugawa era (1614–1868), when the rulers of Japan froze social mobility and restricted the right to bear arms to those already serving as *daimyo* retainers. Thus, retainer and elite warrior became the same. Tokugawa writers also invented *bushido*, the supposed code of warrior behavior that idealized Kamakura and Ashikaga warriors as always loyal, brave, and willing to die for their lords, and raised the samurai sword to a cult item. This had far more to do with Tokugawa social politics than with the Horse and Bow warriors of 1000–1500.

—Stephen Morillo

policing, for which conscript infantry were ineffective. Thus, by 1000 CE Japanese armies were composed of small groups of warriors drawn from rural, provincial elite families, retained both by the central court and the civil aristocratic families who resided in the capital at Kyoto. Warfare was their profession and their lifestyle. Their main weapon was the bow, which they used from horseback. Mobility and firepower made them ideal for offensive campaigns in the north and for chasing bandits, many of whom were other members of the same emerging warrior class, the *bushi*. The difficulty of using the long, asymmetrical and relatively weak Japanese bow from atop smallish, ill-tempered horses that

lacked stamina made this style of warfare difficult to master, and skill at the Way of Horse and Bow therefore served as a marker of status. Provincial warrior families were inferior to court aristocrats and derived the legitimacy of their military actions solely from orders issued by the central government. But these “teeth and claws” of the courtly elite were clearly superior to the peasantry. The best tended to come from the good horse-raising country of the eastern Kanto plain around modern Tokyo.

The deep political divisions that split the court in the twelfth century also split the warriors supporting the courtly factions, and in the Gempei War of 1180–1185, Minamoto Yoritomo, a leader of a large network of eastern warriors, used a commission from the imperial government to defeat his enemies and establish the *bakufu*, or “tent government,” at Kamakura, with himself appointed as Sei Tai-Shogun, or “barbarian-suppressing generalissimo.” But the establishment of the Kamakura shogunate in fact did little to change the structure of military forces in Japan. The legitimacy of military actions still derived from imperial sanction, even if now filtered through the shogunal administration, which existed in parallel to the civil bureaucracy still centered in Kyoto. The shogunate’s judicial mechanisms regulated the everyday disputes of the warrior class, but military action was still predominantly a matter of small-scale policing actions and was organized around the clan connections of the Hojo, the family of Yoritomo’s wife, who ran the shogunate after Yoritomo’s death.

Only four times did the Kamakura shogunate have to call out substantial armies. The first time, in the Jokyu War of 1221, a large mustering of Hojo vassals easily defeated an attempted revolt against shogunal rule organized by the retired emperor, Go-Toba. The next two times, in 1274 and 1281, were probably the high points of Kamakura military achievement, as warriors from all over western Japan, few of whom were direct Hojo vassals, answered Kamakura’s call to repel the Mongol invasions of those years. Mongol disciplined mass action and firepower surprised the Japanese in 1274 (the Japanese ethos being more oriented towards individual action and glory-seeking, and the Mongol composite bow

having superior range and penetrating power), but the famed *kamikaze* (“divine wind”) typhoon largely wrecked the invasion. In 1281 the Japanese showed they had learned, entrenching themselves behind walls surrounding the landing site and displaying improved group cohesion.

The problem for Kamakura was that the defensive nature of these wars provided them no land with which to reward the claims of those who had fought, and the political decline of the shogunate followed its success. In 1331 the emperor Go-Daigo raised a revolt against Kamakura. This succeeded in bringing down the shogunate but failed to restore direct imperial rule as Go-Daigo had planned. Instead, Ashikaga Takauji, a defender of Kamakura who switched sides, eventually established a new shogunate while the imperial family split, leading to sixty years of confused civil war. During this time, individual warriors and fighting styles continued unchanged, but larger patterns of war shifted from battle-seeking to skirmishing and warfare based around holding and besieging small fortifications. An uneasy order was restored in 1392, but though warriors now ruled almost unfettered by imperial or court rivals, they also lacked legitimacy. Eventually, the leading warrior families, now located in Kyoto with the Ashikaga shoguns, destroyed themselves in the Onin War (1467–1477).

It was in this context of fragmented political authority and competition among the second rank of warrior families (the *sengoku daimyo* of the sixteenth century) that Japanese armies were radically transformed from small elite forces of cavalry archers into rigorously disciplined professional mass armies of spear- and bow-armed infantry (and by the 1570s musketeers as well) and heavy cavalry. The era of the Way of Horse and Bow was then over.

The Mongol Army

One of the most important institutions of the Mongol empire was the army. After becoming the ruler of the steppes of Mongolia in 1206, Chinggis Khan immediately began to reorganize his nomadic warriors into an army whose feats remain unparalleled today.

As part of this reorganization, Chinggis Khan transformed steppe society from a tribal base into a premodern version of a military-industrial society. Tribes that had opposed him were dispersed among loyal tribes. In addition, all groups were divided along decimal lines. Initially, the primary unit of organization was the *mingan*, or unit of 1,000. These were then divided into a corresponding number of *jaghun* (hundreds) and *arban* (tens). Later, the *tumen* (10,000) increased in importance for the empire’s organization. The households that belonged to these units not only produced the warriors who filled these units but also supplied them with equipment. To make sure that the new system stayed in place, Chinggis Khan decreed that no one could move to a different unit. He also appointed the commanders, who then selected their junior officers.

Chinggis Khan did not invent the system of decimal organization, as it had been common, but as only a form of military organization, among the Khitans, who dominated much of Mongolia during their reign as the Liao dynasty (907–1125) of northern China. In addition, the Kereit tribe that ruled central Mongolia during Chinggis Khan’s rise to power used it. Chinggis Khan, however, innovated the use of it to organize society. By reorganizing society, he broke the tribal divisions that had kept Mongolia in an incessant state of war.

Additionally, Chinggis Khan devised the *kes-bik*, or bodyguard, that became a training ground for not only his generals but governors of the empire as well. Consisting of 10,000 men and divided into dayguards, nightguards, and quiver-bearers, the keshik guarded the khan and served

THE MONGOL BOW

The composite recurved bow of the steppes served as the main weapon of the Mongols. It was a recurved bow because it was strung by bending it against its natural curve. Unstrung, the bow took the form of the letter “C.” Made from composite layers of horn, wood, sinew, and glue, this weapon typically possessed a pull ranging from 80 to 160 pounds, although the latter was a rarity. Due to the bow’s heavy tension and high pull, the Mongol arrow had little problem penetrating even the armor of the knights of thirteenth-century Europe who, until their earlier encounter with the recurved bow in the hands of Turkic light cavalry during the crusades, had been protected against virtually all hand weapons except the crossbow. Years of experience and practice gave the Mongols not only the appropriate strength, as one might gain from lifting weights, but also the proper technique to draw the bow. The Mongol bow possessed a maximum effective range of approximately 300 yards (275 meters). However, archery from more than 150 yards (135 meters) was intended to disrupt enemy ranks rather than inflict casualties. Although the composite bow was an excellent weapon, it did have some drawbacks, such as damp weather being detrimental to it.

Unlike European and Native American shooting styles, the nomads of Central Asia used a thumb ring to pull their bowstring, which prevented strain on the thumb. The Mongols held the bow in the left hand but set the arrow on the right-hand side, as the thumb ring affected how the arrow flew. If placed on the left-hand side of the bow, the shot tended to be less accurate.

The Mongols’ arrowheads were shaped in a variety of forms and made from iron, steel, horn, or bone. Each arrowhead had different functions, such as armor piercing, signal arrows that produced a whistling sound, and knobbed stun arrows.

—Timothy May

as his household staff. A commander, or *noyan*, from the keshik outranked a non-keshik commander by one rank. Thus, a commander of mingan in the keshik held the same rank as a commander of a tümen outside of the keshik.

Initially, light cavalry comprised the entire Mongol army, but as they expanded the Mongols

incorporated other military units into their forces. This included heavy cavalry and siege engineers. Initially the Mongols had little use for infantry but later used them extensively in regions ill-suited for cavalry warfare, such as southern China.

A key force in the Mongol military was the *tamma*. These were special units or even armies that drew upon soldiers from throughout the empire. *Tammacin*, or those who served in a *tamma*, played a vital role in the expansion of the empire because they were stationed on the borders. Their orders were to maintain control of the region and, if possible, extend Mongol control or influence into the neighboring territory. As the Mongols moved forward to conquer new territory, the *tammacin* often served as the army’s vanguard.

The Mongol army steadily grew as it conquered new territories and incorporated conquered groups into the military. Most important of the new additions were Turkic nomads who lived a lifestyle similar to the nomadic Mongols. In 1206 the Mongol army numbered approximately 95,000 men. By 1260 the Mongol empire stretched from the Sea of Japan to the Mediterranean Sea and the Carpathian Mountains and could mobilize approximately 1 million men under arms.

The Armies of Europe

In Europe’s Early Middle Ages (ca. 500–1000), armies were raised by nobles for either themselves or their king. The majority of such forces were composed of volunteers hoping to gain from spoil and plunder, freemen obligated to pro-

vide military service by virtue of their ownership of land, and vassals who owed varying levels of feudal obligations to the nobility. As more centralized governments developed during the Later Middle Ages (1000–1500), significant changes took place in the way armies were raised. This included the more extensive use of mercenaries and led to the development of Europe’s professional armies.

While members of the nobility continued to fight primarily as the result of social and feudal obligations, other soldiers increasingly fought for pay. Although in theory some vassals in the later Middle Ages were obliged to serve their lord annually for up to 40 days in the field, if they had the financial ability they would often pay someone to serve in their stead. The limited service requirements of feudal obligations could also cause severe problems concerning a lord’s ability to sustain prolonged warfare. Once a vassal’s required service was over, he could theoretically withdraw if alternative arrangements had not been made. Thus, in addition to calling up their vassals, wealthier lords and kings often employed mercenaries. Successful use of mercenaries was usually dependent on their morale, as they were prone to flee when battles went poorly or pay was tardy. Finally, cities sometimes recruited armies from local populations or, if recruitment efforts were unsuccessful, raised armies through conscription.

Once an army was raised, the issue of logistics was paramount. Supply was so important that it often determined the makeup and size of armies. Among the most important members of an army’s leadership was the marshal, whose duties included marshaling, or gathering, the forces; organizing the army’s heavy weapons; and providing for the army’s constant provisioning. While all soldiers were responsible for providing their personal arms and armor, the leadership was obliged to provide weapons beyond the pocketbook of the common soldier, such as siege engines. Moreover, although soldiers would bring an initial supply of rations for themselves, the army’s leadership was responsible for plotting a route that allowed for resupply. This was done by maintaining supply chains, purchasing supplies from local populations, or, more often than not, foraging (plundering). Whatever the means

➤ SACK OF LIMOGES, 1370

The following, taken from the *Chronicle* of Jean Froissart (ca. 1337–ca. 1410), describes the capture and sack of Limoges in 1370 during the Hundred Years’ War (1337–1453). Although the author was not present at the battle, this selection claims to record the successful siege tactics as well as the brutal treatment of the town’s conquered populace, employed by English forces under the leadership of Edward, the Prince of Wales, known as the Black Prince.

“[Having mined under the town walls] the miners set fire in their mine, and the next morning, as the prince had ordained, a great piece of the wall fell and filled the moats, whereupon the well armed Englishmen in the field were glad and poised to enter the town. The foot soldiers entered at their ease and ran to the gate and beat down the fortifications and barriers, as no one was there to defend against them because it was done so suddenly that the town was caught unaware. Then the prince . . . and all the other [leaders] with their companies entered into the city. The foot soldiers were equipped to do evil, and to pillage and rob the city, and to slay men, women, and children who kneeled before the prince for mercy. But he was so inflamed with ire that he took no heed of them, but put all of them to death. There was no pity taken on the poor people . . . for more than 3,000 men, women, and children were slain that day.”

of provisioning, food and drink were a constant worry and often in short supply.

Medieval European armies were normally arranged in three sections (battles or battalions) that included a vanguard, a main body, and a rear guard. The vanguard was the forward division of the army, usually comprised of archers and other soldiers who wielded long-range weapons. Their purpose was to inflict as much damage as possible on an opposing army before the main bodies, composed of infantry and armored

cavalry, clashed. The main body comprised the bulk of the army's forces, and its performance was usually crucial to the army's success. The rear guard was usually comprised of less heavily armored and more agile cavalry, often mounted sergeants who could move quickly around the battlefield and chase down fleeing enemy soldiers. It also guarded the main force's rear as well as the army's supplies and camp followers (noncombatants who accompanied the army). Each section deployed in either a linear or block formation depending on the situation on the battlefield. While a block formation could better withstand cavalry charges, a linear formation allowed nearly the entire army to take part in a battle.

The importance of the mounted knight in medieval armies was foundational to Europe's social order. The prohibitive cost of proper arms, armor, and horses limited knighthood primarily to the landed feudal class. The typical knight was generally much more effective on the battlefield than the common infantryman, as he was not only better equipped but also better trained. Knights were usually placed in command of the cavalry (many of whom were less well-armed sergeants from lower social classes), which was used primarily to overrun enemy positions and break up enemy formations. If the cavalry charge was successful, infantry was positioned to exploit any break in the enemy line.

The infantry was composed of pikemen, archers, crossbowmen, swordsmen, and others who fought on foot and were usually joined by knights and other cavalry who had lost their horses. While some infantry were experienced warriors, many were poorly trained and only sporadically went into combat under the leadership of their local lords. Pikemen defended against enemy cavalry by pointing a concentrated number of pikes (long spears) in the direction of an onrushing cavalry charge, while archers could fill the sky with arrows to devastate the ranks of their approaching opponents. After several volleys, the archers could step aside to allow the cavalry and other infantry to engage their then-weakened opponents. When the main bodies of two armies clashed on the battlefield, infantrymen armed with swords, battle-axes, and similar

weapons provided screening for the cavalry and were essential for hand-to-hand combat. As the battlefield became chaotic, communication was usually limited to audible commands (sometimes produced by musical instruments), messengers, or visual signals that included the use of banners, standards, or flags.

The development of effective siege warfare was necessitated by the common use of defensive walls to protect medieval cities. Many cities also contained a keep, or elevated fortification, for additional protection in case the walls were breached by an enemy. Medieval strategists understood that the most effective way for an army to overcome defensive walls was simply to knock them down and rush through any openings. This was less risky than maneuvers that involved scaling ladders while fending off the attacks of defenders who benefited from their elevated position. Consequently, a variety of powerful siege engines that included the mangonel, the ballista, and the trebuchet were used to launch heavy projectiles at resisting cities and batter their defenses. Additionally, attacking armies used siege towers to position soldiers on a level equal to those defending a city wall, while forces on the ground would also employ battering rams to knock down gates or sappers to undermine walls.

Archers also played an important role in siege warfare. Talented marksmen could wreak havoc on the opposing armies of both sides. The skill and range of archers defending a city's walls determined the placement of the attacking army's camp, as it was important to make sure that the attackers were out of range of arrows. In the case of those who used the powerful English longbow rather than the more common short bow, archers had a much higher rate of fire and effective range, which made them especially valuable for use in siege warfare and by the vanguard on the battlefield.

Technological developments also aided armies defending cities or castles under siege. Concentric castles were developed during the period of the crusades, as were architectural improvements, such as the round tower, to make walls stronger and more defensible. Deeper wells allowed better access to water during lengthy sieges, and small openings in the wall for defending archers

provided them protected positions. Attackers were also repelled from city walls with boiling oil or water as well as molten lead. Yet the most revolutionary changes in tactics, strategy, equipment, and organization emerged with the introduction of gunpowder to European battlefields in the fourteenth century. Powerful cannon tipped siege warfare in favor of the attacking army, while hand cannon and other firearms made the armor of knights obsolete. This led to the diminished importance of the mounted nobility, which contributed to the rise of full-time professional armies in the early modern period.

The Peoples' Crusade of 1096

The First Crusade had strong popular support. Along with the Church's clergy, unauthorized preachers propagated the ideology of holy war to the masses. One of the most important from this latter group was Peter the Hermit, a charismatic leader who, during the summer of 1096, wandered around northern France and the Rhineland inspiring a great many, especially from the lower social classes, to join the expedition to Jerusalem.

Likewise, the passage of crusade pilgrims through Europe in 1096 stimulated additional religious fervor. Pope Urban II had not made any reference to European Jewry while preaching the crusade. Common people, unfortunately, were not able to reconcile the principle of domestic toleration with the idea of holy war against Muslims in the Holy Land. The ideology of divinely ordained violence in the name of Jesus Christ on

Peter the Hermit preaching the People's Crusade of 1096. (Pixel That)

one hand and the ideal of a united, homogenous Christendom on the other did not encourage toleration of non-Christians in Europe's heartland.

In the Rhineland and elsewhere, anti-Semitic notions led to serious outbursts of violence. Some local Christian bishops intervened to protect the Jews of their cities, but except for the town of Speyer, the bishops were not able to control public anger. In Rouen, Worms, Mainz, Cologne, Trier, Metz, Regensburg, and Prague a significant number of local Jews lost their lives, many at their own hands or at the hands of loved ones, as they sought to avoid forced baptism.

These attacks were typically orchestrated by local townspeople or a haphazard coalition of burghers and crusaders. The assailants were often determined to convert the Jews, and in general those Jews who accepted baptism could

> TAFURS

The First Crusade produced a popular legend of King Tafur, who together with his rag-tag army fights his way through the countryside devastating, raping, and killing until no one is left alive. During periods of famine, they were reported to eat enemy corpses. The legend seems to bear some resemblance to elements of the People's Crusade as well as some groups within the main crusade armies that came later. Crusade historian Guibert of Nogent describes the Tafurs as poor and desperate crusader pilgrims led by a Norman knight who had lost his horse. In the twelfth-century poem *La Chanson d'Antioche (The Song of Antioch)* Tafurs are depicted fighting with stones and maces without any protecting equipment. The poem proceeds to describe them as horrible people who grind their teeth while attacking the enemy.

—Sini Kangas

spare their lives. In most cases, the aggression arose spontaneously. Distinguished local knights and burghers of high social standing typically took part in the persecutions, and few if any of them then proceeded to the Holy Land.

An exception to this general pattern was Mainz, where an ideologically committed and organized crusader army initiated the persecution. The Jewish community of the town was large and firmly established, and it seems likely that Count Emicho of Leiningen, who was in command of the crusade army that had marched to the city in May, carefully planned the attack and intended from the beginning to eradicate the Jews of the city. When the archbishop's soldiers fled, the Jews were left unprotected, and the vast majority of them died in the resulting carnage. After rioting around northern Germany, the army of Count Emicho was routed and dispersed by local Christian resistance in Hungary along with two other armies from Germany, each led by an unauthorized priest.

Peter the Hermit, who apparently was never an ordained priest, was a controversial figure in his own day and is still able to divide opinion sharply. Some modern historians credit him as an initiator of the crusade (along with Pope Urban II), while others see him as a maladjusted

opportunist. On the arrival in Trier of his contingent of the People's Crusade, Peter presented the leaders of the Jewish community with a letter from French Jews, who advised their brethren to financially support Peter and his army. In return, the crusaders would refrain from violence. An agreement was made, and Peter and the crusaders departed peacefully.

While the crusade princes were still gathering their forces back in Europe in early August 1096, Peter and his followers, in the company of a second crusade contingent led by the knight Walter Sansavoir, had already crossed the Bosphorus from Constantinople into Asia. After their hasty departure from the Byzantine capital, where these early crusaders had been sacking the palaces of the city and stealing the lead from the roofs of the churches, the People's Crusade was annihilated in Civetot by the Turks. Some survivors returned to Constantinople, where they joined the crusade proper. In the end a few of them, including Peter, reached the Holy Land.

Armies of the First Crusade, 1096–1099 (or 1102)

Traditionally the First Crusade has been dated between the spring of 1096, when the first crusader armies set out from Europe, and the summer of 1099, when crusaders captured Jerusalem and then successfully defended their gains over

Fatimid forces from Egypt. The First Crusade, however, was an extensive popular movement. Depending on scholarly perspective, the definition may also be extended to the People's Crusade (1096) and the so-called Crusade of 1101 (1100–1102).

The main force of the First Crusade consisted of four separate armies, which left Europe between August and October 1096. The leaders belonged to the elite of the Western nobility. Compared to many later crusades, however, there were no kings among them.

The Lotharingian contingent from northwestern Europe was led by Godfrey of Bouillon, later hero of the expedition, and his brothers Eustace and Baldwin. The second force from Normandy, Flanders, and Central France marched under Robert Curthose, the eldest son of William the Conqueror, the king of England, as well as under Robert of Flanders, Stephen of Blois, and Hugh of Vermandois, the brother of the excommunicated king of France.

The third and largest army came from southern France, commanded by the exceedingly rich Raymond of Toulouse, who traveled with Bishop Adhémar of Le Puy, the papal legate, or envoy, to the crusade. Normans of southern Italy constituted the fourth contingent. They were led by the ambitious Bohemond of Taranto and his nephew Tancred, who was not yet 20 years old.

During the crusade, allegiances often changed. The same applied to social standing; mounted warriors who lost their horses were demoted to foot soldiers, and some common soldiers were raised to the status of either mounted sergeant or knight. Moreover, Pope Urban II's apparent attempt to restrict the crusade to men equipped to fight was not successful. A large number of noncombatants accompanied the armies on this journey to the Holy Land. Many warriors took their families with them, and additionally a great number of people from all social groups joined the expedition. In all, the First Crusade was a fluid entity, and the division between combatants and noncombatants was constantly shifting. One commonality, however, bound them all. Given their goal—Jerusalem—and the spiritual benefits promised them for their efforts, each person, regardless of sex or social status, was a pilgrim.

➤ WOMEN ON THE FIRST CRUSADE

Women were not encouraged to join the crusades. In his initial crusade sermon on November 27, 1095, Pope Urban II appears to have prohibited any woman from leaving without a legitimate guardian. A good two years later, Symeon, Greek patriarch of Jerusalem, stated in a letter to the West that only men should go on crusades.

At the same time, women could not be denied the ancient penitential practice of a Jerusalem pilgrimage on any theological grounds. Besides, medieval armies conventionally had women following the rear guard. Many of them traveled under the protection of a husband or a relative, but a certain amount of independent women were always present as cooks, washerwomen, merchants, or prostitutes.

In the male-dominated sources of the First Crusade, women are found in auxiliary roles carrying water or missiles into battle, taking care of the wounded, and lamenting for lost ones. The repertoire of feminine figures is wide-ranging. At one end of the spectrum, there is the noble and outstandingly beautiful Ida of Austria who, according to a legend not to be believed, was taken captive at the Battle of Heraclea in 1101 and taken to a harem, where she gave birth to Zengi, the great hero of jihad. At the other end, there is the reality of a dull-eyed mother who has left her starving baby behind on the long road to Jerusalem.

—Sini Kangas

The four armies took different routes to their agreed meeting place, Constantinople, which they reached separately between November 1096 and mid-May 1097. From Constantinople the army marched through Anatolia (present-day Asian Turkey) and Syria to Palestine. It was a long journey laden with internal strife, hunger, thirst, disease, and continuous skirmishes with the enemy. During the seven-and-a-half-month siege of Antioch, which lasted from October 21, 1097, to June 3, 1098, crusaders met their physical limits. The winter of 1097–1098 was extremely cold, the lack of food escalated into famine, and infectious diseases reaped grave harvest among the ranks. When Anselm of Ribemont wrote back home in November 1097 begging prayers for his deceased companions, he mentioned that 6 out

of 13 had died of disease. Anselm's list includes only adult males from the higher social classes, which suggests a very high mortality rate among women, children, and the poor.

The outcome of the crusade echoed its expectations. Crusader victories at Antioch and Jerusalem, which they captured by storm on July 15, 1099, were seen by contemporaries as miracles, and crusaders returning from Palestine were the champions of Christ and the Holy Sepulcher (Tomb of Christ), which they had liberated from the hands of unbelievers.

The reception was quite the reverse, however, for the many who had deserted while the crusade was under way, including the crusade leaders Stephen of Blois and Hugh of Vermandois, who were excommunicated by the Church and despised by their families. When a new crusade expedition set out in 1100 in order to reinforce the newfound kingdom of Jerusalem, both saw in it an inviting second chance to redeem themselves and their crusade vows.

The so-called Crusade of 1101 ended in disaster. The main force, consisting of peasant Lombards allied with French, Burgundian, and German crusaders, was crushed at the Battle of Mersivan in August 1101 on its way to free Bohemond of Taranto, who was held captive by the Turks in Niksar. The same fate awaited two other contingents, one led by Count William of Nevers and the other consisting of crusaders from southern France and Bavaria. Both were ambushed during their march through Anatolia. Mortally wounded, Hugh of Vermandois died shortly thereafter. Only remnants of the two armies reached Jerusalem. Stephen of Blois did not live to see his lands either. After celebrating Easter of 1102 in Jerusalem, he sojourned in Jaffa waiting for a favorable wind to sail back home. There he received the news of an approaching Egyptian force and decided to stay. The meeting of Frankish and Egyptian forces at the Battle of Ramla in May 1102 ended in Muslim victory, and Stephen was killed, probably executed together with the majority of Christian captives.

Thirteenth-Century Crusader Armies

By the thirteenth century, the European crusading movement had evolved far beyond what Pope Urban II (r. 1088–1099) had declared at Clermont, France, in 1095. Originally intended for fighting the Muslim infidels in the Holy Land, the thirteenth-century version of crusading became interpreted much more broadly and resulted in armies attacking not only infidels in the Near East but also accused heretics and other sects of Christianity within Europe.

The leaders of the Fourth Crusade (1202–1204) had planned to go to Egypt, but a shortage of funds to pay for their trip found the crusaders entangled in the regional power politics of Venice, the Balkans, Hungary, and the Byzantine empire. At the instigation of the city-state of Venice, the crusaders attacked and conquered the Christian city of Zara (present-day Zadar in Croatia), for which Pope Innocent III (r. 1198–1216) excommunicated the entire army. Nevertheless, the crusaders continued south and east, attacking the capital of the Byzantine empire, Constantinople, in support of the deposed emperor Isaac II (r. 1185–1195 and 1203) and his son, the future Alexius IV (r. 1203–1204). Burning and looting of the city followed, and much of the population fled; the Byzantine capital never recovered.

Another crusading movement took place not in the Holy Land but in southern France against Gnostic heretics known as Albigensians (1209–1229), also called Cathars and Bogomils. King Philip II Augustus of France (r. 1180–1223) initially resisted the urging of Pope Innocent for a crusader army to attack the Cathars but finally agreed to cooperate, at least passively. A crusader army of largely northern French moved south in 1209 and on July 22 captured the town of

➤ LOUIS IX AND THE TWO QUEENS

King Louis IX, whose father and royal predecessor, Louis VIII (r. 1223–1226), died when Louis was 12 years old, grew up under the control of his mother, Blanche of Castile, and her influence on Louis and the French court lasted until her death in 1252. From 1126 until Louis reached his majority in 1234, the queen mother served as regent for her underage son and was instrumental in defeating both a coalition of French nobles, who sought to weaken royal authority during Louis's minority, and the attempt of King Henry III to recover lands in France lost by his father, King John, to Louis's grandfather, King Philip II.

In 1234 Louis, then 21 years of age, married the 13-year-old Margaret of Provence in a marriage arranged by Queen Blanche. His mother and his equally strong-minded wife did not get along well, and the queen mother did everything she could to keep the royal couple separated. The attempt was not totally successful. Margaret bore Louis 11 children, 3 of whom were born during the Seventh Crusade (1148–1154), apparently a crusades birth record. Probably in part because of Margaret's desire to be her own woman and probably also because of the force of his mother's personality, Louis and Margaret never developed a complete bond of marital affection.

Notwithstanding this coolness, Margaret accompanied Louis on his initial crusade and

proved to be one of the ablest and most heroic crusaders in his retinue. In 1250 on the very day she had given birth to a son and only three days after hearing of her husband's capture in the Nile Delta, Margaret took control of Damietta and prevented its premature abandonment by the panicked Latins who had remained behind in the city. Her quick and decisive action allowed the city to be used as a bargaining chip in the negotiations that led to Louis's ransom and release. After spending the next four years in Palestine with Louis, she sailed for home with him in 1254. During the homeward journey, her quick reaction in suppressing an onboard fire saved the ship and the lives of its crew and passengers.

Queen Blanche had disapproved of Louis's crusading, but before her son left for the Holy Land in August 1248 he appointed his mother regent of France. Once again, her personality and talents proved more than equal to the task. Age and infirmities finally caught up with her, however, and she died in November 1252 more than a year before her son returned home.

Queen Margaret apparently disapproved of Louis's second crusade and did not accompany him to Tunis. Following his death there, she lived on as dowager queen until 1295.

—April L. Najjaj

Béziers, where it killed an unknown number of Cathar believers and Catholics alike and then besieged and captured the key city of Carcassonne, where the reconstructed fortress stands today. Although the commander of the Crusading army, Simon de Montfort, was killed in 1218, the conquest continued and resulted in large-scale confiscations of property, allowing for considerable expansion of French monarchical authority in the south. Once defeated, the Albigensians became one of the first heretical sects to be tried by the newly created Inquisition.

Philip Augustus's grandson Louis IX (r. 1226–1270) also played an important role in the thirteenth-century Crusading movement, as he led two separate crusading efforts aimed at liberating Jerusalem by way of North Africa. The first,

Louis IX of France disembarks at Damietta during the Seventh Crusade, from Grand Voyage de Hierusalem, published 1522. (Jupiterimages)

referred to by historians as the Seventh Crusade, took place in Egypt during 1249–1250; his second effort, the Eighth Crusade, began and ended in Tunis in 1270. Both failed and made little lasting impact on European control of the region.

With the Seventh Crusade, Louis's armies landed in Egypt and conquered the coastal city of Damietta in June 1249. However, their success proved to be short-lived, as the yearly flooding of the Nile River had made travel difficult. As the army attempted to capitalize on its victory and move farther south, they became confused navigating the many different branches of the river, and the Egyptians not only defeated the crusader army but also took Louis and many of his noblemen prisoner. The king's wife, Margaret of Provence, had traveled with Louis, and she negotiated the surrender of Damietta and the release of Louis after payment of a hefty ransom. With their freedom, Louis and his entourage continued east into the area of Palestine and arrived later in 1250. He and his army stayed in the crusader fortress-city of Acre for four years helping to build up the remaining Christian fortifications in the Latin Kingdom; he returned to France in 1254.

The Eighth Crusade is considered one of the last efforts that could still be described within the medieval tradition of the Christian crusading movement. The Mamluk sultan in Cairo, Baybars (r. 1260–1277), had captured the Christian outpost of Antioch in May 1268. Despite his age and poor health and against the advice of many of his noblemen, Louis decided to take up the cross a second time and traveled with his three sons to North Africa. Louis's brother, Charles of Anjou, king of Sicily, had wrongly advised Louis that the emir of Tunis would be sympathetic to the crusaders' cause and would allow Christians to set up a base of operations for an attack on Egypt. However, upon arrival in North Africa in 1270, Louis and many of his men died from disease. The crusade fell apart at Louis's death, and his army returned to France without ever arriving in the Holy Land.

The Inca Army

As an empire based on conquest, the Inca state depended on military power for its existence, and warfare was a primary occupation for the ruler and the highest-ranking nobility. All young Inca males were trained in the military arts as part of their basic education. Each ruler was expected to expand the empire and demonstrate success in war as evidence of his fitness to rule.

The size of the Inca armies was astonishing even by modern standards. Sources disagree on exact numbers, but all agree that armies numbering between 35,000 and 140,000 men were raised on various occasions, with several large armies in the field at once. Maneuvering a body of men this large requires phenomenal organizational ability. The highest-ranking officers were more or less professional soldiers and came from the Inca nobility. Lower-ranking officers were drawn from the ranks of traditional tribal rulers. Common soldiers were drafted from the masses and participated as part of their labor tax obligation. They were only provided with food, clothing, and arms as payment. In order to keep production stable while so many men were occupied on military campaigns, only a few men from each village were called up so that their kinsmen could easily work their lands for them in their absence.

Within the army, divisions of different sizes were organized based on ethnicity. Units were placed in marching order depending on their reliability and how long they had been under Inca dominance. Troops from the most recent conquests were placed in the front of the line at the greatest distance from the Inca ruler.

Discipline within the Inca armies was strict. Movement was exclusively on foot except for the highest-ranking generals and the emperor, who were carried in litters. On the march the men were kept in ranks and were closely supervised, and looting, pillaging, and straggling were not tolerated. Cowardice or flinching in the face of the enemy could be punished by death.

Inca armies employed a variety of weapons for both long-range and hand-to-hand fighting. All of their weaponry could be classed as light armaments since they did not employ heavy artillery of any sort, nor did they use siege engines. Whole units were equipped with a single type of weapon, and thus there were squadrons of archers, slingers, spearmen, and so forth.

For long-range combat various weapons were available, with slings, which could fire small stones with great accuracy, being perhaps the most common. Bows and arrows were used by some units, while others used spear throwers and javelins. At a closer range, bolas were used to entangle the legs and feet of the enemy, and stones were thrown or rolled down from a high position onto attackers.

For close-quarters combat the preferred weapon was a short club called a *champi*, which was about 2 feet (60 centimeters) to 3 feet (1 meter) in length with a heavy weight on one end. This type of weapon has been called the star-headed mace because its weight of bronze or stone was donut-shaped with five or six projecting knobs on its perimeter, resulting in an asterisk or star shape. Another type of club, the *macana*, was made of the hard wood of the chonta palm and was shaped like a sword, being about 4 feet (1.2 meters) in length with a maximum width of 4 inches (10 centimeters). Battle-axes, ax-mace combinations such as European halberds, and spears with metal points were also used in hand-to-hand fighting.

The battle equipment of Inca soldiers included more than weapons. Soldiers wore tunics and sandals, much like their everyday wear, but added to that was a type of armor made from quilted cotton and wrapped in lengths of cloth around the body. On their backs warriors wore small round shields made of woven palm-wood slats and cotton. They also carried a larger rectangular shield covered with a decorated cloth that extended below the shield itself as a banner. The soldiers' heads were protected with helmets of wood or canes strong enough to withstand heavy blows. Over their defensive armor the soldiers wore their finest clothing and ornaments, such as what they wore on holidays and festivals.

—Gordon McEwan

➤ INCA MILITARY LOGISTICS

The art of military logistics was highly developed in the tightly organized Inca empire. In order to move and supply such large armies, the Inca provided for the storage of enormous caches of food, weapons, and other supplies, such as tunics, helmets, sandals, and tents, at key administrative centers and at *tampu* along the royal highway. This allowed the army to move without having to carry all of its supplies and provided spares and replacements as necessary. Most importantly, this allowed the army to be fed without placing any burden on the provinces through which it moved. Unlike contemporary European armies that lived off the land and often despoiled even their own territory, Inca armies did no damage to the landscape, towns, or facilities that they passed.

Once the army left the borders of the empire and began a war of expansion, it was supplied by llama trains and large groups of human porters; added to this was any food that it might capture. The people drafted for this duty were only required to carry for a fixed distance and rotated frequently so as to spread the burden evenly. Inca armies also moved with many camp followers. Individual soldiers had wives or relatives accompany them to look after their daily needs and, more importantly, to care for them if they should be wounded or sick.

Evidence for Warfare in North America

Although warfare most certainly took place in North America between small groups throughout the Holocene era, which began about 11,000 years ago following the last Ice Age, evidence is largely lacking until the latter part of the period. This is because it is difficult to establish whether the archaeological evidence specifically supports warfare or some other phenomenon. Two lines of evidence—defensive settlements and injuries in human skeletal remains—have been used in archaeological reconstructions of violence and the establishment of prehistoric warfare. The burning of sites and settlements has also been important for identifying the consequences of war and investigating more subtle aspects of strategy and directionality. Weaponry and iconography have provided important but more limited insights into warfare in North America. Although considerable disparities exist between North American regions in the archaeological evidence for intragroup and intergroup violence, all regions show a marked increase in

warfare around 1000 CE, toward the end of the Archaic period.

For example, warfare intensified in the Bering Strait region of the Arctic circa 1000–1400 CE, with the development of complex social organizations that involved the control of marine resources from coastal promontories. Archaeological data indicate that several different social groups fought each other over access and control of resources in the region, as evidenced in over 800 burials from the Point Hope, St. Lawrence Island, and East Cape regions.

On the contrary, in the Plains region of North America evidence indicates that warfare developed in response to indigenous cultural-ecological processes rooted in unpredictable environmental fluctuations and population-to-resource imbalances. Because the environmental conditions of the Plains region fluctuated greatly during the Holocene era, people had to move from area to area. This process brought various groups into conflict with each other. In the Plains, warfare occurred as a result of these different groups coming into contact with each other, while in the Bering Sea evidence indicates that warfare occurred as a result of resource competition. In the Southeast region, warfare was also conducted over access to resources, although the resources in this region were not migrating animal populations but instead fertile valley bottoms.

During the Mississippian period in the Southeast (ca. 800–1500 CE), for example, evidence indicates that warfare was the result of a struggle over the fertile silt and sandy loam bottomland soils and was instituted to increase the agricultural territories of demographically expanding Mississippian groups. On the contrary, in northeastern North America skeletons of victims and remains of palisaded settlements—the only information consistently available for intergroup hostilities for the region—indicate that the prevalence of conflicts varied greatly over time and space. Evidence further indicates that occasional attacks, typically ambushes of small numbers of people, cumulatively resulted in numerous casualties. Likewise, variation in palisade strength is consistent with the organizational structure and demographics of late prehistoric societies for

WARFARE IN THE SOUTHEAST

During the Late Woodland period in the North American Southeast region (ca. 500–1000 CE), evidence indicates that relatively large-scale forms of intergroup warfare took place. This period was characterized by population increases, growths in settlement size, and the saturation of the landscape with scattered family groups and small communities. As a result of these factors, prehistoric peoples of the Southeast region during this period constructed palisaded villages as a defensive measure against the increasing intergroup warfare. Furthermore, several small triangular arrow points have been found embedded in human skeletal remains from the period, indicating that peoples of the region were in regular conflict with other groups. Because these arrow points were manufactured from nonlocal chert, it has been concluded that warfare took place on an inter-regional scale and was not confined to just a few communities in one region.

—Peter N. Jones

the region, supporting the conclusion that warfare was prevalent in the region.

■ Introduction: Diplomacy around the World

Some Western historians have claimed that the craft of diplomacy was essentially born amid the shifting political alliances wrought by Italian polities during the period circa 1300–1600. That is nonsense. Without denying the sophisticated diplomatic protocols employed by these states, it is no exaggeration to say that a number of states had raised diplomacy to a high art long before the year 1000, and this was particularly true of the Chinese, Abbasid, and Byzantine empires. Moreover, after 1000 CE, not only did China, Byzantium, and established Islamic states, such as the Fatimid empire, continue to use and refine their diplomatic skills and traditions, a number of emerging states in Afro-Eurasia were employing to great effect the tools of long-distance diplomacy. These included, but were not confined to, the Roman papacy, the trading empires of sub-Saharan West Africa, the Holy Roman empire, the Seljuk Turkish states of Anatolia and surrounding regions, and the Inner Asian polities carved out by the Mongols in the thirteenth century and by the Timurids in the fourteenth and fifteenth centuries. And then there was one of the most dramatic series of diplomatic (and military) expeditions of this entire half millennium: the seven early-fifteenth-century

voyages of Zheng He, an unambiguous effort to project Ming imperial influence into the lands washed by the waters of the Indian Ocean and adjoining seas.

Obviously the few entries that appear within this topic do not accurately reflect the range and depth of diplomacy being practiced across Afro-Eurasia in the period 1000–1500, but even the few essays that do appear here allow us to say with confidence that diplomacy was alive and well across this great landmass.

Diplomacy was also not confined to the states of Afro-Eurasia. The pre-Conquest Americas also witnessed diplomatic exchanges and alliances of great significance. Efforts have been made to place the origins of the Iroquois Confederacy of Five Nations (later six), which Longfellow's *Song of Hiawatha* has made famous, as far back as the late fourteenth century. Analysis of the oldest excavated smoking (or peace) pipes, however, points strongly to a date no earlier than about 1590. Despite this inconvenient inference, as some disappointed mythmakers would see it, if we look farther south, into Mesoamerica and South America, we can find unmistakable evidence of well-established and effective diplomatic traditions well before the arrival of

Europeans, as several entries under this topic point out.

As already noted, the art of employing diplomatic means to represent the interests of a state or ruler predated 1000 CE and, indeed, long predated the Common Era. During the period 1000–1500, however, the number of polities employing this device expanded significantly around the world, and the techniques of diplomacy also became more refined.

China's Border Policies and Diplomatic Tactics

China's diplomacy on its frontiers gained allies or neutralized foes by recognizing the status of border peoples in return for their loyalty and through tributary relations. The Chinese had developed payment of tribute, a common fruit due any superior power, into a system and enforced it when they could, whereby inferiors kowtowed to the Chinese emperor, offering gifts. The Chinese emperor, as the Son of Heaven, responded with generous presents.

The tribute system reinforced China's prestige and a Chinese-centered view of the world. The tribute system was an ideal that never entirely reflected the complexity of Chinese diplomacy and policy. Basically, the Ming tribute system restricted contact with foreigners, with the exception of the expansion of contacts by the Yongle emperor in the early fifteenth century.

In a reversal of tribute roles, so-called barbarian northern peoples forced the Chinese Song dynasty (960–1279) to pay it to them. The Song gave tribute to the Khitan Liao dynasty (907–1119) from 1004. Modeled on the treaty with the Liao, the Song agreed to pay tribute to the Tangut XiXia state in 1044. The Jurchen Jin dynasty (1115–1234) ended the Northern Song in 1126 and made the Southern Song (1127–1279) pay tribute in silk and silver in 1141. To show its sincerity to the Jin, the Song court also executed Yue Fei, one of its more capable generals in the war against the Jin, who is today a symbol of Chinese patriotism. Expensive as it was, the militarily weak Southern Song rationalized that the payment of tribute was less costly than continuing war. All the while, Annam (northern Vietnam) to the south and

Yunnan in the southwest kept their independence at the cost of being tributaries of the Song.

The Mongols of Khubilai Khan's Yuan dynasty (1271–1368), which extinguished independent Chinese rule in 1279, continued the tribute system, even receiving it from 12 countries stretching from Sumatra to India in the 1280s, but this relationship did not last.

The Ming dynasty (1368–1644) replaced the Mongols and engaged in tributary relations with Korea, Japan, and central, southeast, and south Asia. On the frontiers, the emperors co-opted tribal leaders to keep the peace by confirming their hereditary leadership in return for behavior as tributaries. The Hongwu emperor (r. 1368–1398) organized nearby Mongol units as a defense against more distant Mongols. The Yongle emperor (r. 1402–1424) played off western Mongols and eastern Mongols and effectively organized tribal military units in Manchuria of western Mongols there and the Jurchen farther to the east. The Yongle emperor detached Jurchen tributaries of the Koreans by using Jurchen envoys steeped in Chinese culture.

The Ming constantly had to oversee these relationships as they frequently changed. When the Jurchen switched allegiance to the western Mongols in the 1440s and threatened China's ties to Korea, the Ming successfully regained the Jurchen as tributaries. When Jurchen tributary missions to China became disruptive, the Chinese built a horse market north of the Great Wall for tribute exchange. The Chinese also built fortifications to protect overland Korean tribute missions to China.

The Ming dynasty's reach went to the Hami oasis in modern Xinjiang, through which passed trade and some 38 tribute missions along the Silk Road from Central Asia. Horses and furs from the steppe went to China in exchange for silk cloth, clothing, tea, and manufactures. Although the Ming restricted private individuals from trading with foreigners, officials as well as merchants continued to do so. The dynasty had to prohibit private Chinese commerce in swords. Smuggling was also a problem. Commerce, not stressed as essential, in fact was fundamental to the tribute system.

Relations with Japan were vexing. Japan did not willingly acknowledge Chinese superiority.

➤ WHEN USING BARBARIANS TO CONTROL BARBARIANS FAILS—THE EXAMPLE OF THE JURCHEN

Imperial historians would lament the decision of the Song dynasty to use barbarians to control barbarians, a divide and rule policy of the ancient Han dynasty, in the conflict between two northern barbarian groups, the Jurchen (Ruzhen) and their Liao dynasty overlords. The Song, in alliance with the Jurchen, hoped to recover 16 prefectures below the Great Wall, including the area of present-day Beijing, occupied by the Liao since 936.

The Jurchen Jin (Gold) dynasty (1115–1234) overthrew the Liao in 1125, while the Song attack from the south floundered. The poor performance of their Song ally encouraged the Jurchen to attack the Song capital at Kaifeng in 1126. The Jurchen lifted the siege upon payment of a large ransom. Later in the year the Jurchen resumed the siege, took Kaifeng, and captured the Song court, includ-

ing the emperor and the former emperor. The Northern Song dynasty (960–1126) ended as the Jin occupied the land down to the Huai River and raided beyond the Yangzi River. A Southern Song dynasty (1127–1279) continued to rule in the south from Hangzhou.

At the Southern Song court the militant idealists who wanted to continue the war against the Jin lost out to the realists who bought peace in 1141 with payments of silver and silk. To show its sincerity to the Jin, the Song court also executed Yue Fei, one of its more capable generals in the war against the Jin, who is today a symbol of Chinese patriotism. For the Song, the tribute system remained reversed.

—Henry J. Antkiewicz

However, for commercial purposes, Yoshimitsu, the third Ashikaga shogun (r. 1368–1394), acceded to Chinese protocol as a tributary, much to the delight of the Chinese and the chagrin of other Japanese leaders.

The Ming dynasty pursued stability in the south with the non-Chinese peoples within its borders in much the same way as in the north, by recognizing their status in return for loyalty. Like the Mongols before him, the Hongwu emperor also sent out tributary expeditions by sea. The tributary system reached its height under the Yongle emperor, who sent out great maritime expeditions reaching into the Indian Ocean. The later Ming emperors followed more modest ambitions beyond their borders but always kept an eye on the northern frontier.

Ambassadors of the Venetian Republic

From the High Middle Ages (1000–1300) through the early modern period, Venetian diplomacy maintained a level of international stability in the Mediterranean basin that allowed for economic and political expansion of La Serenissima. In their capacity as representatives of the interests of Venice, diplomatic envoys provided business contacts, peace negotiations, alliances, and intelligence from their respective diplomatic stations, particularly in the Byzantine and Ottoman empires. Venetian diplomacy evolved from the use of legates, modeled on those of the papacy, to that of the office of ambassador, which resided permanently and represented the interests of Venice at foreign courts. As part of the growing usage of diplomacy as a means of reducing the endemic warfare that plagued the Mediterranean, Venetian ambassadors were quite successful in carrying out their duties and contributing to the grandeur of their city.

Through much of the Middle Ages, Venetian foreign affairs were primarily conducted through

➤ BERNARD DU ROSIER ON THE DUTIES OF THE AMBASSADOR

The French cleric Bernard du Rosier (1404–1475) composed the first known textbook in Europe on the duties and roles of the secular diplomatic ambassador. In that work of 1436, known as the *Ambaxiator brevilogus* (*Treatise on Ambassadors*), he wrote:

“The causes of sending ambassadors are as various as the developments which occur: . . . for the glory of the imperial highness; for maintaining the rights of kingdoms; for offering obedience to superiors; for aiding fathers and the fatherlands; for peace and justice; for friendship, for courting good will; for settling wars; for initiating and strengthening truces. . . . for all and singular purposes which tend to the good of the commonwealth of any kingdom, principality, ecclesiastical, or worldly power, of any city, land, place or country, it is praiseworthy to send ambassadors.”

—Abraham O. Mendoza

Donald E. Queller, *The Office of Ambassador in the Middle Ages* (Princeton, NJ: Princeton University Press, 1967), 85.

the offices of the legate (*nuncius*), the procurator (plenipotentiary), and the *baiulo* (consular official, distinguished from the procurator or legate). Medieval conceptions of the role of diplomatic envoys contributed to the evolution of the Venetian diplomat. The Venetian legate, modeled on the papal representatives to foreign courts, had the capacity to relay messages directly from Venice to foreign courts, serving as messengers and able to negotiate treaties and issues regarding affairs between the two states. However, legates were unable to directly represent the state of Venice without first consulting with officials back home for permission to conclude any official business. Procurators, who had the legal authority to directly represent the wishes of the Venetian state, served as direct liaisons of Venice to foreign courts in their capacity as legal representatives. Unlike the legates, procurators did not have to refer back to Venice for permis-

sion. However, procurators typically represented private interests, concerned as they were with commercial and trade issues, and were used only sporadically for direct diplomacy. Given the special trade relationship between Venice and Byzantium, the Venetian *baiulo*, who resided in Constantinople, such as Girolamo Lippomano (1588–1591), served limited diplomatic functions. The office of ambassador and the office of *baiulo* could both be granted to the same individual, as was usually the case for the envoy to Constantinople and Rome.

From approximately the late 1300s to 1500 CE, the Venetian office of the ambassador developed into an amalgam of the roles given to legates, procurators, and *baiuli*. Venetian ambassadors served as direct liaisons of the Venetian state; resided abroad in their host countries, such as Rome, London, Paris, Cairo, and Constantinople; and had full legal authority to carry out business for Venice without having to return home to consult with their superiors. Ambassadors from Venice typically emerged from the patrician class, which included the leading merchant families and had firm control of the city's economic and political institutions. The office of ambassador, which imparted a high degree of prestige that brought honor to the family of the officeholder, was a post to which Venetian patrician sons could aspire. The position of ambassador served as a form of preparation for future endeavors in business and politics in that it gave the officeholder valuable experience in representing the economic and political interests of Venice, which usually were one and the same.

Venetian ambassadors to Constantinople, both in the Byzantine empire and its successor, the Ottoman empire, maintained a pivotal role in ensuring that these eastern Mediterranean states were friendly to Venetian interests, thereby maintaining important economic links with the region. After the fall of Constantinople to the Turks in 1453, Venice shifted its policy to accommodate its relationship with the growing regional power, the Ottomans.

Papal Legates to Eastern Christians

The internationalization of the papacy that resulted from the eleventh-century papal reform movement, along with the establishment of crusader states in the Holy Land, led to increased contact between the papacy and Eastern Christians. Mainly through the intermediary of legates—churchmen empowered to represent the pope—the papacy held talks and negotiations with Eastern Christian bodies. These discussions dealt with political, military, and economic matters but focused above all on the issue of church union. In the papacy's view, church union meant recognition by Eastern Christians of papal primacy and jurisdictional supremacy as well as the acceptance of certain theological doctrines and religious practices that had developed in the West. These included the doctrine of the double procession of the Holy Spirit from the Father and the Son, with the consequent insertion of the *filioque* (and from the Son) clause into the Nicene Creed, and such traditions as using unleavened bread (azymes) for the Holy Eucharist. The papacy particularly desired union because it believed that a united East and West offered the best means for liberating and/or protecting the Holy Land from Muslim forces. By the early thirteenth century, under the influence of millenarian theorists, many popes and Latin churchmen also believed that church union was a necessary step toward ushering in the Final Days and the Last Judgment. In contrast, Eastern Christians often took up negotiations more for political than religious reasons, using the prospect of church union as a means of obtaining Western military aid.

The papacy expended the most effort at church union on the Byzantines, or Greeks, of Constantinople and the various churches of Eastern Europe that had accepted Christianity from Byzantium, such as the Bulgars. Over the centu-

ries, different political circumstances and ecclesiastical traditions had caused the Latin and Greek Churches to drift apart. The reform papacy's first attempt to improve the situation, the 1054 legation of Cardinal Humbert to Constantinople, ended disastrously with the laying down of mutual excommunications. Although historians often date the East-West schism from this event, the episode was not, in fact, of lasting importance, as contact continued almost immediately afterward between the papacy and Byzantium. Of much greater importance was the conflict and misunderstanding occasioned by the First Crusade and the sacking of Constantinople (1204) during the Fourth Crusade. Although Pope Innocent III interpreted the conquest of Constantinople as a miracle, believing that it had brought about by force the long-desired union between the Latin and Greek Churches, in actuality the conquest made the schism even more permanent by ingraining in the Byzantines a deep-seated hatred and distrust of the Latin West.

After the establishment of a Latin empire at Constantinople (1204–1261), the popes maintained cardinal legates there almost continuously until 1226. These legates attempted, with only mixed success, to gain the adherence of the Greek clergy under Latin control to church union; served as judges in the numerous lawsuits that arose concerning ecclesiastical property; and acted as the pope's agents in dealings with the rulers of the Latin empire and with the Latin patriarch of Constantinople. From 1229 until the recapture of Constantinople by the Greeks in 1261, however, popes appointed the Latin Patriarchs of Constantinople as their permanent legates in the region.

Although papal legates—for instance, the Franciscan minister general John of Parma in 1248 and Bishop Constantine of Orvieto in 1256—carried on negotiations with the Greek successor states of the Byzantine empire, serious talks on church union only resumed with the Greek recovery of Constantinople and restoration of the Byzantine empire under Michael VIII Palaeologus in 1261. His efforts, aided particularly by the papal legate John Parastron, led to a proclamation of church union at the Second Council of Lyon in 1274. Michael, however, was ultimately unable to gain the acquiescence of

➤ INNOCENT IV

(Library of Congress)

Sinibaldo dei Fieschi was a skilled canonist and administrator who ascended the papal throne as Innocent IV on June 25, 1243. His commentary on Gregory IX's *Liber Extra* or *Decretals* (the second book of what became the Catholic Church's Corpus of Canon Law) had an enormous influence on the Western legal

tradition. In it he argued that the pope had jurisdiction over non-Christians and could call for a just war against them if they occupied Christian lands or refused to let missionaries preach in their territory. Much of Innocent's pontificate was spent struggling against Emperor Frederick II Hohenstaufen (r. 1212–1250) over control of central Italy. This conflict left its imprint on many aspects of Innocent's pontificate, including the First Council of Lyon (1245). Nevertheless, Innocent also devoted much attention to the East and Eastern Christians. In 1245, for instance, he commissioned four separate embassies to the Mongols, one of which was led by the Franciscan John of Plano Carpini, the author of one of the most important sources from this period, the *History of the Mongols*. And in 1246 Innocent commissioned another Franciscan, Lawrence of Portugal, as papal legate to the whole East. Innocent died in Naples on December 7, 1254.

—John Wei

the Greek Church, and the union was repudiated soon after his death in 1282.

The fourteenth century saw sporadic attempts at union, initiated for the most part by Byzantine emperors increasingly concerned over the Ottoman Turkish menace on their borders. In 1357 the legate Peter Thomas was sent to Constantinople, where he managed to convert John V Palaeologus to the Latin faith, although this did not effect union between the Churches. And during the Turkish siege of Thessalonica (1383–1387),

Emperor Manuel II held talks with another papal legate that resulted in the proclamation of union, which, however, did not outlive the fall of that city to the Turks.

Attempts in the fifteenth century at ending the schism led finally to the Council of Ferrara-Florence (1438–1439), where Emperor John VIII and Patriarch Joseph II accepted papal primacy and the Roman Church's position on all controversial points except for the Byzantine rite, which they were allowed to keep. Although this was the most serious of all attempts at union and produced a small Byzantine rite—the Greek Uniate branch of the Catholic Church—it was repudiated throughout most of the Greek Church. Indeed, almost all of the 33 Byzantine churchmen who had signed the papal bull of union in Florence recanted upon their return home. Following Constantinople's capture by the Ottoman Turks on May 29, 1453, Patriarch Genadius proclaimed that it was deserved punishment for the momentary betrayal of the Orthodox faith at Florence.

Legations to other Eastern Christians had mixed results. Some, such as Innocent IV's appointment of Brother Lawrence of Portugal as legate to the East in 1246, simply brought chaos to Cyprus and produced no tangible results. Others, such as the legations under Pope Innocent III to Kalojan, the tsar of Bulgaria, merely resulted in nominal church union for a few decades. Much less typical were the 1197 legation of Cardinal Conrad of Wittelsbach and other legations to Armenia, which resulted in a union with the Armenian Church that lasted until the conquest of Armenian Cilicia (southern Anatolia) by the Mamluks in 1375. The only lasting success was the union with the Maronites of Lebanon. Scholars favoring the view that the Maronites originally professed Monothelitism, or the doctrine that there is only one will in Christ, often follow William of Tyre (d. 1185) in dating the union to 1180–1181 or place it in 1215, when the Maronite patriarch, Jérémie of Amchite (1199–1230), attended the Fourth Lateran Council. In contrast, defenders of the Maronites' uninterrupted orthodoxy, who tend to be Maronite, usually date the union to shortly after the First Crusade (1095–1099).

Byzantine War and Diplomacy

In Byzantine thought, diplomacy and warfare were a continuum to protect the imperial state as God's earthly kingdom. The emperor's highest duty was always to bring peace to the Christian Roman empire and to bring others into the Christian civilization over which he presided. Defending the empire in war, especially against non-Christian invaders, was considered doing God's will, but war was justified only when diplomacy failed. Strong and well-trained armies were essential and prowess in battle valued, but unlike the Western crusades that promised forgiveness of sins, Byzantine theology never included the belief that warfare against infidels was a religious duty. There were equally pragmatic reasons for the Byzantine preference for diplomacy over battle. The geopolitical setting of the empire, surrounded by actual or potential invaders, meant that there was never enough manpower to defend all borders. A defensive strategy evolved in the early Middle Ages based on the belief, often justified, that Byzantine armies would always be outnumbered by their enemies and the consequent need to minimize the loss of imperial forces. Using institutions and practices inherited from late Rome, Byzantium negotiated treaties, religious conversions, marriages, payments, and even bribes with current and potential enemies. Nevertheless, in reality, emperors spent much of their life on campaign, and military exploits were celebrated.

➤ MANUEL COMNENUS

Manuel I Comnenus (r. 1143–1180) epitomized the use of diplomacy in twelfth-century Byzantium. In his 37-year reign, he used all the tools of diplomacy—marriages, treaties, honors and titles, and much gold—to create complex and ever-changing alliances to preserve Byzantine authority. Manuel's policy focused on the Western European powers, especially the crusader states, the various polities of Italy, the pope, and the German emperor. He married two Latin brides, negotiated Latin marriages for his son and nine Comnenian princesses, and introduced feudal concepts and chivalric tournaments to his court. Manuel's goal was to create indirect ties of vassalage in states surrounding the empire and to reinforce the acknowledgment of Byzantine sovereignty. His conflict with the German emperor Frederick Barbarossa centered on the imperial title (Frederick's insulting use of "king of the Greeks" for Manuel and "Roman Emperor" for himself) and actual political control of Italian city states. To counteract Frederick, Manuel negotiated with Pope Alexander III to resolve theological and disciplinary differences between the Churches. Although the Churches were not reunited (and Manuel's zeal for rapprochement did not extend to submitting the Greek Church to papal overlordship), Manuel was remembered warmly in papal circles as a friend. At the end of his rule, Manuel's Western engagement failed, and he lost a major battle to the Seljuk Turks at Myriokephalon in Anatolia.

Manuel's historical reputation has proved controversial. Some believe that he sowed the seeds of the Latin conquest of 1204, while others argue that his attempts to create indirect power in a multicultural world were the mark of a brilliant ruler.

—Dorothy de F. Abrahamse

Diplomacy revolved around the emperor and the ceremonies that surrounded him. At a time when most rulers in the Latin West had no permanent capital, Constantinople and its monuments and the ancient ceremonial of the palace provoked awe, and until the late empire, embassies that visited Constantinople witnessed the marvels of the imperial throne room, where mechanical lions roared and the throne levitated,

and were invited to vast banquets designed to demonstrate the wealth and power of the emperor. Neighboring states to the north and west, less developed than Byzantium, were encouraged to become part of a so-called family of kings in which the Byzantine emperor, ruler of the civilized universe (*oikoumene*), might adopt a ruler as a spiritual son, or godson, if he converted to orthodox Christianity. Byzantine rulers protected their borders by supporting tribal groups outside the empire with treaties that offered annual payments, titles, and elaborate gifts. Until the eleventh century, Byzantium was surrounded by satellite peoples linked by treaty.

The character of Byzantine diplomacy changed in the eleventh century when neighboring states became aggressive, and organized kingdoms, especially in the West, and Byzantium's emperors found themselves requesting military assistance as brother Christians rather than superior rulers. Thus, Alexius Comnenus used oaths to forge personal bonds with crusade leaders. Throughout the twelfth century, Byzantine emperors increasingly relied on imperial marriages to create alliances, especially with Western rulers, in the hope that the marriage would bring lasting influence within the foreign court and family as well as immediate alliances and the material gifts of dowry. They forged alliances that enmeshed Byzantium, for the first time, in the growing international politics of Europe and the Mediterranean world and sought to preserve Byzantine prestige through symbolic lordship over smaller neighboring states. Even in the thirteenth century the Palaeologan rulers of Byzantium, now a small and poor state, were able to use historic traditions and diplomatic expertise to maneuver for survival against would-be conquerors. The tragedy of Byzantium's last century was reflected in its diplomacy as the descendants of emperors whose capital and courts had awed foreigners now made their way to the West to beg for help.

Byzantine diplomacy depended on well-developed institutions and offices. Embassies were regularly sent to foreign rulers with power to negotiate treaties, often with carefully worded letters and verbal messages of interpretation sealed with oaths and confirmed in a document bearing the imperial signature and seal. Along with

merchants and other travelers, ambassadors collected intelligence about customs, diplomatic strategy, and military practices in reports that were maintained by a high-ranking official in charge of foreign affairs (*Logothete of the Dromos*). Elaborate protocol and official regulation governed the visits of foreign embassies to Constantinople. The symbolic role of Byzantium as the Christian Roman empire could be as important as real power, as reflected in conflicts with the West's Holy Roman emperor and the pope over imperial titles.

To outsiders, Byzantine diplomacy, its rulers' willingness to use money and titles to gain allies and prevent war, and the rhetorical language and ritual that governed Byzantium's foreign relations gave it a reputation for deviousness, guile, and a lack of courage and trustworthiness. But those same traditions and the institutions that were developed to support them allowed the empire to survive simultaneous threats on multiple borders, create a lasting orthodox civilization, and maintain respect and influence for centuries far beyond its actual power.

Zhenghe and Early Ming Diplomacy

The traditional rationale for the voyages to Southeast Asia and the Indian Ocean authorized by the Yongle emperor is that he sought to increase

China's international prestige while reaffirming his own legitimacy in the eyes of China's neighbors near and far and to raise money through tribute trade at a time when the Silk Road across Central Asia was controlled by the armies of Timur-i Leng (Tamerlane), and perhaps because of a desire to find his predecessor, whom he had deposed and probably killed but who was rumored to be living abroad. Much is made in the popular media of the peaceful intention of the voyages, but when examined in such detail as the sources allow and in the context of other contemporary foreign policy initiatives, the voyages more closely resemble explicit efforts to assert Chinese hegemony overseas in what one historian has likened to a form of gunboat diplomacy.

In the late fourteenth and early fifteenth centuries China annexed Yunnan, on the border with Burma (Myanmar) and now an integral part of China, and Dai Viet (northern Vietnam), which was ruled as a province from 1407 to 1428. Ming records claim that the latter cost the lives of seven million Vietnamese, which, while exaggerated, confirms the violent nature of Chinese expansion. Zheng He's missions were accompanied by tens of thousands of soldiers who were deployed on at least three occasions. On Sumatra, Palembang was already home to many Chinese expatriates, one of whom, declared a pirate by Zheng He, was captured and executed in 1407. Subsequently, the Chinese installed a ruler in Palembang, which they viewed not as an independent country but as a "pacification superintendency," a term normally reserved for semiautonomous territories along the Chinese border.

The same year, the Chinese demanded reparations for nearly 200 soldiers killed on Java and warned that "What happened in Annam [Vietnam] can serve as an example" if the ruler of Majapahit failed to comply. Four years later, Zheng He captured a Ceylonese king and brought him and his family to China, where he was pardoned for being "insulting and disrespectful" in refusing to recognize the emperor as his overlord. In the meantime, Zheng He had appointed a Ming puppet to rule in his stead. Although the Chinese generally exercised influence in Burma via the southwestern land route through Yunnan, in

➤ ZHENG HE IN YEMEN

While the most enduring influence of the Zheng He expeditions was felt in Southeast Asia, the *Chronicle of the Rasulid Dynasty* of Yemen mentions the visit of a Chinese emissary to Aden during the fifth expedition (1417–1419), during which lavish gifts were exchanged between "the Lord of China" and "our Lord the sultan al-Malik al-Nasir." The sultan received "a splendid present consisting of all manner of rarities, splendid Chinese silk cloth woven with gold, top quality musk, storax [an aromatic], and many kinds of china-ware vessels." A sixteenth-century Yemeni historian adds that the emissary

"had an audience with al-Malik al-Nasir without kissing the ground in front of him, and said: 'Your Master the Lord of China greets you and counsels you to act justly to your subjects.' And [the Sultan] said to him: 'Marhaban [welcome], and how nice of you to come!' And he entertained him and settled him in the guesthouse. Then al-Nasir wrote a letter to the Lord of China: 'Yours it is to command and [my] country is your country.' He dispatched to him wild animals and splendid sultan robes, an abundant quantity, and ordered [the envoy] to be escorted to the city of Aden."

Chronicle of the Rasulid Dynasty, quoted in R. B. Serjeant, "Yemeni Merchants and Trade in Yemen, 13th–16th Centuries," in *Society and Trade in South Arabia*, edited by G. Rex Smith (Aldershot, UK: Ashgate, 1996), 74–75.

1409—at the start of the same expedition that saw the arrest of the Ceylonese ruler—the emperor threatened to invade a local ruler's lands using forces coming "from the ocean route."

One of Zheng He's mandates was to instruct foreign rulers to send "tribute" missions to the Ming capital at Nanjing, and the Chinese established hostels to house the envoys who accompanied these in the southern provinces. The unprecedented numbers of ships and men commanded by Zheng He sufficed to persuade most rulers to accede to this request, if only so they could benefit from the emperor's tributary system,

which was then the only legal form of overseas trade with China. These demonstrations of Chinese superiority, if not invincibility, also compelled a number of Asian rulers to visit China themselves at a time when rulers seldom left their realms for diplomatic visits. According to one account of the voyages, 30 states, including Egypt and Mecca, sent ambassadors to the Ming emperor.

Coercive though Zheng He's treasure fleets might have been, they had positive effects as well, especially in securing the future of the strategically situated port of Melaka (Malacca). Founded just before the start of Zheng He's voyages, by the voyages' conclusion the city's population was more than 100,000. Six centuries later Malayan Chinese continue to revere Zheng He, and incense burns in his memory at the Sam Poh Kong Temple in Melaka to this day.

Zheng He and Early Ming Diplomacy—A Second View

Ma He (1371–1433), a Muslim from Yunnan Province in China's southwest, was made into a eunuch in 1385 and given to imperial prince Zhu Di, Prince of Yan, whose seat was Beijing (North-

ern Peace), the future Beijing (Northern Capital). The prince later awarded Ma He the titular name Zheng He for his faithful service. In 1402, Zhu Di usurped the throne, becoming the Yongle emperor (r. 1402–1424). In 1403, the Yongle emperor ordered Zheng He to oversee the construction of a fleet at the Ming capital of Nanjing, which he then commanded as it sailed from the coast of Fujian.

Zheng He's seven treasure-ship fleets, the largest naval expeditions to that time (1405–1433), sought the acknowledgment of Chinese supremacy far into the Western Sea, that is, beyond Southeast Asia to India, the Middle East, and the coast of East Africa. Palace eunuchs led the soldier-filled fleets and, on behalf of the emperor, invested rulers with titles, fought when necessary, and conveyed emissaries to China and back to exchange gestures of tribute for valuable presents. The treasure fleets kept vital sea-lanes open to traffic and conducted considerable trade, which benefited the imperial household since it barred private Chinese merchants from these transactions.

The Yongle emperor's public reasons for the expeditions were to end rumors that the predecessor whom he had overthrown, the Jianwen emperor, had not perished and had fled abroad and also to parry threats from Central Asia, such as the one by Timur-i Leng (Tamerlane), who died in 1405 while preparing an invasion of China. A less public reason for the expeditions was the Yongle emperor's need to gain respect for his imperial status. Hence, he ordered these fleets to proclaim his and the Ming dynasty's imperial stature, both at home and abroad, by recourse to the traditional Chinese tribute system.

The first fleet in 1405 had over 300 ships of various sizes, with a crew of just under 28,000. Sixty-two of the largest vessels, the 12-masted bargelike treasure ships, were possibly 444 feet (135 meters) long, about one and a half American football fields long or five times longer than Columbus's *Santa Maria*. The fleet reached the great emporium of Calicut on the Malabar Coast in southwestern India, destroyed the threat to shipping by Chinese pirates in the Malacca Strait, and returned with ambassadors and tribute. The diplomatic success of this mission inspired fur-

ther expeditions. Subsequent expeditions were more or less the same size but sometimes split up to take side trips.

On the second trip, 1407–1409, the Chinese invested in office the new king of Calicut and left an inscribed memorial stone celebrating the occasion. The king of Brunei on Borneo returned with the fleet to China to thank the emperor for protecting Brunei from Java. The king unfortunately died during the visit. During the third expedition, 1409–1411, the fleet protected its tributary, Malacca, on the strategic Strait of Malacca, from Siam. In Ceylon (Sri Lanka), Zheng He intervened in a struggle for the throne that included the disposition of a Buddha-tooth relic. Zheng He shipped both claimants to Nanjing for judgment.

The first three fleets reached Calicut. The next fleets went farther west. The fourth trip, in 1413–1415, reached Hormuz at the mouth of the Persian Gulf and returned with tribute missions, including some from the coast of Africa. The fifth fleet, 1417–1419, reached Aden near the entrance to the Red Sea, Mogadishu on the coast of Somalia, and perhaps Malindi on the coast of Kenya.

The sixth voyage, 1421–1422, again reached the Somali coast of Africa. This was the last of the treasure-ship expeditions of the Yongle emperor's reign, which were curtailed because of budgetary problems, expeditions against the Mongols, the war in Vietnam, and the building of the new capital complex in Beijing, the new capital. Upon the Yongle emperor's death, the Hongxi emperor (r. 1424–1425) ended the treasure-ship excursions. The Xuande emperor (r. 1425–1435) ordered Zheng He on a seventh trip (1431–1433) because tribute had ceased from the Western Sea countries. Zheng He probably died in 1433 on this final voyage of the treasure ships.

The Ming court thought that giraffes, sent to the emperor as tribute in 1414 and 1416, were actually *qilin*, a mythological animal regarded as auspicious, and these animals were a sign that acknowledged the beneficial spread of Chinese influence to the Western Sea. However, the Chinese would never repeat the diplomatic efforts of Zheng He's expeditions. In 1498, some 80 years later, it was the Portuguese Vasco da Gama, who sailed to Calicut from Malindi, aided by a local

pilot, to alter once again the direction of history on the seas in Asia.

Mexica Diplomacy

In 1426 the Aztec Triple Alliance, representing the combined might of the city-states Tenochtitlan-Tlatelolco, Texcoco, and Tlacopan, smashed the Tepanec empire, seated at Atzacapotzalco, and seized hegemony for themselves. Next they embarked on an ambitious imperialist project that would lead them to dominate Mesoamerican affairs until the Spanish Conquest (1519–1521). During this 100-year period, the Mexica (often referred to as the Aztecs), the tribe who resided in Tenochtitlan, led the alliance and shaped a new empire. And their ruler-commanders, or *huey tlatoque*, concentrated all powers in their own hands, becoming in effect absolute monarchs between the Tepanec War and the Spanish conquistadores' arrival.

Early Aztec conquests took and secured vast tracts of *chinampa* and other prime agricultural lands as well as strategic trade routes. Tenochtitlan, the capital, conscripted troops and laborers and demanded foodstuffs and other basic goods from those it conquered. It also exacted tribute, including gold and silver, jade, exotic animal pelts and feathers, cacao, and other precious commodities. By the time Spaniards such as Hernán Cortés and Bernal Díaz entered the Valley of Mexico and recorded what they saw, Aztec elites had amassed vast stores of wealth and landholdings.

Tenochtitlan's armies achieved this by force. But the Aztecs did not defeat all their opponents. They suffered defeats against the Tarascan city-state and also at Metztlán in the late fifteenth century. And Tlaxcala never capitulated. The Aztecs reached accommodation with others. Under

➤ MOTECUHZOMA II'S EMISSARIES TO CORTÉS

Tenochtitlan's last independent ruler-commander, Motecuhzoma II (r. 1502–1520), sent five high-ranking emissaries to Hernán Cortés when he arrived at the coast in 1519. According to Cortés, they offered submission, showered him with gold and other gifts, and sought to clarify how much tribute Spain would require the Aztecs to pay. Motecuhzoma only asked that for political reasons, the Spaniards should not enter the Valley of Mexico.

Bernardino de Sahagún's *Florentine Codex*, an Aztec account, tells a different story. According to Sahagún's informants, Motecuhzoma and his astrologers had witnessed omens foretelling calamity years before the Spaniards arrived. Then when Cortés landed, Motecuhzoma mistook him for Topiltzin Quetzalcoatl, the mythical Toltec lord and deity who had presumably returned home to reclaim his dominions. Motecuhzoma's emissaries delivered Topiltzin Quetzalcoatl's accoutrements to Cortés. But Cortés seized and shackled these men. Then he fired his cannon as a show of force. This terrified the emissaries and in turn demoralized a now-despondent, virtually paralyzed Motecuhzoma.

Did the Aztecs truly take the Spaniards for gods? Why did Motecuhzoma not move to annihilate Cortés's small force before it entered Tenochtitlan? This cross-cultural encounter between previously unknown peoples and cultures replayed elsewhere as Western Europeans colonized much

Conquistadores Encounter an Indigenous Delegation, from the *Florentine Codex*, by the Franciscan friar Bernardino de Sahagún, sixteenth century. (Art Resource, NY)

of the globe after 1500. And such questions remain vigorously debated in world history.

—James Douglas Lockhart

Motecuhzoma I (r. 1440–1469) and his adviser Tlacaelel, for example, Tenochtitlan waged quasi wars, known as Flower Wars, against Huexotzingo to take captives and then ritually sacrifice them to the war god Huitzilopochtli.

These exceptions notwithstanding, Aztec military power remained unrivalled throughout Mesoamerica. Later ruler-commanders such as Ahuizotl (r. 1486–1502) asserted Aztec sovereignty as far north as modern-day Michoacán and as far south as the Tehuantepec Isthmus. Mexican diplomacy followed an identifiable pattern, such as at Coixtlahuaca in the late 1450s. There Tenochtitlan claimed its merchants had suffered attack and, seizing on this pretext, dispatched emissaries who demanded redress. Then it de-

clared and waged war. Tenochtitlan's conquest and tributary system proved unstable, however. Its armies returned to the provinces again and again to suppress periodic rebellions. The Aztecs, then, required more than mere military superiority and the threat of punitive campaigns to maintain such a far-reaching multiethnic empire. And they understood this.

To legitimate their power, the Aztecs rewrote history, suppressing others' traditions and emphasizing their alleged Toltec descent. They also created an imperial administration, and their diplomatic efforts included efforts at alliance building in the provinces. Tenochtitlan often allowed local rulers to remain in place, provided tribute flowed uninterrupted to the Aztec capi-

tal. The Aztecs sometimes installed client rulers or arranged political marriages to bind local elites to their rule. They also created an imperial legal code to control provincial judges and the peoples and cultures over whom they presided at the grassroots level.

The Aztecs supervised large central marketplaces at Tlatelolco and elsewhere. These markets partly depended on a long-distance trading class called the *pochteca*. The *pochteca* traveled well beyond Tenochtitlan's sphere of influence. One specialized division of these hereditary merchants, the *naualoztomeca*, quietly adopted local customs and dress in order to discreetly gather intelligence for Tenochtitlan. Mexica foreign policy and its various devices, then, all aimed to facilitate military conquest and also to enforce tribute collection from the provinces, thereby enhancing Aztec power.

Incan Diplomacy

From Pachacuti Inca's reign (ca. 1438–ca. 1471) until Francisco Pizarro seized the ruler Atahualpa at Cajamarca (1532), Incan diplomacy pursued imperial aims. It sought to expand Cuzco's reach from the Andes and coastal Peru to the Amazon Basin, conceived and implemented strategies to pacify the large multiethnic population of the Andes, and designed policies to peaceably extract tribute and *mita* labor drafts for military, administrative, and large-scale, state-directed construction projects. Like most great empires in world history, the Incan state, or, as the Incas themselves referred to it, Tahuantinsuyo, intended

➤ PEDRO DE CIEZA DE LEÓN

Much of what we know about Incan history derives from the Spanish conquistadores who recorded what they saw and heard and not from the Incas themselves, who lacked writing. Perhaps the most important of these Spaniards was Pedro de Cieza de León. Cieza traveled throughout Peru in the mid-sixteenth century and, aided by translators, interviewed local informants who were probably one or more factions of Incan elites. After Cieza returned to Spain he wrote *Crónica del Perú*. It was eventually published in four parts.

We remain concerned whether early colonial documents like Cieza's *Crónica* recorded history or just myth or merely the impressions of writers who lacked the ethnographic training they would have required to observe, record, and interpret the native voice. Moreover, whether writers like Cieza faithfully and accurately represented Andean traditions or unconsciously superimposed a Hispanic sense of historicity onto what some believe was an ahistorical culture remains vigorously debated.

Ethnohistorian Catherine Julien has proposed a nuanced reading of Cieza and the other chroniclers' accounts. She advocates "excavating" these texts and corroborating whatever facts might be extracted from this sensitive process with those derived from the archaeological record, thus rescuing the native voice through an interdisciplinary all-source methodology. Julien premises this proposal on her belief that Incan history is indeed encoded in Cieza and the others' narratives and that we can recover it.

—James Douglas Lockhart

to assert and consolidate its sovereignty and political economy as far and wide as possible.

Pachacuti and his successors employed several devices to meet these ends. Many of these, such as mummification, ancestor worship, and a solar-oriented theocracy, had pre-Incaic origins. Incan rulers also used political marriage, alliance, and negotiation and, when necessary, intrigue, intimidation, and military force to accomplish these goals. Pachacuti, for example, dispatched an army to explore Peru's southern coastline in the mid-fifteenth century. This Incan force operated jointly with another force from a neighboring

kingdom, Chanca. When the opportunity presented itself, however, Pachacuti ordered his commanders to assassinate the Chancan commanders, thus moving to decapitate and subordinate a rival in what became the war that launched large-scale Incan expansion.

As Cuzco incorporated diverse kingdoms, peoples, cultures, and new lands, its officials expended great effort to preserve and co-opt the so-called *curaca* classes, or the local hereditary nobility, to facilitate Incan administration. Cuzco offered curacas Inca-by-privilege status. The Incas sometimes even attempted to destroy inconvenient local governments, creating curacas where there had been none before. Some refused and resisted assimilation. In most cases, whether the curacas accepted cooptation or not, the Incas took and virtually held their sons hostage. Once in Cuzco these children learned Quechua, the imperial language, and other Incan customs. When these children returned home, they took their place in Incan society as loyal administrators.

Cuzco also resorted to forced resettlement by incorporating the preexisting *mitmaq* institution. This affected individuals, families, and, in some cases, entire communities. As might be expected, these colonists were sometimes rebels whom the state relocated for security purposes. Sometimes they were loyal subjects whom Cuzco dispatched to dissident communities to discreetly surveil suspected troublemakers. The *mitmaq* could also remove potential rivals from the emperor's own family, sending them away from Cuzco. Some resettled volun-

tarily, as was customary in the Andes. Scouts, garrisons, agricultural specialists, and others were called to serve the state in faraway posts. In each case, however, an assertive Cuzco intervened in community life to further imperial statist projects.

Scholars continue to discuss just how successful Cuzco was in achieving these objectives. It is clear, however, that by the time the Spanish conquistadores arrived at Cajamarca, Pachacuti and his successors Topa Inca (r. 1471–1493) and Huyana Capac (r. 1493–1525) had expanded Tawantinsuyu's borders to include present-day coastal Peru and most of Ecuador to the Colombian border and as far south as central Chile. A vast system of sophisticated roads facilitated rapid communication and transportation from one end of the empire to the other. The Incas had also penetrated the Amazon Basin, east of the Andes, although they never pacified the peoples and cultures living there.

■ Introduction: An Era of Large-Scale Conflicts

War on all scales of combat has been a constant and unhappy fact of human life since at least the rise of Neolithic settlements, but the period 1000–1500 seems to have been an especially bloody one, particularly in Afro-Eurasia. This great expanse of land and seas witnessed almost five full centuries of struggles between Byzantines and Turks, an equally long period of crusading that then spilled over

into the sixteenth century, the thirteenth-century Mongol conquests, Japan's twelfth-century Gempei War and its successful but costly repulse of two massive Mongol invasions in the thirteenth century, Western Europe's Hundred Years' War, the campaigns of Timur-i Leng (Tamerlane), and Chinese counterattacks against the Mongols during the Ming era. This list does not exhaust the catalogue of major wars in Afro-Eurasia during

this half millennium that cumulatively killed and maimed tens of millions of human beings, most of them noncombatants or unwilling participants in these wars, and wasted countless cities, towns, and countrysides. Some of the devastated settlements and areas took generations to recover. As the ruins that still are visible today in regions such as Central Asia bear witness, some never recovered.

Given so many conflicts when war must have seemed a natural human activity, it is not surprising to find even a few mythic wars, military campaigns that never took place but entered into popular lore and even modern historiography. Such a mythic nonexistent war is the supposed Almoravid invasion and conquest of Ghana in 1076. Myth is not needed, however, to validate the fact that for Afro-Eurasia this was an era of bloodshed on a major scale.

In the Americas, wars were an integral part of the many “courage cultures” that were to be found throughout the length and breadth of the hemisphere, although the ethos of the warrior did not infuse the culture of absolutely every society in the pre-Conquest Americas. Despite this widespread warrior culture, conflicts in the Americas tended to be more localized and of smaller scale, with two notable exceptions: the Aztec subjugation of much of central Mexico and, far more significant, the campaigns and conquests that established the Inca empire.

Were this topic to include all of the major conflicts that plagued this era and their many interesting and important facets, it would fill a volume by itself. Let these entries and sidebars and the many entries that appear under other topical headings in this section of this volume suffice to present a glimpse, no matter how incomplete, of this age of major conflicts.

The Seljuk Turks and Byzantium— A Byzantine Perspective

The Seljuk migration into the Middle East in the mid-eleventh century initiated major demographic change in the Mediterranean world, as core Byzantine territory in Anatolia became the home of Islamic Turkish tribes. The initial invaders were nomadic Turkmen followers of Seljuk

> ALEXIUS COMNENUS

Alexius I Comnenus (r. 1081–1118) inaugurated the last great period of Byzantine preeminence. He restored Byzantine prestige by stabilizing its currency, strengthening family power, and conducting constant campaigns against and alliances with surrounding powers. The Comnenian dynasty expanded its power through marriage alliances with aristocratic families, negotiations in which Alexius’s mother was often central. The system that Alexius created engaged Byzantium deeply with emerging neighboring states. Best known in the West for his encounter with the crusaders, Alexius is vividly portrayed in contemporary sources. Most First Crusade chroniclers described him as devious and arrogant, but to his daughter, Anna, Alexius was a hero. Her early-twelfth-century laudatory biography of her father, the *Alexiad*, written in classical historical style, is one of the greatest extant Byzantine literary sources. It brings Alexius, his campaigns, the leaders of the time, and the challenges to the Comneni to life from his daughter’s unique but biased viewpoint.

—*Dorothy de F. Abrahamse*

rulers who conducted raids along the Byzantine frontiers. As border defenses were neglected in the third quarter of the eleventh century (1054–1071), incursions increased, and in 1071 Emperor Romanus IV Diogenes (r. 1068–1071) engaged the Seljuk Sultan Alp Arslan in a battle at Manzikert in eastern Anatolia that resulted in a Byzantine defeat and his own capture.

During the civil war that followed, Turkmen in search of plunder and pasture for their flocks poured into Anatolia, where they settled. Anatolia was now divided into Byzantine and Seljuk spheres of authority. The resultant struggle for control of the entire peninsula lasted for more than a century and was marked by major battles, ongoing raids, and the growth of several independent Turkish states. Seljuk rulers developed highly organized polities in their attempt to control the nomadic Turkmen, who continued to transform much of Anatolia from an urban and agrarian to a nomadic economy of raiding and pastoralism.

The Seljuk ruler of Nicaea, located in northwestern Anatolia near Constantinople, took the title of sultan and called his kingdom Rum, the Turkish term for Rome. It expanded to include much of Byzantine territory in southern Anatolia and Syria, including Antioch. When Emperor Alexius I Comnenus (r. 1081–1118) made an appeal for Western warriors that resulted in the First Crusade, his aim was to recover Byzantine control of Anatolia. The crusader siege of Nicaea resulted in the return of western Anatolia to Byzantium, but other crusader conquests became Latin kingdoms, and the Seljuk rulers of Rum moved their capital to Iconium (present-day Konya) in southeastern Anatolia. Alexius's successors John II (r. 1118–1143) and Manuel I Comnenus (r. 1143–1180) stabilized Byzantine borders against the Turks through energetic campaigning and successful diplomacy but did not restore significant territory. In 1180 Manuel Comnenus attempted a major attack on the Seljuk capital of Iconium, but his army was defeated at Myrioccephalon. It was not this battle but the empire's subsequent disintegration that opened Byzantine territory to Turkmen raids once again. A final period of recovery for both Greeks and Seljuks took place during the Latin rule in Constantinople when the Greek rulers of Nicaea (1211–1261) created a prosperous state and a stable peace with the Seljuk sultans in Iconium.

Byzantine relations with the Seljuks were governed by pragmatism rather than ideology. They combined warfare with the use of diplomacy and peaceful interactions, as with other neighboring peoples. Alexius Comnenus and his successors made successful alliances with the Seljuk rulers against rival Turkish powers, and Manuel I Comnenus even adopted by treaty the Seljuk sultan Kiliç Arslan as a son. Byzantine and Seljuk aristocrats lived in exile in each other's courts, and the Byzantine imperial service included Turks who held high offices. They were expected to be baptized as Christians, but no other obstacles hindered their success. Turkish troops fought in Byzantine wars as mercenaries, and Turkish captives were resettled on Byzantine land, where they formed a part of the increasingly multiethnic fabric of the empire.

The Jerusalem Crusades, 1096–1272

On November 27, 1095, while preaching the First Crusade (1096–1099 or 1102) at the Council of Clermont against Muslim powers in the Holy Land, Pope Urban II opened to Europe's masses "a new way into salvation," as Guibert of Nogent put it. This papal appeal received an overwhelming response, and the next year a great multitude of crusaders from northern France, Flanders, Norman Italy, and Provence set forth toward the East.

The march through the Byzantine empire and Turkish Anatolia was long and exhaustive. Many died or were left behind. The crusaders were, however, strongly motivated and uncompromising in their zeal to liberate Jerusalem and the Holy Land. In the summer of 1098 the city of Antioch fell to the crusaders, and a year later, July 15, 1099, the expedition culminated in the capture of Jerusalem. The city was plundered, and surviving Muslim inhabitants were expelled from it.

After fulfilling their crusading vow and visiting the holy places of Syria-Palestine, the major part of the surviving crusaders returned home. A minority stayed behind to defend the newly founded crusader states. For the following two centuries, these Latin states in the East were in constant need of manpower and material support from the West. The lack of manpower to defend the crusader kingdom was a major problem especially before the founding of the military orders in the twelfth century, and a new expedi-

tion was organized in 1100 in order to strengthen Frankish power in this region of the Levant.

The main armies of Lombard—French, Burgundian, and German crusaders of this expedition, known variously as the Crusade of 1101 and as the third wave of the First Crusade—were defeated by Seljuk Turks at the Battle of Mersivan in August 1101, and the separate military forces from France and Bavaria were ambushed by the Turks near Heraclea during their march through Asia Minor. The few survivors continued on to Jerusalem.

Over the next two centuries a series of crusades large and small followed upon the successes and failures of the First Crusade, as men and women of every class and from all regions of Europe, from even as far away as Iceland and Greenland, swore sacred vows to travel to the East in defense of the Holy Land. Crusaders probably headed to Outremer (the land across the sea) yearly. Modern historical tradition, however, has bestowed numbers on only seven or eight of these crusades, depending on who is doing the counting.

On Christmas Eve of 1144 Zengi, Muslim ruler of Aleppo and Mosul, captured Edessa, capital of the Frankish county of Edessa. When the news reached Europe, Louis VII of France took the cross as the first European crusader-king. In Germany, papal legate Bernard of Clairvaux preached the crusade to Emperor Conrad III, who decided to join the expedition as well.

The German crusaders who left Europe in May 1147 were severely hit by a flash flood during the march toward Constantinople, and the Turks demolished the main force, which had split into two, only a few days after crossing the Bosphorus. Survivors joined the French, who were following them. While passing the Cadmus Mountains in Anatolia, the combined crusader army was not able to keep formation in difficult terrain, and again the Turks attacked, causing the army great losses. When the survivors finally reached Frankish Antioch, a bitter feud flared up between King Louis and Raymond, count of Antioch, who was supported by his niece Eleanor of Aquitaine, Louis's queen, thereby putting a strain on a royal marriage that was dissolved following their return to Europe.

In July 1148 the crusaders finally reached Syria, where they took part in the siege of Damascus. Due to a tactical blunder, the army was cut off from its water supply and was compelled to withdraw. With the collapse of the siege, the Second Crusade (1147–1149) ended in failure. Despite high expectations, the main accomplishment was the capture of Lisbon and Almeria in 1147 by crusaders making a halt on their way east to take part in the Iberian Reconquista.

Disappointment over these meager results and great losses precipitated a surge of criticism toward crusading. William of Tyre, a chronicler of the late twelfth century, describes the atmosphere in Europe: "Kings and princes . . . had been forced to return, covered with shame and disgrace. Nor were they alone affected. . . . [H]enceforth those who undertook the pilgrimages [to the East] were fewer and less fervent."

On July 4, 1187, Saladin, sultan of Egypt, Damascus, and Aleppo, destroyed a major Frankish army at Hattin and in the weeks following conquered most of the lands, cities, and castles held by the Latins in Outremer. On October 2 Jerusalem itself capitulated to Saladin. Almost as soon as the shocking news reached Europe, arrangements began for a rescue operation. The Third Crusade (1189–1192) was led by several of Europe's most important monarchs: Philip II Augustus of France, Richard I Lionheart of England, and Frederick I Barbarossa, Holy Roman emperor of Germany.

Emperor Frederick marched out from Regensburg in May 1189 with an enormous army. Unlike Philip and Richard who had decided to sail to the Holy Land, Barbarossa preferred the traditional land route through Hungary and Byzantine lands. His crusade came to an end when the elderly emperor drowned in the River Saleph (Calycadnus) on June 10, 1190. Many of his crusaders turned back, and the remaining army, under the command of his son, Duke Frederick of Swabia, entered the Holy Land exhausted by battles and march. After the death of the duke in January 1191, the last German crusaders set sail home.

Meanwhile, Philip II and Richard Lionheart had set forth from Vézelay. During an eventful journey east, Richard sacked Messina and conquered Cyprus from its Byzantine usurper-ruler

Isaac Comnenus, thus initiating Latin rule over the island for almost four centuries. After reaching Palestine in the spring of 1191 (April 20 and June 8, respectively), Philip and Richard joined the siege of Acre, which capitulated in July. Soon thereafter Philip returned home, while Richard continued his campaign. Eventually troubles back home (largely Philip's attempts to conquer Richard's feudal holdings in France) and insufficient forces in the Holy Land forced the English king to enter into a treaty with Saladin in September 1192, a treaty negotiated and sealed by their representatives (the crusade's two most famous princes never met). The treaty recognized the Christians' hold of the coastal strip between Tyre and Jaffa, most of which had been wrested away from Saladin's control, but the main target of the expedition, Jerusalem, remained in Muslim hands. Christian pilgrims, however, were allowed free passage to the city.

The Fourth Crusade (1202–1204), summoned by Pope Innocent III and consisting largely of French, Venetians, northern Italians, and Germans, was aimed at liberating Jerusalem by first destroying the power of the Ayyubid sultan of Egypt (Saladin's brother and successor, al-Adil) by capturing the port city of Alexandria and marching on Cairo. The main body of the crusade force never got any farther than Constantinople. Due to an unforeseen concatenation of events, the crusaders wound up capturing the Byzantine imperial city in April 1204 and establishing the Latin empire of Constantinople (1204–1261). Smaller bands of crusaders did make their way to Syria-Palestine, where they helped stabilize and expand the truncated kingdom of Jerusalem, with its capital at Acre.

Likewise, the Fifth Crusade (1217–1221) was directed toward Egypt; in this case the port city of Damietta in Egypt was its initial target. Once again, the idea was to neutralize the Ayyubid sultan's base of power and then to march to Jerusalem. The enthusiasm toward crusading was, however, fading among the European nobility, and finding a unanimously acceptable leader for the expedition proved to be impossible. Thus, the siege of Damietta was conducted by the papal legate Pelagius, a man thoroughly inexperienced in military matters, and John of Brienne, the king of Jerusalem.

In August 1219 St. Francis of Assisi arrived in order to try to convert Sultan al-Kamil, al-Adil's son and successor. At that point the siege had lasted more than a year, and the king and legate were openly quarreling. Brother Francis set out to the Muslim camp, where he was received in courtly fashion by Sultan al-Kamil, himself a patron of Sufi holy men, and was even allowed to preach (but to no avail). The saint departed the sultan's camp on friendly terms, but the military situation remained unaltered.

Eventually crusaders were able to capture Damietta in November 1219 without resistance from the city's inhabitants, who were seriously weakened by famine and disease. The crusaders delayed in Damietta until June 1221 waiting for reinforcements from Europe. Sultan al-Kamil even offered Jerusalem back three times in exchange for Damietta, but the offer was repeatedly rejected by Legate Pelagius against the will of the other leaders. Finally, a disastrous attack was launched against the Muslim forces encamped at Mansurah. Crusaders, cut off by the rising waters of the Nile and enemy forces, were compelled to ask for a truce, and the hostilities were ended with an exchange of prisoners and the restoration of Damietta to the sultan. Al-Kamil, noted for his diplomacy and generosity of spirit, treated the defeated crusaders well, even supplying them with food and allowing them to retire from Egypt unhampered. Nevertheless, the failure was bitter, especially when the crusaders had earlier been offered Jerusalem. In his reproach, William the Cleric writes that clerks should leave fighting to knights and instead concentrate on reciting the Scripture and Psalms.

Jerusalem was recovered, for a short while, by Emperor Frederick II in 1229 during what some call the Sixth Crusade (1227–1229). Ironically, it was accomplished largely through diplomatic and not military means and by a crusader who lay under the ban of excommunication. Frederick's crusade vow, initially sworn in 1215, had outlived two popes, and Gregory IX finally excommunicated the emperor in 1227 for his long delay. Despite that ban, Frederick insisted on embarking for the Holy Land, in large part because his marriage in 1225 to Isabelle of Brienne, heiress of the kingdom of Jerusalem, gave him a claim to that kingdom. In May 1228 he set

► THE CONQUESTS OF JERUSALEM, 1099, 1187, AND 1244

After years spent on armed pilgrimage, Frankish crusaders captured Jerusalem on July 15, 1099. Western sources, quoting the Scriptures, stress the totality of the killing that ensued. Raymond of Aguilers reports, with obvious exaggeration, that in the Temple of Solomon (al-Aqsa mosque), infidels were slaughtered until the floods of blood reached the horses' bridle reins. Crying with joy, crusaders entered the Church of the Holy Sepulcher, the legendary place of the burial and resurrection of Christ, and the *umbilicus mundi*, the navel of the world, for medieval Christians. The city was pillaged, and its surviving Muslim and Jewish inhabitants were expelled.

On July 4, 1187, the allied forces of the kingdom of Jerusalem, the county of Tripoli, the two major military orders (Templars and Hospitalers), and various recently arrived crusaders were crushed by Saladin at the Battle of the Horns of Hattin near Tiberias. In the aftermath of the battle, the Franks lost the relic of the True Cross, and King Guy of Lusignan and many nobles were taken captive. After Hattin, Saladin marched toward Jerusalem. The defense of the city was led by Balian II of Ibelin, the native-born lord of Nablus and one of the few nobles who had been able to escape from Hattin. The defenders fought bravely, but there were too few of them. To avoid massacre and enslavement of the survivors, the Frankish leaders decided to plead for safe conduct in return for surrender. Saladin refused, citing the conquest of 1099 and claiming that Muslims would deal with crusaders just as crusaders had dealt with the population of Jerusalem in 1099. Balian responded by threatening to kill women and children, burn the city, desecrate Muslim holy places, and slaughter all Muslim prisoners held in the city. In response, Saladin granted the Franks an assurance of safe conduct against ransom. Queen Sibylla of Jerusalem and some other noble ladies were exempted from payment. Despite Balian's best attempts to raise the required money to redeem all of Jerusalem's Latin Christians and the generous release of several thousand Franks without ransom by

Illuminated manuscript depicting the capture of Jerusalem in 1099 during the First Crusade. (Library of Congress)

Saladin and his brother al-Adil, a number of the city's poorest—anywhere from 11,000 to 16,000—were enslaved.

Jerusalem was returned to Latin Christian control by the treaty of 1229 between al-Kamil and Frederick II. Jerusalem was recaptured by the Muslim lord of Transjordan in 1239, but a temporary alliance with the sultan of Egypt allowed the Franks to reoccupy the city in 1241. In 1244 Khorezmian bands in the service of the sultan of Egypt stormed the city. After the surrender of the citadel, the Franks left Jerusalem for good. During the march out, the citizens saw Frankish flags waving from the towers, and the majority of fighting men turned back assuming that a rescue force had arrived. As soon as they got inside the walls, they were ambushed and killed by Khorezmians. Those who had continued the march endured harassment all the way to Jaffa. Only a couple hundred survived.

—Sini Kangas

sail with a small army consisting mainly of German and Sicilian crusaders. Despite the size of his force, the situation was favorable due to dynastic problems that confronted Sultan al-Kamil. Negotiations between the emperor and the sultan ended in a treaty in February 1229 that returned Jerusalem, Bethlehem, and Nazareth to Christian rule and secured a truce for ten years that allowed freedom of worship in Jerusalem to both Christians and Muslims. The treaty was criticized by Christians and Muslims alike as a betrayal of religion. In Italy, Pope Gregory IX gave an order to attack imperial lands in Apulia, an attack that ended disastrously for the papal forces.

In 1244 Jerusalem was reconquered for Islam in a bloodbath by Khorezmian mercenaries from Central Asia who had fled west to escape the Mongols. King Louis IX of France, the last European monarch truly attached to crusading, was the West's only ruler to react to the loss of Jerusalem by taking the cross, thereby initiating the Seventh Crusade (1248–1254). Louis planned the crusade carefully. Supplies were sent to Cyprus in advance, and shipping was organized directly from southern French ports. The king sailed forth from Aigues-Mortes in August 1248 with Queen Margaret and a great army.

Damietta was again chosen as the first target. Remembering the horrors of 1218–1219, the citizens left without fighting. From Damietta, the crusaders marched out in November 1249 intent on attacking Cairo by way of the Nile Delta. As in 1221, Muslims cut off the crusaders. Infectious diseases broke out, and Louis was compelled to surrender to the sultan while trying to retreat toward Damietta. Queen Margaret had stayed behind in Damietta. Within a few months she gave birth to Prince John, organized the defense of the city, negotiated a treaty, and gathered ransom for the king. After surrendering Damietta in May 1250, the majority of crusaders sailed home. King Louis and his remaining force sailed to Acre, where the French king stayed until April 1254 rebuilding the defenses of the coastal cities. After Louis returned to France, the French maintained a garrison in Acre until 1286.

Louis IX never forgot the failure of 1250, and after the crusader city of Antioch fell to the

Mamluk sultan Baybars in 1268, Louis decided to take the cross for the second time. The crusade of 1270, sometimes called the Eighth Crusade, was planned to begin with the conquest of Tunis, a supplier of Mamluk Egypt, and the conversion of its emir, who Louis wrongly believed was ready to become a Christian. The landing near ancient Carthage was successful, but soon thereafter a severe epidemic broke out in camp. Among the dead were King Louis and Prince John, who had been born in Damietta. The new king, Philip III, who had accompanied his father and two brothers on crusade, was gravely ill, and his queen, Isabelle of Aragon, died while giving birth to a stillborn child. Because of Philip's incapacity, Louis's brother, Charles of Anjou, who had arrived on the day of King Louis's death, took over command of the army and negotiated a peaceful withdrawal and favorable truce with Emir al-Mustansir.

Prince Edward of England had planned to link up with King Louis at Tunis. With the retreat of the French from northern Africa, Edward's plans changed. He sailed to Acre by way of Sicily. Arriving there in May 1271, he campaigned off and on (largely off) for a year before giving his blessing to a peace treaty with the Mamluk sultan in 1272. On his way back home Edward discovered that his father, Henry III, had died, and Edward was now King Edward I.

Even before the ten-year truce of 1272 had run its course, the Mamluks of Egypt and Syria renewed their pressure on the last remaining Frankish holdings in Syria-Palestine. One by one they fell until finally Acre, the last remaining Latin stronghold on the coast of Palestine, fell to Sultan al-Ashraf in May 1291. With the loss of Acre the kingdom of Jerusalem came to an end, although Latin kings on Cyprus continued to bear the title of king of Jerusalem for several additional centuries.

The period of the great crusades to the Holy Land was over, but the crusades themselves had not ended. Throughout the fourteenth, fifteenth, and sixteenth centuries and arguably down into the seventeenth and eighteenth centuries, various Catholic powers in Europe continued to lay plans for the liberation of Jerusalem and battled Islamic forces, largely (but not always) the Otto-

man Turks, in the Mediterranean and even along the Atlantic coast of northern Africa, all in the name of holy crusade.

Counter Crusades and Jihads— From Zangi to the Reconquest of Acre, 1291

The First Crusade (1095–1099 or 1102) witnessed Latin Christian armies carving out small principalities in the Levant at the expense of Islam and various Eastern Christian polities. The crusaders were successful militarily, destroying a Seljuk Turkish army at Dorylaeum in 1097 and then besieging and taking the important cities of Edessa and Antioch on the way to their ultimate prize, Jerusalem. The Holy City was finally captured on July 15, 1099, and a substantial percentage of the population was put to the sword. The crusaders' attacks upon Islamic populations in Anatolia, Syria, and Palestine became a rallying point for Muslims throughout the region, and an Islamic counter-crusade developed at the beginning of the twelfth century.

Over the first decades of the twelfth century, the Latin crusaders consolidated their rule by systematically taking such eastern Mediterranean coastal ports as Tyre, Beirut, Jaffa, and Acre,

securing the means for direct reinforcement from Europe while extending in significant ways Western European involvement in the lucrative Mediterranean maritime trade routes. This was especially true for the Italian merchant cities of Genoa, Pisa, and Venice. By the 1140s the Christians controlled the Levant from the Taurus Mountains to the Sinai Peninsula, having carved out for Latin Christendom the County of Edessa, the Principality of Antioch, the County of Tripoli, and the Kingdom of Jerusalem.

But this period also saw the rise of Islamic resistance under two powerful Sunni Turkish rulers, Imad al-Din Zangi and his son Nur al-Din. Zangi used his position as *atabeg* (governor) for the young Seljuk prince of Mosul to capture Aleppo from the Christians in 1128. The Great Seljuk empire was now in decline, allowing Zangi to expand his influence and territory, culminating in the seizure of the crusader stronghold of Edessa in 1144. Zangi was assassinated two years later.

Nur al-Din built on his late father's legacy, taking the independent Islamic city of Damascus in 1154, then turning his attention on Egypt where the Shia Fatimid dynasty was in control. Under military pressure by the crusaders in Palestine, the Fatimids allowed Nur al-Din's forces to enter Egypt in order to keep the Nile under the banner of the Crescent. In 1169, Nur al-Din acknowledged that the Kurdish general Saladin (Salah al-Din Yusuf) represented his interests in Fatimid Egypt, not that he had much choice in the matter, and in 1171, with the death of the Fatimid caliph of Egypt, the authority of Sunni Islam was reinstated there. Saladin acknowledged Nur al-Din's nominal overlordship but in fact acted independently in Egypt.

Saladin proved to be an extraordinary general and statesman for the cause of Islam. After Nur al-din died in 1174, Saladin proclaimed the Ayyubid sultanate in Egypt (named after his father, Ayyub) and used his wealth and position there to begin a campaign to wrest control of Syria from his Islamic rivals. Over the next 13 years, Saladin acquired Damascus and Aleppo and gained nominal power over Mosul as well. Now the most powerful figure in Islam, Saladin marshaled his resources and challenged the crusader

► DEFENDING THE “KINGDOM OF HEAVEN”— TURCOPOLLES AND THE CRUSADER ART OF WAR

The challenge of maintaining Latin possessions so far from Western Europe forced the crusaders to seek new ways to meet their manpower needs. To supplement their numbers and readdress the tactical disadvantage to Seljuk horse archers, the armies of the various crusader states hired Turcopolles (Sons of Turks), indigenous mercenaries who served as mounted archers and other types of light cavalry, a way of fighting that was foreign to the heavy cavalry-based armies of Christian Europe. Turcopolles became a standard feature of crusading warfare, serving as large native contingents in the armies of lay rulers and the Military Orders while often retaining their own officers.

These troops came from various sources. The original Turcopolles were ex-Muslim soldiers who converted to Christianity because the early crusaders would not allow Muslims to serve in the military. If recaptured by Muslim forces, they were invariably executed as apostates. Subsequently, the term “Turcopole” was applied to the offspring of Christian and Muslim marriages and to Eastern Christians (Byzantine Orthodox and Armenian) who fought using Muslim equipment and tactics. In battle, Turcopolles usually rode quick, light, hot-blooded horses and fought with saber, javelin, or the short composite bow characteristic of Eurasian horse archers. They acted as scouts or flank guards, important duty in the mountainous terrain of the Levant. The Turcopolles became so important to the crusader art of war that their commander, the Grand Turcopolier, was a high-ranking officer in the king of Jerusalem’s chain of command, ranking just below his second in command, the marshal.

—Brian Todd Carey

states directly, obliterating a large Latin army at Hattin on July 4, 1187. That same year he besieged Jerusalem and negotiated the transfer of the city into Muslim hands on October 2, foregoing what would have certainly been a massive retaliatory bloodletting in revenge of the Christian sack of 1099. He also swept away most of the remaining crusader-state holdings with the exceptions of Tyre, Antioch, and Tripoli.

Saladin’s recapture of Jerusalem and adjacent lands precipitated the Third Crusade (1188–1192), pitting the Kurdish ruler against the capable English king Richard I. Richard and his army successfully retook most of the coastal plains, including the important port of Acre in 1191. And although Richard beat Saladin on the battlefield at Arsuf that year, the crusaders were ultimately unsuccessful in their main goal of recapturing the Holy City for Christendom. Still, the Third Crusade breathed new life into the crusader occupation. Saladin died in 1193, although his Ayyubid Dynasty would dominate the Near East for another 60 years.

Saladin’s successors controlled the Ayyubid sultanate from their capital in Cairo based on a loose confederation of princes ruling from such capitals as Damascus and Aleppo. These princes maintained their power against rivals through the use of soldier-slaves known as Mamluks, steppe warriors from southern Russia. The Ayyubids were powerful enough to resist the assault of the Fifth Crusade (1217–1221) on Egypt during 1218–1221 but weak enough to negotiate with the Holy Roman emperor Frederick II in 1229 to return Jerusalem to Christian control. Ayyubid continued to decline over the next two decades. In 1250 the Mamluk bodyguard in Cairo murdered the newly enthroned Sultan Turah Shah and seized Egypt, setting up a new ruling dynasty that would last until 1517. Other Ayyubid princes tried to reassert control over Egypt, but the appearance of a powerful new enemy in the East, the Mongols, realigned regional strategic priorities.

The Mongols first appeared in western Eurasia between 1236 and 1242 when Chinggis Khan’s grandson Batu Khan invaded Russia and Eastern Europe, forcing Christendom to mobilize against the steppe warriors. A succession problem in Karakorum possibly aborted the Mongol conquest of Europe, but hostilities against powers to their west resumed in 1256 when another of Chinggis Khan’s grandsons, Hulagu, attacked Islamic possession in the Near East. The Ismaili Order of the Assassins was eradicated in 1256, while Baghdad, the traditional seat of Islam since 762, was brutally sacked in 1258. Hulagu next turned his attention on the Levant but was

defeated and rolled back in 1260 by a Mamluk host at Ayn Jalut (the Spring of Goliath), which is located in the northern Galilee in present-day Israel. The significance of that defeat is debated by historians, but it did mark the deepest advance into Syria-Palestine by the Mongols.

In 1262 the strategic situation in the Near East changed radically. The Mongol empire founded by Chinggis Khan and expanded by his grandchildren was finally breaking into smaller khanates, often antagonistic toward one another. The two westernmost of these, the Golden Horde in Russia and the il-khanate of Persia centered in Mesopotamia (Iraq) and Iran, sought alliances with established powers. The Golden Horde formed an alliance with the Mamluks in Egypt, and the Il-khans sought to combine forces with the crusaders. For their part, the Latin Christians were enthusiastic about an alliance with the Mongols, but both the logistical challenges of linking forces so far apart and the gradual conversion of the Il-khans to Islam dashed Christian hopes. By the 1260s the Mamluks, fresh off an impressive victory at Ayn Jalut, began to press their advantage against remaining crusader states.

The architect of the Mamluk victory over the Mongols was Sultan Baybars I. He and his successor Kalavun whittled away at the remaining crusader strongholds, seizing Antioch in 1268 and Tripoli in 1289. Soon, only the port of Acre remained in Christian hands. Despite one last Christian reinforcement of Acre by Venetian and Aragonese galleys, the city was finally taken after a bloody siege at the end of May 1291 by a massive Mamluk army commanded by Kalavun's son and successor, al-Ashraf Khalil. The 200-year crusader occupation of the Levant was over.

The Baltic Crusades, circa 1150–1500

A frontier region between Christianity and paganism, as well as between Western (Latin) and Eastern (Russo-Byzantine) Christendom, the Baltic Sea formed a link among a number of culturally, linguistically, and ethnically diverse peoples. By 1400 paganism had at least officially been defeated by the Christian faith, but the division between the Christian denominations turned out to be a permanent one. In the course of the era of the crusades, the Baltic peoples became absorbed into the Western Church. Except for the Spanish Reconquista, no other crusade had such a lasting effect.

In the autumn and winter of 1146–1147, Bernard of Clairvaux, papal legate, was preaching in the territory of the German (Holy Roman) empire in order to win support for the Second Crusade in the East. The southern coast of the Baltic already had a long tradition of warfare between Christians and neighboring pagans, and numerous missions had been launched by the German archbishops of Bremen, Magdeburg, and Bamberg but without any major result. Now, in 1147, rather than fighting Muslims in the Holy Land, many among the Danish and Saxon nobility preferred to attack the heathen Wends to their east, and a number of Saxon lords requested leave to wage holy war against these pagans under the patronage of the pope.

As a result, Pope Eugenius III issued the bull *Divina dispensatione* in April 1147 declaring that those who fought against pagans in the Baltic would receive the same remission of sins as those who traveled to Jerusalem. By the formal inclusion of the northern pagans as the enemies of the Church, the original scope of crusading, the liberation of the Holy Land, was radically extended.

➤ CONVERSION OF THE FINNS

The Christianization of the Nordic countries was a parallel process to the establishment of permanent hereditary kingship. The king, backed by a military elite, played a central role in the founding of the Roman Church in the realm of medieval Sweden, which also included the area of present-day Finland. The Church, in return, provided important support for the institutionalization of central power.

The conversion of the Finns was a gradual nonconflictual development fueled by commercial exchange rather than a result of military campaigning. According to archaeological findings, a chain of early medieval chapels existed in Finland, and there is evidence of predominantly Christian burial practices there around 1040–1150, about the same time as in Dalecarlia and Gotland in present-day Sweden.

According to a later medieval legend, however, the Christianization of the Finns began in 1155 or 1158 with a Swedish crusade led by King Erik IX Jedvardsson (ca. 1153–ca. 1160) and the bishop Henry, later the patron saint of Finland. The tradition of St. Henry describes the Swedes slaying the pagans in a great battle and then returning to Sweden (where Erik was later venerated as Sweden's patron saint). Bishop Henry, who stayed behind preaching the gospel, was soon martyred by the savage tribesman Lalli. After the murder, Henry's sainthood became widely known through a series of powerful miracles. The funerary chapel in Nousiainen became a popular center of pilgrimage during the late Middle Ages.

Authentic twelfth-century sources concerning St. Henry do not exist. The earliest versions of the legend and liturgy of the saint date from the last quarter of the thirteenth century. Likewise, the first extant papal reference to St. Henry dates from 1296, and no document of canonization has survived. It seems probable, therefore, that the cult originated from later ecclesiastical imagination rather than a crusade.

—*Sini Kangas*

The first officially launched crusading campaign in the Baltic, the so-called Wendish Crusade, took place in the summer of 1147. The army consisted of Danish and Saxon crusaders under Duke Henry the Lion of Saxony and two rival claimants to the Danish throne, Sven Grathe (r.

1147–1157) and Canute V (r. 1147–1157), who first exchanged hostages before embarking on this common enterprise. After baptizing the garrison of the Wendish town of Dobin, the crusaders ravaged pagan lands and burned a pagan temple in Malchow. Next the army turned against the Christian city of Stettin, which narrowly escaped an attack by displaying crosses on the city walls. The crusader army dispersed in autumn with little to show in the way of success.

The Wendish Crusade hardly differed from a traditional summer raid against the pagans. This was, however, the start of systematic colonization of the southern Baltic by German-speaking settlers. The process took several centuries, gradually extending German control over Silesia, Prussia, Latvia, Estonia, and Lithuania up to Lake Peipus (Peipsi), which today lies along the border of Estonia and Russia.

After 1147, Danish kings continuously led expeditions against the Wends. In 1168 King Valdemar I (r. 1157–1182) established permanent Christian rule over the island of Rügen. Encouraged by Pope Alexander III in 1171, Danish interests then were directed toward Estonia. The crusade had little success until the battle of Lyndanese in 1219, which enabled the building of the fortress of Reval (Tallinn) in the same year. Danish grip on Estonia, however, remained limited to northern coastal cities.

In the spring of 1200 German crusaders set out toward the mouth of the River Düna under the newly consecrated bishop of Livonia, Albert of Buxhövdén. Riga was founded in the next year, and the founding in 1202 of the religious order of Sword Brothers as a permanent force under the bishop's command enabled the strengthening of German power in Livonia.

By 1215, campaigning was extended from Livonia toward Estonia, where crusader warfare was especially cruel despite papal complaints regarding the harsh treatment of pagans. Men were killed, women and children were taken into captivity, and villages were burned. Subsequent war parties ravaged the land between 1215 and 1224 until the area was exhausted by famine. Livs and Estonians responded by applying for the help of Russian princes.

Even though Orthodox Russians had not made any great effort to convert the Baltic lands,

they objected to losing the tribute paid for them by local chieftains. The conflict was soon extended into a struggle between the Eastern and Western Churches. The German conquest continued until 1242, when Prince Aleksandr Nevskii defeated the Teutonic Order at the Battle of Lake Peipus, thus bringing the order's eastern expansion to a halt.

After the death of Albert of Buxhövden, Livonia was taken over by the Teutonic Order. The Order, originally established in the Holy Land in 1198, had been invited to the area by the Polish prince Conrad of Masovia, who offered Kulmerland to the knights in return for the protection of the frontier against pagan Prussians. In 1237, the Sword Brothers were assimilated into the Teutonic Order.

By 1290 Prussia and Livonia were turned into an autonomous monastic state. Despite the setbacks of Prussian revolts in 1240–1249 and 1260–1283, the order was able to expand its power farther east toward Estonia, where the Danes were bought out in 1346. In Prussia a German-speaking population became dominant, while in Livonia and Estonia Germans remained a minority. In 1309 the headquarters of the order was moved from Venice to Marienburg in Prussia.

In 1386 Lithuania, the last pagan power in the Baltic, and Poland formed a dynastic union by the marriage of Lithuanian grand duke Jogaila (Jagiello) and Queen Jadwiga of Poland. As a condition for the marriage, the duke was converted to Catholic Christianity. In July 1410, a joint army of Poles, Lithuanians, Czechs, Russians, and Mongols gathered their forces and inflicted a crushing defeat to the Teutonic Order at the Battle of Tannenberg.

The Teutonic Order never recovered from the severe economic and political consequences of the defeat. Renewed warfare between Poland and the knights and the formation of the powerful Prussian League in 1440 dictated the gradual downfall of the Teutonic Order in the Baltic. In 1525 Grandmaster Albert of Brandenburg-Ansbach transformed the remaining Prussian lands into a hereditary fief of the Hohenzollerns. Similar development followed in Livonia, where Landmaster Gotthard Kettler likewise became a fief-holder under the Polish Crown in 1561.

By contrast to the southern Baltic, where feudal conquest and conversion went hand in hand, the conversion of western Finland, then under the control of Sweden, was conducted peacefully by the early thirteenth century, causing no major dispute between the freeholding peasantry and Swedish aristocracy. In eastern Finland, Tavastia, Savolax, and Karelia, the Eastern and Western Churches competed for religious power. In 1242 the first major conflict between Russians and Swedes over possession of Tavastia ended in Swedish victory. The first surviving peace treaty of Nöteborg (Pähkinäsaari) between Sweden and Novgorod, dated to 1323, ended a lengthy period of hostilities.

The Reconquista in Spain

Much of the early history of the Reconquista in Spain, the centuries-long effort by Christians to reconquer Spain, is shrouded as much in fiction as in historical fact. Primary sources do record that when Muslim armies, made up largely of Berber troops, crossed over from North Africa into the Iberian Peninsula in 711, the Visigothic rulers of Spain were quickly defeated, and the Muslim conquerors proceeded to take over almost all of the Iberian Peninsula. The Muslims were stopped in their advance into northwestern Spain in 718 at the Battle of Covadonga, and it is from this mountainous region called Asturias

that later traditions claimed to be the starting point for the Christian reconquest of Spain.

For approximately the next 300 years, the Muslim dynasty of the Andalusi Umayyads, based in their capital of Córdoba, exercised control over much of the Iberian Peninsula. The small Christian kingdoms across the northern tier of the peninsula had made modest advances and controlled the regions of León, Castile, Aragón, and Navarre and the county of Barcelona. However, with the fall of the caliphate of Córdoba in 1031, al-Andalus (Islamic Spain) broke apart into tiny entities called *taifa* (factional) kingdoms. With this breakdown in central authority in Muslim lands, the Christian Reconquista began again in earnest, and the capture of a number of cities, including Barbastro in 1064 and then Toledo in

1085 by the armies of Alfonso VI of León-Castile (r. 1065–1109), signaled expanding Christian control over central Spain.

In response to the growing Christian threat looming from the north, Muslim rulers in several of the *taifa* kingdoms appealed for assistance from a new power emerging in North Africa, a Sanhaja Berber tribe called the Almoravids. This puritanical Muslim sect had conquered what is today Morocco and Algeria and spread northward to Spain in 1086. During this same period of Almoravid rule can be found the exploits of Spain's medieval national hero, Rodrigo Díaz de Vivar, popularly known as El Cid (ca. 1043–1099), who during the course of his military career fought for both Muslims and Christians and came to symbolize the shifting allegiances typical in

relations between Muslims and Christians in medieval Spain.

In the end, Almoravid rule was short-lived, as many of the newly arrived North Africans succumbed to the temptations of the more sophisticated lifestyles enjoyed by the Andalusian Muslims. As a result, a Christian advance, spearheaded by the kingdoms León-Castile and Aragon, pushed the Almoravids below Spain's geographic midpoint by about 1140. The mortally weakened Almoravids were displaced by a second Berber fundamentalist army, the Almohads, that crossed over from North Africa in 1146, conquered much of the same territory previously held by the Almoravids, and brought to a momentary halt the Christian advance in central Spain. Even so, a combined army of Iberians and crusaders from the north on their way to the Second Crusade captured Lisbon in 1147, and by 1250 the kingdom of Portugal, led by the efforts of King Sancho II (r. 1223–1248), had pushed its frontiers to their final limit.

Meanwhile, the other Christian Spanish kingdoms had been disputing among themselves during the late twelfth and early thirteenth centuries to the point that Pope Celestine III (r. 1191–1198) and Pope Innocent III (r. 1198–1216) had to remind these rivals that Spain was a crusading zone and that they should be fighting the Muslims and not each other. Shortly thereafter, Alfonso VIII of Castile (r. 1158–1214) led the combined armies of Castile, Aragon, and Navarre (and with substantial assistance from Portugal, León, and the military orders) to a decisive victory over the Almohads at the Battle of Las Navas de Tolosa, not far from Jaen in southern Spain, on July 16, 1212. The battle dealt a heavy blow to Almohad rule in Spain, and this second Berber dynasty subsequently retreated back to North Africa. With the ensuing power vacuum, the Christian armies were able to conquer the major southern cities of Córdoba in 1236 and Seville in 1248.

The last stage of the Reconquista came with the expansion of Christian control over almost all of the Iberian Peninsula, with the only exception being the emirate of Granada at the southern tip of the peninsula. This tiny state was able to hold on for almost 250 years, in part because of the political and diplomatic skills of several of

Seville Cathedral and Giralda Tower in Spain. An example of Moorish architecture, the tower originally functioned as a mosque's minaret in the twelfth century. After the Reconquest of Spain by Christians, the minaret was converted into the bell tower of a Christian cathedral. (Corbis)

its early emirs and also because of the infighting that had broken out again between Spanish monarchs such as Castile's Pedro I the Cruel (r. 1350–1369) and his half-brother Enrique of Trastámara (r. 1369–1379), which resulted in a civil war and Pedro's eventual murder by Enrique. Such distractions often slowed down the progress of the Reconquista movement and gave the Nasrids, the last Islamic dynasty in Spain, room to maneuver and combat the Christians in the waning decades of Muslim rule.

With the marriage of Fernando II of Aragón (r. 1479–1516) and Isabel of Castile (r. 1474–1504), the two Christian kingdoms of Spain were united, at least militarily and diplomatically, and a ten-year siege of Granada began in 1482 that would be the last push of the Reconquista, resulting in a unification of Spain under Christian rule. The last Muslim ruler of Spain, Muhammad XII (known in Spanish as Boabdil), abdicated his throne and surrendered his emirate to Fernando and Isabel on January 2, 1492. The Christian reconquest of Spain was now complete.

Despite the centuries of warfare between Christians and Muslims in the Iberian Peninsula, these centuries also included prolonged periods

► SANTIAGO MATAMOROS

According to legend, the cult of St. James the Apostle (Santiago in Spanish) began at the Battle of Clavijo in 844, a battle that some historians dispute ever took place. Spanish Christians claimed that Santiago had traveled to Spain before his death between 41 and 44 CE, and his body had been returned miraculously to Spain and buried at Compostela. With the construction of a cathedral in the ninth century, Santiago de Compostela became one of the most important pilgrimage sites in medieval Europe. According to the story, Christian soldiers believed that Santiago had appeared on the battlefield wearing full armor, riding a white horse, and bearing a sword and a banner to lead them to victory over the Muslims. From that time on, sources record numerous sightings of Santiago Matamoros (Santiago the Moor Slayer) at battles between Christians and Muslims in the Iberian Peninsula until the last Islamic rulers of Spain were defeated in 1492. With the Reconquista completed in Spain, the cult of Santiago would be brought to the New World and used to motivate the Spanish conquistadors to fight the new infidels, the Indians of Central and South America. A number of early conquistadors, such as Hernán Cortés, were members of the military order of Santiago, which had been founded in 1170 in León, and their battle cry was “Santiago!”

—April L. Najjaj

of trade and cultural exchange among Spain's different religious groups. Américo Castro, one of the twentieth century's foremost scholars on Spain during the period of the Reconquista, coined the term *convivencia* to describe the prolonged economic, social, and cultural interactions common among Christians, Muslims, and Jews in the world of medieval Iberia. Other scholars have suggested the term “coexistence” to be more appropriate.

The mind-set of the Reconquista that prevailed throughout the Middle Ages in Spain, however, did not end in 1492. In the months toward the end of 1491, while the final siege of Granada was concluding, Christopher Columbus came to apply to Fernando and Isabel for funding to pay for a trip across the Atlantic Ocean to

reach the Great Khan in the Indies. The funds they ultimately provided to Columbus enabled him to travel to the New World, where the crusader mentality of medieval Spain found a new home. Likewise, early Portuguese expansion into the Indian Ocean and beyond was characterized by a similar crusader mindset.

—April L. Najjaj

Crusades against Heretics— From Languedoc to Bohemia

Historians have long debated what qualifies as a crusade. The traditional view for the past several centuries has been to recognize as proper crusades only those holy wars against Islam in the East that spanned the period 1096–1291 and had at least one of three goals: to liberate the Holy Land, particularly Jerusalem; to assist and defend Eastern Christians; and to defend or expand the crusader states. Yet the late twentieth century witnessed a shift in interpretation whereby a majority of crusade specialists abandoned the traditionalist model and embraced the pluralist model. The pluralist position envisions a longer crusading movement that extended well beyond the thirteenth century into at least the late sixteenth century if not beyond. It also envisions a broader movement that included large numbers of expeditions in Europe proper against Muslims, pagans, papal political opponents, and religious dissenters, or heretics.

The most well-known crusades against heretics were the Albigensian (1209–29) and Hussite Crusades (1420–31), which focused on religious dissenters in southern France (Languedoc) and Bohemia. The former, whose gathering storm, course of fighting, and long aftermath dominated southern French society and politics for most of the thirteenth century, ended in a Catholic victory and the eradication of heresy in its homeland. The latter, whose gathering storm, course of fighting, and long aftermath dominated Czech and German politics for most of the fifteenth century, ended in compromise and without the eradication of heresy in its homeland.

The Albigensians, or Cathars (the Pure) as they called themselves, were deemed heretical by the Catholic Church because they were dualists, believing in two gods, one for the spiritual world and one for the physical world. Many of the beliefs of the Albigensians were similar to the doctrines of Manichaeism, an eclectic faith that arose in Iran and Mesopotamia in the third century CE, and many of the forms of Gnostic Christianity that had flourished in the early centuries CE. Consequently, historians speculate that Catharism originated out of surviving strains of Gnosticism and Manichaeism in the East and traveled west along trade routes, eventually taking root in Languedoc and northern Italy. The southern French town of Albi, which gave its name to this religion, was one of its principal sites.

According to Inquisitors' records, the Cathars believed that the material world is evil, the creation of a god of darkness and corruption. Consequently, they advocated vegetarianism and nonreproductive sex along with a number of other practices that grew out of their rejection of corporeal existence. Perhaps most galling for the established Church, they rejected the sacraments including holy orders, which bestowed on priests their special powers and authority. The Roman Church had begun efforts to convert the Cathars to orthodox belief and practice during the twelfth century, when even the renowned St. Bernard of Clairvaux (1090–1153) preached against them. The Catholic Church's preaching efforts, however, were ultimately unsuccessful, as demonstrated by the existence of at least 11 Albigensian bishoprics in France and Italy by the end of the twelfth century.

THE INQUISITOR BERNARD GUI ON THE HERESY OF THE ALBIGENSIANS

"They [Albigensians] assert that they occupy the place of the apostles, and that. . . the Roman Church, namely the prelates, clerks, and monks, and especially the inquisitors of heresy persecute them and call them heretics, although they are good men and good Christians, and that they are persecuted just as Christ and his apostles were by the Pharisees. Moreover they talk to the laity of the evil lives of the clerks and prelates of the Roman Church, pointing out and setting forth their pride, cupidity, avarice, and uncleanness of life, and such other evils as they know. They invoke with their own interpretation and according to their abilities the authority of the Gospels and the Epistles against the condition of the prelates, churchmen, and monks, whom they call Pharisees and false prophets. . . . Then they attack and vituperate, in turn, all the sacraments of the Church, especially the sacrament of the Eucharist, saying that it cannot contain the body of Christ, for had this been as great as the largest mountain Christians would have entirely consumed it before this. They assert that the host comes from straw, that it passes through the tails of horses, to wit, when the flour is cleaned by a sieve (of horse hair); that, moreover, it passes through the body and comes to a vile end, which, they say, could not happen if God were in it."

—Andrew Holt

At the beginning of the thirteenth century the Albigensians were clearly growing in number and influence, especially throughout Languedoc, and the Catholic Church found itself increasingly concerned. During the reign of Pope Innocent III (r. 1198–1216), the Church intensified its activity in the region, and these efforts may have served as a provocation for the murder of a papal legate, Peter Castelnau, in 1208. The murder of the legate reportedly served as the spark for Innocent III's calling of the Albigensian Crusade that began in 1209. The nobility of northern France was quite willing to make war against

the wealthy nobility of southern France and responded vigorously to the pope's call for a crusade. The conflict continued with varying degrees of intensity for more than 20 years and did not end until the 1229 Treaty of Paris, which stipulated humiliating terms of surrender for Count Raymond VII of Toulouse. After 20 years of war, the land and vibrant culture of Languedoc were equally devastated. Then the Inquisition moved into the region and began the lengthy process of extirpating the heresy, with occasional outbursts of violence mostly related to the storming of various Albigensian strongholds and castles. The last known Albigensian leader (known as a "perfect") is believed to have died in the early fourteenth century.

The Hussite Crusades, also called the Hussite Wars, were a series of conflicts between Catholics (largely German Catholics) and the Hussites, followers of the Bohemian religious reformer John (or Jan) Huss. Following the death by burning of Huss (1415) as well as the execution of other important leaders of their movement, the Hussites drew up in 1420 the Four Articles of Prague, which demanded the freedom to preach, communion in both kinds (i.e., both wine and bread) for the laity as well as priests, limits on Church property, and the civil punishment of mortal sins including simony (trade for profit in spiritual goods, especially priestly offices). While the conflict between Catholics and Hussites began primarily over religious disagreements, a social divide between the landed and peasant classes as well as the nationalist loyalties of Germans and Czechs also contributed to feelings of mutual hostility.

In the wake of the death of Emperor Wenceslaus of Bohemia in 1419, the Hussites in Bohemia and Moravia banded together to prevent Sigismund, the former emperor's brother and their worst enemy, from coming to the throne. The Hussites had many military successes, as they were better organized and used superior tactics to repulse five crusades between 1420 and 1431. In frustration at so many reports of failure and in the wake of reported attacks on civilians by the Hussites, Joan of Arc in faraway France wrote a letter to Hussite leaders in 1430 threatening to lead a crusade against them. Yet Joan's threat

never came to pass, and the crusaders continued to meet with failure.

In 1433 the Council of Basel was called to provide a venue for negotiations between Catholic and Hussite leaders. Their efforts resulted in allowing a moderate faction of Hussites back into the graces of the Catholic Church, but this compromise was rejected by more radical Hussites. Finally in 1436 a further compromise agreement was ratified between Catholics and Hussites that recognized Sigismund as the king of Bohemia, bringing a temporary but much needed respite from major hostilities. Additional hostilities broke out in the decades to follow, with peace not really being made until 1478, but by then the religious element of the wars had largely disappeared. Regardless of the decreasing religious tenor of later hostilities, the fact remained that the Hussite movement had not been rooted out, and the facade of a single Western Christendom subject to the authority of Rome had been cracked.

In addition to the crusades launched against Albigensians and Hussites, the political crusades that took place in Italy (the so-called Italian Crusades) were often justified chiefly through accusations of heresy. Personal and collective accusations of heresy by the leadership of the Church were often leveled at the pope's enemies, such as Emperor Frederick II (r. 1212–50). Additionally, Catholic clergy complained about the growth of heresy that resulted from their opponents' successful military efforts. For example, in response to the Ghibellines' seizure of church property and abuse of Catholic clergy in northern Italy, Pope Urban IV (r. 1261–1264) lamented that the inability of churchmen to operate in such areas resulted in the spreading of heresy to such a degree that it even affected monastic houses.

Thirteenth-Century Mongol Campaigns, Conquests, and Setbacks

From 1209 until 1260 when the Mongol empire split into four warring khanates, Mongol armies marched across Eurasia in all directions and appeared unstoppable. During the reign of Chinggis Khan (1206–1227), the Mongols conquered much of northern China, Manchuria, and Central Asia to the Amu Darya River, although Mongol armies marched much farther than that. One force marched out of Central Asia, crossed the Caucasus and then back to the steppes of Kazakhstan, defeating all who opposed it, while other armies swept into Korea and Afghanistan and even penetrated India.

Ogedai Khan, the second Great Khan (r. 1230–1241), continued the trend by conquering the rest of China north of the Yangzi River and western steppe lands all the way to the border of Hungary, and also momentarily invaded and devastated Hungary and Poland. Other Mongol forces secured Afghanistan, Iran, and Transcaucasia. Only Ogedai's death and the subsequent contest for the Grand Khanate seem to have saved not only Europe, but much of the Middle East, and the rest of China, at least for the moment.

Between 1241 and 1250, few additional conquests took place. A Mongol army under Baiju conquered much of Anatolia, or present-day Asiatic Turkey, but during two long regencies and the brief reign of Ogedai's son Guyuk (r. 1246–1248), little in the way of sustained conquest occurred. Nonetheless, the Mongols raided neighboring states extensively.

In 1250, Mongke Khan (r. 1250–1259) came to power in a coup and sent an army to the Middle East to further expand the empire. Led by his brother, Hulegu, Mongol armies extended their control to the Euphrates, and most of Syria and Palestine, with the exception of the crusader

states, submitted. Meanwhile, Mongke and his brother Khubilai led armies against the Song dynasty in southern China. Mongke's death in 1259 brought the conquests to a halt. Civil war broke out in 1260 throughout the empire, as it split into four pieces. In this same year, in the west, a Mongol army suffered defeat in Palestine at Ayn Jalut, and the Mamluks of Egypt drove the Mongols out of Syria, occupying that region for themselves.

After the civil war, only Khubilai continued successful wars of expansion, primarily because he alone possessed the resources to deal with rebellions and external threats and still had a desire to conquer more territory. The rest of China fell in 1279. In addition, he launched unsuccessful invasions against Japan in 1274 and 1281. On both occasions Japan avoided conquest with the assistance of the *kamikaze* (divine winds), typhoons that destroyed the Mongol fleets. He also launched a series of unsuccessful invasions of various states in coastal and insular Southeast Asia, the largest being an invasion of Java in 1292. The various states and peoples of Southeast Asia played a successful game of guerilla warfare and paying tribute in order to convince the Mongols to depart.

Even with these setbacks, the Mongol empire stretched from the Sea of Japan to the Carpathian Mountains and Mediterranean Sea. Despite this overall record of success, the Mongols suffered a number of setbacks. Throughout their wars, the Mongols lost battles, and defeat was not unknown to them. When defeat happened, the Mongols typically viewed it as a momentary setback that would be rectified in the near future. It was only a question of when.

At times geography and climate proved to slow the Mongols. Lack of pasture in Syria prevented the Mongols from stationing sufficient troops to hold it against the Mamluks. The mountainous terrain and rice paddies of South China slowed the Mongols considerably as it took more than forty years to conquer it. Many Mongols also found the climate and diseases of South China not to their liking. A similar situation occurred when the Mongols entered India. Eventually, the Mongols decided that the long-term conquest of India was detrimental to their health solely because of the hot climate. This,

➤ AYN JALUT—HOW PIVOTAL?

In 1260, an army of Mamluks, led by Sultan Qutuz and his rival Baybars, advanced into Palestine and defeated a Mongol army led by Ket-Buqa on September 3 at Ayn Jalut, in what is today northern Israel. Initially, it appeared that a Mongol victory was near, but desertion by a Muslim vassal and a rally by Qutuz shattered the Mongol forces. Ket-Buqa died in the battle, and the Mamluks drove the remaining Mongols from the field and from Syria.

Often described as a turning point in history, one must ask how pivotal was Ayn Jalut? The key to the answer is one's perspective. For the Mongols, it was a minor setback. Indeed, the troops in the region were considered second rate. When Hulegu invaded Syria, he pulled most of his army back to Azerbaijan after hearing of the death in 1259 of his brother, the Mongol ruler Mongke Khan. Hulegu had no doubt that Syria could be regained and the Mamluks conquered. Unfortunately for the Mongols, civil war prevented their attempting this again until 1299–1300, and then they failed. Simply put, the lack of pasture in the region prevented them from garrisoning sufficient troops there.

From a non-Mongol point of view, the battle's importance only increased with time. For the Mamluks, the battle doubled their empire and inspired other Muslim forces. Not long after Ayn Jalut, a small Mongol army of 6,000 men entered

Syria, only to be defeated by a smaller Muslim army of 1,400 men-at-arms at Homs in 1260. Prior to this, most of the Muslim princes simply surrendered rather than face the Mongols. Thus the victory at Ayn Jalut restored their confidence.

The greatest consequence was the rise of Baybars (r. 1260–1277). After the battle, Baybars killed Qutuz and ruled the Mamluk state and set the foundation for the Mamluk sultanate, which lasted until the Ottomans conquered it in 1516–1517. Baybars then began the systematic destruction of the crusader holdings in the Near East, the last of which fell with Acre in 1291. Baybars also attacked Mongol allies in Lesser Armenia (Cilicia). In addition, Baybars allied himself with the Golden Horde, who became the Il-khanids' primary enemy, despite their shared Mongol blood and Islamic faith. This alliance helped ensure that the Il-khanids could rarely, if ever, focus their attention on the Mamluks.

Ayn Jalut's importance, while often overstated, nonetheless remains. It was not the first defeat of the Mongols or the last. Moreover, it was not the primary reason why the Mongols did not continue their conquests, as is often argued, but it did spell doom for the crusaders, who ironically, had allowed the Mamluk force to pass unhindered through the crusader states on their way to Ayn Jalut.

—Timothy May

however, did not preclude them from launching periodic raids.

Perhaps the biggest setback for the Mongols was the death of a Great Khan. Choosing a new ruler involved a lengthy process that required the presence of the generals and the Mongol princes, thus depriving the armies of leadership. As a result, until a new Khan came to the throne, little more than raiding occurred. Indeed, in many cases, highly successful campaigns ended because of the death of a Khan, such as in eastern Europe in 1241. Mongol armies decimated Hungarian and German forces, as well as a wide assortment of forces in Poland. There is little reason to think that the Mongols would not have continued to move west if not for the death of Ogedai.

Ultimately what halted the Mongol conquests was not so much defeats from external enemies, but rather civil wars. As the four khanates entered a period of almost perpetual warfare, their resources became focused on these endeavors. During lulls, all of the khanates launched other invasions, such as the aforementioned attacks by Khubilai Khan. In addition, Poland and eastern Europe suffered from a number of raids, as did India and Syria. Yet, conquests like those of the thirteenth century did not manifest themselves due to dissension with the empire.

The Later Crusades

While much attention has been devoted to the eight relatively well-known crusades to the Holy Land (from 1096 to 1272), considerably less attention has been paid to the crusading movement that followed. In fact it is only a recent development in crusading historiography that these later efforts are considered crusades at all. Scholars have generally followed the lead of historian Norman Housley in assigning the so-called later crusades to the period beginning with the Second Council of Lyon in 1274 and ending with the signing of a Spanish-Turkish truce in 1580. Other historians have assigned an even later date for the end of the crusading era, placing it during the reign of Peter the Great in the early eighteenth century. During this period hundreds of conflicts took place from Russia to North Africa and throughout Europe as Christians crusaded against political enemies, Muslims, pagans, and heretics.

Although efforts to expel Muslims from Spain began in the eighth century, it was not until the eleventh century that the Reconquista, the Christian reconquest of the Iberian Peninsula, began in earnest. The growing legitimacy of Holy War in Christian thought and the disunity that affected Muslim Spain following the collapse of the Cordoba caliphate in 1031 provided the inspiration and opportunity for Christian armies to go on the offensive. Over a period of five centuries Iberian, French, and other European Christians launched a series of wars, initiated alliances, and made truces with each other (and sometimes their Muslim opponents) in an effort that would ultimately bring the whole of Iberia under Christian control. The crusaders' efforts only ended

with the capture of Grenada, the last Muslim stronghold in Spain, in January 1492.

Later crusading efforts were also directed toward pagans (those not of the Abrahamic faith) in northern Europe. The so-called Northern, or Baltic, Crusades consisted of military conflicts in the name of Christianity that were waged around the Baltic from the mid-twelfth century into the sixteenth century. They began when Scandinavian rulers found themselves shut off from the long-range overseas conquests of the past and challenged by the newly invigorated Slavic peoples at home. Arguably, the crusading movement against pagans began with the papal authorization in 1147 of a holy war against the so-called heathen of the North and ended at the Russian frontier when the final crusading bull against pagans was issued from Rome in 1505.

Crusading efforts against pagans in Europe were intensified with the end of crusading efforts in the Holy Land at the end of the thirteenth century, which made available considerable additional manpower and resources. After the fall of Acre in 1291, the Teutonic Order moved its headquarters first to Venice and then, in 1309, to Prussia. As the Teutonic Knights established themselves in Prussia and Livonia, their crusading policies came to dominate the foreign policy of these states. As a result, the Teutonic Knights increasingly found themselves waging controversial

» ACCOUNT OF PREPARATIONS FOR THE BATTLE OF LEPANTO, OCTOBER 7, 1571

The following is from an account of the sixteenth-century historian Gianpietro Contarini.

“Then they hoisted their banners and standards on their galleys, and on his Catholic Majesty’s *Reale* [Philip II of Spain’s royal flagship] that of the Holy League was raised, on which were the arms of the three allied powers [Spain, Venice, and the papacy]. Every other kind of banner, pennant and insignia was unfolded, both on the flagship and on all the other galleys, as decoration, celebration, and to raise everybody’s spirits. . . . Almighty God, the Father, Son and Holy Ghost, was invoked with devotion, and His name, together with that of the most blessed Virgin Mary, His mother, was saluted by all in a loud voice. Quickly the priests, and many galley-captains as well, went from stern to bow with crucifixes in hand, exhorting and encouraging everybody, with devout and efficacious remarks, to consider Him, who at this point had descended from Heaven in person to fight against the enemies of His most holy name. Inflamed and moved by such exhortations, they all became one body, one will and one desire. Without a moment giving heed or thought to death, they prepared to fight for Jesus Christ.”

wars against Polish and Russian Christians. By the end of the fourteenth century the vast majority of Lithuanians had converted to Christianity and formed a military alliance with Poland to fend off the Knights. The most significant early victory to result from this alliance took place during the First Battle of Tannenberg in 1410, after which the badly defeated Teutonic Knights were effectively crippled as a force in the region.

The later crusades also included military expeditions against heretics. Perhaps the most notable later crusades against heretics were the five unsuccessful expeditions launched against the followers of the Bohemian religious reformer

John (Jan) Huss in the early fifteenth century. Also counted among the later crusades against heretics are the military campaigns launched by the papacy against Italian political opponents during the thirteenth and fourteenth centuries (the so-called Italian Crusades), which were often justified through contentious accusations of heresy.

The expansion of the Ottoman Turks during the fourteenth through seventeenth centuries also provided inspiration for crusading. The stunning military successes of the Ottomans against European powers during this period could not be ignored, as they carved out an empire that included all of Anatolia and the Balkans, totally swallowing up the remnants of the Byzantine empire in the process, and drove deeply into central Eastern Europe. Yet Europe’s initial crusading efforts against the Ottoman Turks proved futile. A crusader army was crushed at the Battle of Nicopolis in 1396, after which many European leaders fell into Turkish captivity. A Hungarian-Polish army was defeated at Varna in 1444, and this was soon followed by the Turks’ conquest of Constantinople in 1453. Athens fell in 1456, and by 1478 Serbia, Bosnia, and Wallachia also came under Ottoman control. The Ottomans even succeeded in briefly establishing a base for further military operations at Otranto in Italy in 1480, which caused fear that Rome itself could fall to a Turkish attack.

During the sixteenth century European crusading armies experienced a change in fortunes against their Ottoman opponents. The Ottomans were defeated when they besieged Vienna in 1529. The Christian success at Vienna was followed by other crusading victories, of which the most well known happened at Lepanto in 1571 under the auspices of the so-called Holy League. It was there that a coalition of Christian forces, including the Knights of Malta, defeated the Turks in a naval battle off the coast of western Greece. Following Lepanto, the Habsburgs and Venetians continued to battle the Turks well into the seventeenth century.

Perhaps the most notable conflict that took place during this period was the second siege of Vienna in 1683. Although greatly outnumbered, the inspired leadership of Jan III Sobieski led the combined Habsburg and Polish forces to victory

over the invading Ottoman army. The Christian victory marked a turning point for the Central European powers in their centuries-old struggle with the Ottomans. Christians followed up this success when Pope Innocent XI formed a new Holy League in 1684. The league was initially comprised of Habsburg Austria, Venice, and the Polish-Lithuanian Commonwealth, with the Russian empire later joining the league in 1686. The league engaged in a series of successful wars with the Ottomans and ended in success in 1699 when the Ottomans were forced to cede considerable territories to the members of the Holy League with the signing of the Treaty of Karlowitz.

In the wake of the Treaty of Karlowitz, the Russian tsar Peter the Great (sole ruler from 1696 to 1725) continued crusading efforts against the Ottomans. Since 1698, Peter had been sending observers to learn of the training and abilities of the Knights of Malta and inquire on the possibility of future joint ventures with the knights against the Turks. In 1711 Peter attacked the Ottomans in a "crusade" that proved disastrous for the tsar and resulted in the return to the Ottomans of lands originally acquired by Peter from the Turks at the end of the seventeenth century.

The Hundred Years' War

Perhaps the signature war of Europe's Late Middle Ages (1300–1500) took place between Eng-

land and France and their respective allies. Known as the Hundred Years' War, this 116-year-long conflict (1337–1453) was one in which the English won most of the memorable battlefield victories but the French won the war.

The war began when England's King Edward III (r. 1327–1377), grandson of the French monarch Philip IV (the Fair), laid claim to the French throne when the French king, Charles IV, died without a male heir. To further complicate matters, Edward was also a major landholder in France, with titles and possessions dating back to the Norman conquest of England in 1066. Piracy in the English Channel and territorial disputes in Gascony acted as a primer for the war, which broke out in May 1337.

For most of the conflict the initiative lay with the English, and the main fighting and devastation took place nearly exclusively in France. Militarily, the Hundred Years' War pitted a uniquely English style of defensive warfare against the more orthodox and offensively orientated French brand of battle typical of continental warfare. Although the French way of war was in appearance a combined-arms army (one that balanced horsemen and footmen), its overreliance on heavy cavalry lancers precluded them from fully using their archers and crossbowmen. In these campaigns, the French would continue to use what had been successful for centuries, while the English showed an amazing ability to adapt tactically during the long war. These two tactical systems clashed numerous times during the Hundred Years' War, with the French suffering defeat at the hands of English longbowmen right from the beginning of the conflict at the naval battle of Sluys (1340) and later on land at Morlaix (1342), Auberoche (1345), St. Pol de Leon (1346), and Crecy (1346).

After Crecy, Edward III continued to press his advantage in France, this time against the new French king, John II (r. 1350–1364). The English monarch had a powerful and capable subordinate in his son, Prince Edward (the Black Prince), who now commanded an army of his own. Prince Edward launched a mounted raid, or *chevauchée*, in central France, provoking a response from King John, who trapped the Black Prince outside of Poitiers in September 1356. Taking cues from his father's success at Crecy,

THE MAID OF ORLÉANS

Joan of Arc (1412–1431) was born a well-to-do peasant in the region of Champagne. The youngest of five children, she never learned to read or write but was apparently skilled in sewing and spinning. At the age of 13 she heard the voices of angels and saints, who eventually encouraged her to cut her hair and come to the aid of one claimant to the throne of France, the Dauphin Charles. At age 16, Joan convinced the Dauphin himself of her mission. After passing an examination by leading French theologians, Joan was given the rank of captain and sent to rally the French defenders at the besieged city of Orléans.

Dressed as a knight, Joan began her military successes with the relief of Orléans during May 1429, earning her the title “Maid of Orléans.” This miraculous victory was followed up with another against the English at Patay along the Loire River. With the invaders clearly on the run, the Dauphin was crowned King Charles VII of France at Rheims Cathedral two months later on July 18. But the relationship between Joan and her liege soured when Charles insisted on a truce with the English, something that the Maid of Orléans could not tolerate.

A year later, Joan was captured by the Burgundians (longtime allies of the English) and sold to the English. The English charged her with heresy and witchcraft. The records of the trial reveal the simplicity and nobility of the virgin warrior as well as the determination of the English and their French accomplices to find her guilty. Joan was burned at the stake in Rouen on May 30, 1431, her death supposedly serving English aims. Ironically, the Maid of Orléans’s martyrdom became a rallying point for nascent French nationalism, and her ultimate objective, the expulsion of the English invaders, was reached within a generation.

—Brian Carey

Edward seized a strong defensive position on broken ground and waited for the inevitable French attack. Once again, the English lines held while the longbowmen decimated the attacking French horsemen and footmen. King John was captured, and by 1360 there was a break in the war with the signing of the Treaty of Brétigny. The English strategy paid huge dividends, forcing the French to confirm the widest extent of

lands held by the English Crown in nearly 200 years.

With lands in France seemingly secure, King Edward and the Black Prince set their sights on spreading English influence in Spain. Edward III allied with Castile to benefit from its fleet, while Prince Edward campaigned to aid Pedro I of Navarre. As the English intrigued in Spain, the new French king, Charles V (r. 1364–1380), surrounded himself with able mercenary commanders and, ignoring the Treaty of Brétigny, set out to regain lost French territory.

The most capable of Charles’s new commanders, Bertrand du Guesclin, rose to fame through his defense of Rennes in 1356–1357 and defense of Normandy against a Navarrese royal expedition in 1364. A minor noble from Brittany, du Guesclin became constable of France in 1370, defeating the English in Spain at Montiel and winning back Poitou and Saintonge in France. He even pursued the English into his native Brittany between 1370 and 1374. He died on a military expedition in Languedoc in 1380. But by that time, the French had seized the initiative. English campaigns in Spain did not help their cause, and the heavy taxes raised to support these campaigns undermined English control of their French territories. The French continued to build on their successes, even launching naval raids on England’s southern ports. By 1400 English possessions on the continent had dwindled to Calais and a strip of coast stretching from Bordeaux to Bayonne in Gascony. But English fortunes would soon change with the ascension of King Henry V to the throne in 1413.

A man of unlimited ambition and great military skill, King Henry V (r. 1413–1422) decided to take advantage of the political division in France and revive Edward III’s claim to the French throne. After successfully besieging the city of Harfleur, Henry set out for Calais with a small army. The English army would be overtaken by a larger French host near the village of Agincourt in late October 1415. The resulting Battle of Agincourt pitted English longbowmen and dismounted knights against the flower of French chivalry, and once again the English won a spectacular victory.

Henry V went on to conquer Normandy and negotiate the French Crown for his dynasty. In

1420 he signed the Treaty of Troyes and married the French princess Catherine of Valois (daughter of the periodically insane Charles VI, who agreed to take Henry V as his regent and successor). But sickness overtook the brilliant English king and resulted in his untimely death in 1422 at the relatively young age of 35. Charles VI (r. 1380–1422) died only two months after Henry, and the future of France was again in question.

The final phase of the Hundred Years' War is closely associated with the reign of the French monarch Charles VII (r. 1422–1461). After the death in 1431 of Joan of Arc, whose short-lived but spectacular military career in 1429–1430 had turned the tide in favor of the French, Charles continued to press his advantage. He made peace with Burgundy in 1435, denying England its most potent ally on the continent. He liberated Paris from the English a year later after a 14-year occupation. After their defeat at Fromigny, the English lost Bayeux and Cherbourg and consequently their traditional bastion of Normandy. The French went on to dislodge the English from their stronghold at Bordeaux in Gascony, the same region that sparked the conflict 116 years before. By 1453 only Calais remained as an English possession; the English would continue to hold Calais until 1558. The war, however, was over.

Wars in Japan

With the exception of the Mongol invasions (1274 and 1281), Japan's wars from the eleventh

to the fifteenth centuries represent the violent process through which the samurai class (mounted warriors from the lower court aristocracy and provincial elites) wrested power from the imperial court in Kyoto. War during this time was conducted by relatively small bands of samurai (several dozen to a few thousand in number) supplemented by foot soldiers belonging to individual warrior households. Initially, politically connected warrior aristocrats, whom the court called upon to restore order through military intervention, mustered these forces through private warrior networks (*bushidan*) that they had established while serving as imperial provincial governors. Even in the midst of organized military campaigns, members of bushidan preferred individual combat in order to prove their martial skills and attain honor and status among their peers. The individualistic nature of Japanese warfare remained the general rule until the sixteenth-century introduction of European firearms undermined the tactical superiority of mounted warriors over foot soldiers.

Until the twelfth century the imperial court maintained its control over the samurai. However, rumblings in the eastern provinces of the Kanto (modern-day Tokyo region) presaged samurai independence. From the rebellions of Taira Masakado (935–940) and Taira Tadatsune (1028–1030) to the Early Nine Years' War (1051–1063) and the Later Three Years' War (1083–1087), the imperial court called upon the warrior aristocrats, particularly the Taira and Minamoto clans, to subdue eastern warriors who rejected imperial authority. Warfare resulted in the desolation of the countryside as both rebel and imperial forces destroyed their enemy's economic capacity to perpetuate war. Buildings, granaries, fields, and even peasants and livestock were easy targets when an enemy refused to engage in direct combat. In the war's aftermath, provinces were often granted tax relief for many years. This kind of destructive war continued until the sixteenth century, when warlords preferred to preserve the productivity of the land they conquered in order to utilize its wealth immediately.

From the twelfth to the fourteenth centuries incessant warfare vividly illustrated the samurai's incremental displacement of the imperial court as the masters of Japan. This process originated

➤ GEMPEI WAR, 1180–1185

Ostensibly a conflict for supremacy over the samurai class waged by the Taira (Heike) and the Minamoto (Genji) clans, most warrior houses joined the side that appeared most advantageous, regardless of bloodlines. Indeed, the most significant divide between Taira and Minamoto supporters was geographical, and local rivalries over land and resources became enmeshed in the empire-wide conflict as parties justified self-serving violence in the name of either Minamoto or Taira.

The preference of self-preservation over clan loyalties is clearly revealed by the support of clan chief Minamoto Yoritomo by a minor Taira family, the Hojo. Attempting to eliminate a future Minamoto threat, Taira clan chief Kiyomori ordered the Hojo to foster Yoritomo after his father's execution in 1159. In fact, Yoritomo became their son-in-law, ensuring that a Minamoto triumph would mean influence and power for the Hojo if not for the Taira. Yoritomo's largest bloc of support came from the eastern provinces of the Kanto (modern-day Tokyo), where a tradition of fierce independence had long been cultivated and Minamoto warrior networks were strongest. Taira warrior networks, on the other hand, extended west from the Kyoto region to Kyushu, where the imperial court had long dominated affairs. In effect, Yoritomo's victory (assisted no doubt by a timely drought in the western provinces that diminished Taira capacity to wage war) gave credence to the eastern samurai reputation as fierce warriors and earned for the Taira a reputation as effete courtiers who had lost their taste for battle.

—David G. Nelson

in the power struggles among court officials and the imperial family. Aristocrats turned to the military might of samurai clans, particularly the Taira and Minamoto, in order to outmaneuver their political rivals. Beginning with the Hogen Disturbance (1156), followed by the Heiji Uprising (1159), and culminating in the Gempei War (1180–1185), a fractured court lost much of its real power, first to the Taira and then to the Minamoto, the latter of which established the Kamakura shogunate in 1192, formalizing the independence of samurai authority from the imperial court. The subservience of the imperial

court was ensured after the Jokyu Disturbance (1221), when retired emperor Go-Toba attempted but failed to destroy the shogunate by rallying warriors dissatisfied with the shogunate. Even the crisis of the Mongol invasions in 1274 and 1281 only increased shogunal authority; the imperial court officially authorized shogunal command over all warriors, vassal and nonvassal alike, in order to establish a unified defense of Japanese territory.

The death knell for imperial authority came only after a brief return to absolute imperial power in the midst of the Genko War (1331–1336). Sitting emperor Go-Daigo, steeped in Confucian learning, orchestrated the downfall of the Kamakura Shogunate in 1333. This was only possible after several key Kamakura generals, in particular Ashikaga Takauji, turned upon their former masters. Once Go-Daigo revealed his intention to ensure samurai subservience, however, Takauji moved against Go-Daigo by supporting another claimant to the imperial throne. In 1336 Go-Daigo fled the capital and established a court in exile, thus providing others with justification (until a 1392 reconciliation within the imperial family) for violence against the new Ashikaga shogunate. From its headquarters in Kyoto's Muromachi district the Ashikaga completely dominated the imperial court, completing the samurai assumption of power.

The Ashikaga shogunate, weakened by strife deriving from imperial division, became so intertwined with the court aristocracy that it failed to maintain sufficient ties to the provinces. The shogunate's military governors wielded a great deal of power in the new regime, and any personal disputes among the most powerful governors had the potential to cause a civil war. This was exactly what caused the Onin War (1467–1477). A shogunal succession dispute gave cause to expand these personal rivalries into full-scale war. Unfortunately, the call to arms quickly escaped the control of the rival military governors. Local warriors called up to fight chose instead to seek the betterment of their own circumstances, turning upon their neighbors and even against their superiors, up to and including the military governors and shogunate. While a relative calm was established in 1477, Japan had officially entered the Sengoku (Warring States) period, a

century-long civil war in which local warlords, called *daimyo*, established their own control of the provinces.

Timur-i Leng's Campaigns

Timur (1336–1405) was born near Samarqand (in present-day Uzbekistan) in 1336 as a member of the Barlas tribe, a tribe of Mongol origin but thoroughly Turkic in ethnicity by the fourteenth century. In his youth, Timur was a minor leader and sometimes bandit amid the disorder that existed in central Asia as the Mongol empire dissolved. With the collapse of the Mongol empire, new opportunities arose, and Timur prospered, serving as the lieutenant of his brother-in-law Emir Husain. Before a falling out between the two in 1370, they gained control of Mawarannahr (Land across the River, or the Amu Darya), also known as Transoxiana. Timur emerged the victor in this fraternal dispute.

Timur spent the next decade consolidating the region under his control and defending it from raids by the remnants of the Chaghatai khanate. However, he became embroiled in external events in 1380 when he lent support to Toqtamysh, a prince of the khanate of the Golden Horde in Russia and Ukraine, who was embroiled in a civil war. Timur viewed this as an opportunity to secure his border and gain influence with the Golden Horde. Also in the 1380s, Timur decided to expand his state and crossed the Amu Darya into Persia and Afghanistan. By 1394 the regions of Fars, Iraq, Armenia, and Georgia had succumbed, but it is unclear if he

Timur's army storms Bhatuir in 1398, from a Persian miniature. (Bildarchiv Preussischer Kulturbesitz/Art Resource, NY)

wanted to create a stable empire or simply preferred to plunder.

At the same time, Timur's protégé, Toqtamysh, challenged Timur's authority. As a descendant of Chinggis Khan, Toqtamysh viewed himself as the rightful leader of the world of the post-Mongol empire. Toqtamysh invaded Timur's empire in 1385 and 1388, defeating Timur's generals twice. In retaliation, in 1391 Timur invaded the Golden Horde and defeated Toqtamysh. Toqtamysh quickly regained power and invaded Timur's empire again in 1395. This forced Timur to pursue Toqtamysh, and at the Battle of the Kur River, Timur defeated him. Then, Timur broke the power of the Golden Horde by inciting and supporting various contenders for the throne and destroying the cities of Sarai and New Sarai. He also ensured that none of the contenders could threaten his power. While Timur destroyed the Golden Horde's power, he did not incorporate it into his empire, perhaps realizing that as a non-Chinggisid prince he would never be accepted as the ruler in that region.

➤ MARCHING THROUGH GEORGIA

Timur invaded the Christian kingdom of Georgia, located in the Caucasus Mountains, several times. The first invasion occurred during the summer of 1386. As with most of Timur's campaigns, the destruction was incredible, and also as with many of his campaigns, Timur justified the invasion as a jihad against infidels. By the winter of 1386, the Georgian capital, Tbilisi, was sacked, and King Bagrat V was hauled away in chains. Timur released him after Bagrat converted to Islam, which Bagrat renounced once Timur departed Georgia.

The second invasion occurred in 1394–1395. This time, however, it was more of a pillaging expedition, as Timur was passing through to invade the Golden Horde's territory. However, the incursion laid the foundation for a third invasion when the Georgians defeated Miranshah, Timur's son, in battle.

In 1399 Timur revenged Miranshah and devastated eastern Georgia. Then in the spring of 1400 he marched on Tbilisi, pillaging and burning all before him. King Giorgi VI, who fled to the mountains, agreed to pay tribute, whereupon Timur departed to deal with the Mamluks.

Yet Timur was not finished with Georgia and returned in 1403 after defeating Bayazid at Ankara. It is alleged that Timur destroyed 700 villages and towns, which included the massacre of their citizens. Furthermore, he demolished every Christian church he encountered. Rather than face Timur, the Georgian nobility fled to their mountain fortresses, but sometimes not even this was enough to escape his wrath.

—Timothy May

Timur's next target was in India invading the sultanate of Delhi in 1398. His armies sacked and burned Delhi in a wanton display of destruction. As always after a campaign, wealth from the plunder poured into his capital at Samarqand. The sultanate never fully recovered.

Despite the massive haul of plunder from India, Timur did not remain at his capital. In 1399 he marched west against the Mamluk sultanate in Egypt and Syria and the Ottoman empire in Anatolia, as both had supported rebellions against him. In 1401 Timur invaded Syria and defeated the Mamluks, sacking Aleppo and Damascus in

the process. He then invaded the Ottoman empire and crushed Sultan Bayazid at Anakara in 1402. Bayazid was taken prisoner and was marched off to Central Asia as Timur again left two more empires in turmoil rather than conquering them.

With his western frontier secure from the threat of attack, Timur returned to Samarqand in 1404. Despite being carried in a litter for most of his later campaigns, Timur did not plan a life of ease yet. Instead, he planned an invasion of China. The invasion ended prematurely, as Timur died on January 19, 1405, in the city of Otrar. Although he had designated a successor, his empire, held together primarily through the force of his will, quickly disintegrated into smaller states ruled by his sons and grandsons, the Timurids.

Ottoman Conquests to 1500

The Ottomans were one of the Turkic clans that emerged when the Mongol invasion ended Seljuk rule in Anatolia in 1243. The Ottomans linked their origins to Central Asian Turkic nomads, describing their founder Osman (1290–1326) and his ancestors as heroic men who dedicated their lives to jihad at the Christian frontier. This honorable image, however, was a later construction, and Osman was actually the leader of a band of Muslim and Christian men who made their living by pillaging the Byzantine frontier.

Osman's most important conquest was a small town named İnegöl (1299), whereas his son Orhan I (r. 1324–1362) conquered Bursa (1326), Nicaea (1331), Nicomedia (1337), and Adrianople (1361), each a Christian metropolis left largely defenseless due to the Byzantine empire's weakening position. Meanwhile, the Ottomans also formed alliances with local Christians. Orhan's first wife was Greek. Inasmuch as he had helped

➤ BAYEZID THE THUNDERBOLT

Bayezid I (r. 1389–1402) took the Ottoman throne after his father Murad was assassinated during the Battle of Kosovo in 1391. Bayezid's first military campaign was the siege of Constantinople, but when King Sigismund of Hungary started to harass Ottoman territories, the Ottomans abandoned the siege and attacked Sigismund's army, defeating the Hungarians in 1392. Bayezid then commenced attacks on Muslim lords in Anatolia, seizing Kayseri, Sivas, Samsun, and Sinop. He also focused on the Venetian territories in the Aegean. By 1395 the Ottomans possessed an area from the Adriatic to Hungary, excluding only the cities of Athens and Constantinople. In 1396 the Ottomans renewed the siege of Constantinople, which initiated the formation of a Christian crusade. The crusaders were defeated in the Battle of Nicopolis, and a new peace treaty made Bayezid suspend the harassment of Constantinople.

Meanwhile, Bayezid's campaigns against Muslim Anatolian lords were criticized, and the defeated lords sought help from Timur-i Leng (Tamerlane).

The two leaders clashed, first verbally and then militarily, in the Battle of Ankara (1402). Bayezid's Tatar allies deserted him, and even his sons left the battlefield when they saw Timur's superiority. Bayezid was captured, put into a cage, and paraded about as Timur's court traveled from one city to another. Bayezid died the same year, probably poisoning himself.

The Ottomans always questioned Bayezid's wisdom. His deviation from the siege of Constantinople, his attacks on Muslims, his careless language and temper, his drinking habits, and his marriage to a Christian princess were blamed for his downfall. In the West, Christopher Marlowe's (1564–1593) play *Tamerlane* immortalized Bayezid as the tragic figure who stopped the crusaders but fell prey to a Muslim tyrant. Later on, Jean Magnon's play *Le Gran Tamerlan et Bejezet* (1648), Handel's score *Tamerlano* (1725), and Vivaldi's *Bayezid* (1735) as well as numerous European paintings explored this historical character.

—Murat Cem Menguc

bring John VI Cantacuzenus (r. 1347–1354) to the Byzantine throne in 1346, Orhan, albeit often an enemy of Byzantium, was a guest of honor in the celebrations and was married to John's daughter Theodora.

In their newly gained territories, the Ottomans transferred legal authority to Muslim scholars and converted churches to mosques, but they also allowed Christian worship and kept the economy intact. Bursa was their capital city until 1363. During Orhan's son Murad's reign (r. 1361–1389), southern Bulgaria and Thrace were annexed during 1363–1365, and a victory at Chermanon in 1373 forced local Christian rulers to accept vassalage. After Sofia was taken in 1385, a Christian-Balkan coalition was formed, but the Ottomans defeated them at Kossova-Polje in 1389.

Rapid expansion generated unprecedented quantities of booty. Murad is described as the first Ottoman ruler who hoarded a treasury, and he was accused of abandoning the modesty of his ancestors. A slave tax was introduced, and the palace began to collect young Christian men,

converting them to Islam and forming an elite military corps with them. They later evolved into janissaries (new troops), the most important division in the Ottoman army for centuries.

The Ottomans depicted their military campaigns as an Islamic venture, but they fought their Muslim adversaries too. They seized the Muslim city of Ankara in 1356 and campaigned vigorously against the Karamans of south-central Anatolia, who became their main Muslim rival in the struggle for supremacy over the subcontinent. During such expeditions, non-Muslim mercenaries and Christian Slavic lords from Thrace assisted the Ottoman army.

Murad's son Bayezid (r. 1389–1402) inherited a domain that spread from the Danube to the Taurus Mountains. Although he gained fame for defeating the crusaders in the Battle of Nicopolis (1396), he was brought to a tragic end by his later mishaps. In the Battle of Ankara of 1402, he was defeated and captured by the Turkic Muslim amir Timur-i Leng and later died as a war prisoner. Bayezid's death caused an interregnum from which his son Mehmed I (r. 1412–1421) emerged

as the victor. Mehmed reconsolidated Ottoman power, in 1414 defeated the Karamans (who tried to take advantage of the civil war), and built fortresses along the Danube to seal the borders, all while raiding Hungary, Bosnia, and Styria. All along, he maintained peace with Constantinople, where his half brother Mustafa was kept prisoner.

When Mehmed died, Mustafa was released to initiate a civil war. Assisted by the Genoese, Mehmed's son Murad II (r. 1421–1451) defeated his uncle in 1422 and put Constantinople under siege. Soon the Byzantines and Karamans formed an alliance and armed another Mustafa, Murad's half brother, to fight against him. Murad abandoned the siege and defeated his half brother, which sealed his legitimacy. Thereafter the Ottomans took Smyrna (1425) and Selonica (1430) and annexed Serbia (1439). But John Hunyadi of Hungary and his Christian allies joined forces with the Karamans, and while Christian forces invaded the Balkans, the Karamans harassed Anatolia. Murad first defeated the Karamans and then stopped the Christian coalition in 1443, forcing it into a truce. Believing that peace was attained, Murad decided to retire and put his son Mehmed in charge. But a new crusade was launched, and Murad returned to command the army. This crusade was defeated at the Battle of Varna in 1444, after which Murad retired again. However, a janissary rebellion against Mehmed brought Murad back. The Ottomans invaded Albania, Serbia, and Kosovo until Murad's death in 1451.

Mehmed II (r. 1451–1481), also known as el-Fatih (the Conqueror), inherited a territory that he transformed into a world empire. A well-educated and ambitious man, he dreamed of world domination. First, the Ottomans put Constantinople under siege and then captured and sacked it in May 1453. Muslims had dreamed of this conquest for centuries. Constantinople was a landmark for both the Christian and Muslim faiths. After its initial plunder, the Ottomans rebuilt and repopulated the city, turning it into their new capital, while the army campaigned to acquire Serbia and the Morea Peloponnesus) in 1459, Trabzon (Trebizond) in 1461, Karaman in 1468, and the Crimea in 1475. During Mehmed's reign, adversaries remained incapable of form-

ing an alliance due to the shock of the Byzantine collapse and their own internal conflicts.

Mehmed also waged long and ruthless campaigns, exhausting his troops, who both admired and hated him. In 1479 the Ottoman army attacked and seized the islands of Levkas, Cephalonia, and Zante in Ionia. Mehmed II's goal was to use this as a base to further attack southern Italy. The following year Otranto was brought under brief Ottoman control (1480–1481), which Christian forces retook following the Conqueror's death. Mehmed II's last expedition was aimed toward eastern Anatolia, but he died a few days after leaving Constantinople/Istanbul. It is reported that his army did not mourn his death and quickly returned to the city.

Bayezid II (r. 1481–1512) became the next sultan, but his brother Cem also fought for power, and their struggle stalled the Ottoman surge. Only after Cem's death in 1495 was Bayezid able to launch serious military campaigns, among them the Lepanto expedition (1499–1503), which is suggested to have transformed the Aegean Sea into an Ottoman "lake."

Ming China's Conflicts—Civil Discord, Japanese Raids, and Campaigns along the Frontiers

The Ming dynasty paid a high price to keep the peace. It controlled domestic unrest but did not end it, failed to eliminate Japanese raiders, and curtailed the scope of its military campaigns across its frontiers. Emperors reacted strongly to challenges to their absolute will but could only

contain and not prevent civil strife. Civil disorders and foreign threats, alone or together, could destabilize the dynasty and were a priority for Ming policy.

The Ming founder, the Hongwu emperor (r. 1368–1398), suspicious of disloyalty in the bureaucracy, controlled it with numerous mass trials, executions, and public beatings, a humiliation for a class that was traditionally exempt from corporal punishment. He gathered information through spying on officials, and he relied on eunuchs to inform him on the condition of the empire. The third Ming emperor, the Yongle emperor (r. 1402–1424), seized power in a bloody civil war and extended the surveillance innovations of the founder to prevent similar civil discord from being used against him.

The Ming dynasty suppressed banditry and the many rebellions to which it led, but these efforts were often unsuccessful. Millennial Buddhism, for example, inspired insurrections in Shandong, a religious movement and a province that equally tended to be centers of rebellion for much of Chinese history. On a more secular plane, dispossessed peasants turned to smuggling or mining; the latter was a restricted occupation to prevent the illicit manufacture of weapons. Silver miners joined rebelling peasants in Fujian in 1448–1449. Other rebellions of miners continued through the end of the century. The Ming defeated its most serious rebellions of non-Chinese, the Yao in Guangxi, in 1464–1466, and of Chinese, in Hubei, in 1465–1476. Banditry and rebellions continued, however.

To stop the raids of Japanese *wokou*, pirates or “dwarfs,” the first Ming emperor sent unsuccessful missions to Japan and finally cut off contact with the country. He suspected that his domestic enemies colluded with the pirates. The Japanese raided freely along the coast, but *wokou* actually included many Chinese of various classes whose smuggling interests coincided with piracy. The first emperor raised both naval and land forces and built coastal fortifications for defense that contained yet did not eliminate piracy.

The Yongle emperor restricted Japan to two tribute missions each decade at the port of Ningbo. He excluded private Chinese participation in this trade, but they ignored these restric-

➤ A SIEGE MENTALITY—REBUILDING THE GREAT WALL

The inability of the early Ming dynasty to end the raids from the pastoralists of the north caused its later emperors to create the fortifications that we recognize today as the Great Wall of China. The shift from an aggressive and mobile policy against the steppe nomads to a defensive one where the Chinese hunkered behind a barrier gave them hope that they could withstand a siege of their country, as the walled city of Beijing had withstood a Mongol siege in the disastrous year of 1449.

In 1474 Yu Zizhun built an earthen wall south of the great bend in the Yellow River that defied the Mongol attack of 1482. Elated by success, the Ming extended the wall. Later, nearer Beijing and to the coast, the Ming strengthened the wall with masonry. Constructing the wall cost the government much in treasure and labor, yet it did not end nomad raids or the need for Chinese retaliation.

The Chinese Ming dynasty never forgot that it had come to power when it overthrew the foreign Mongol Yuan dynasty, and foreigners continued to probe the wall. The Ming knew that their survival depended on the diligence with which they kept the wall equipped with soldiers and in repair.

—Henry J. Antkiewicz

tions where feasible, with the eager cooperation of the Japanese. The Yongle emperor reconstructed the Grand Canal in 1415 to avoid the high seas and piracy.

The Ming founder’s reign name, Hongwu, means “Great Military Conqueror.” He overthrew the Mongol Yuan dynasty and invaded deep into Mongolia. He left a legacy that advised the dynasty not to invade foreign countries but excluded the north, the active threat to China.

The Yongle emperor, a skilled military leader, ignoring the Ming founder’s advice, invaded and incorporated Annam (northern Vietnam). At the same time, he moved the capital north from Nanjing to Beijing, from where he personally led five campaigns against the Mongols, dying during the last one. The Xuanzong emperor (d. 1436) abandoned the occupation of Annam, reverting to the foreign policy of the founding emperor.

In a low point for the empire, the eunuch Wang Zhen badly advised the Zhengtong emperor to accompany a military campaign against the Mongols that led to defeat and the capture of the emperor in 1449 at the Battle of Tumu. Failing to take Beijing, where cannon was first employed in defense, the Mongols found little value in keeping the emperor and returned him to resume valuable tributary relations with the Ming.

Retreating from the steppe, reorganizing the army, and starting to reconstruct a Great Wall occasioned a military revival in the latter part of

the fifteenth century that allowed, for example, the Ming to fight in the northeast alongside the Koreans against the Jurchen.

■ Introduction: The Age of Great Captains and Their Warriors

Given the high incidence of warfare during this 500-year period, it should come as no surprise that the period produced a large number of better-than-average military leaders and even a few brilliant strategists and tacticians. It also witnessed a handful of exceptional battlefield innovators and numerous cohorts of highly skilled and motivated warriors who fought with élan and normally prevailed in battle.

Strategy, which derives from the Greek *strategos* (general), refers to the master plan of war—the “big picture,” as some soldiers call it—whereas tactics, which derives from the Greek *taktikos* (arrangement), refers to the operational use of force on the battlefield in order to achieve a specific objective. Great strategists, such as Nur al-Din and Hulegu, conqueror of Baghdad and founder of the il-khanate of Persia, could also be brilliant battlefield commanders; and charismatic warriors who led their soldiers to victory after victory, such as Chinggis Khan, also did have on occasion an excellent sense of grand strategy, but one talent did not necessarily include the other.

Among the great strategists who were able to articulate a coherent master plan and bring it to a successful conclusion were Pachacuti Inca, Sundiata, Saladin, Mehmed II, and Zhu Yuanzhang. Three of these master strategists are in-

cluded within this topic; the other three, sultans Saladin and Mehmed the Conqueror and Khubilai Khan, are dealt with elsewhere in these pages.

Brilliant battlefield warriors, who often were able to snatch victory from defeat by reason of their training, instincts, and ability to adapt to unexpected challenges or who entered the fray with such careful preparation that victory was almost ensured before the contest began, included Alp Arslan, Godfrey of Bouillon, and Timur-i Leng (Tamerlane).

Great generals who combined both abilities were not as rare as one might imagine. Among these were the aforementioned Chinggis Khan and Nur al-Din, father of the jihadist counter-crusade, several of Chinggis Khan's successors, such as Hulegu; Baybars, the Mamluk sultan whose campaigns set in motion the end of the crusader states in Syria Palestine; and Richard the Lionheart. The latter might seem an unlikely candidate, given his almost suicidal courage on the battlefield and reputation for impulsive brutality, but his grasp of grand strategy as it related to war in both France and the eastern Mediterranean made him a formidable foe whose successes were a wonder to his contemporaries.

Of all the innovators, the greatest might well have been Motecuhzoma Ilhuicamina, who set in motion the Flower Wars of Mexico that, for a

bit more than a century, became a defining element in the culture of central Mexico.

Military groups, or bands of warrior-brothers, who achieved deserved reputations for their esprit and skills were numerous during this half millennium and could be found worldwide. They included, but were not limited to, Turkish *ghazis*; crusaders (and especially the military orders, such as the Knights of the Temple); the various special ranks of warriors in Mesoamerica, such as the Aztec Otomi warriors; Europe's feudal vassals; northern India's Rajputs; Japan's samurai, who managed to meet and defeat Mongol invaders on two occasions; and the Mongol and Turkic followers of Chinggis Khan and his successors and of Timur-i Leng, who devastated much of Central Asia and beyond in the thirteenth and fourteenth centuries.

The latter two groups of warriors were members of what have been termed "courage cultures," and such cultures, which valued highly and even above all else the values and presumed virtues of the warrior, were found throughout the Americas (but not everywhere), in Oceania (but again not everywhere), and certainly in central Asia, home of the Mongols and Turks. Likewise, bands of holy warriors, such as *ghazis* and crusaders, exhibited the characteristics of a courage culture. If one wishes to read an epic in the Western tradition that clearly articulates these values and characteristics, one could do no better than the *Chanson de Roland* (*The Song of Roland*), which was put into its more-or-less final version around 1100. Ironically, it celebrates not only the flawed but eventually successful grand strategy of a mythic Charlemagne but also the tactical stupidity of his nephew Roland. Courage cultures could produce terrible strategists and inept tacticians, even as they also allowed for the emergence of such warrior-geniuses as Chinggis Khan.

—Alfred J. Andrea

Sundiata, Malinke Hero

The famed thirteenth-century Malian emperor and warrior Sundiata (alternately identified as Sunjata, Sun Djata, Mari Jata, and Sologon Keita) represents an interesting case of how West African history has been remembered and reconstructed.

➤ SUNDIATA—THE EPIC ORIGINS OF MALI

The epic poem *Sundiata* is a classic example of African oral history. Passed down by generations of professional oral historians known as griots, this tale became famous in the West when it was recorded and translated by D. T. Niane in 1960. Niane, a Guinean author and playwright, recorded a performance and commentary on the poem by the griot Djeli Mamoudou Kouyate. It tells the story of the rise to power of Sundiata and the founding of the Mali empire in the early thirteenth century.

Like most epic poems, the story of Sundiata combines elements of history, literature, and political propaganda. It served to legitimate rule of the Keita dynasty, of which Sundiata was the first *mansa*, or king. As such, it presents him as a noble and wise ruler who overcame great obstacles in order to become king. For example, Sundiata is born a cripple but is later miraculously healed when he takes hold of a massive iron bar. Later he must form and lead a confederacy of local groups to defeat the evil King Soumaoro Kante.

The story of Sundiata is also notable for the way it presents Islam, which was becoming increasingly prevalent in the West African savanna region during the period. In particular, Sundiata is often represented as a Muslim, while his nemesis, Soumaoro, is presented as a pagan sorcerer-king.

—Jonathan Reynolds

Most of the sources available regarding Sundiata take the form of oral epics recounted by what are typically identified as griots. There are many versions of the Sundiata Epic, though the best known is a version narrated to the Malian scholar D. T. Niane by the griot Djeli Mamoudou Kouyate in the 1950s. Niane published a translation in French and later English. Thus ironically, this version of the oral history has become something of a standard text by virtue of having been written down. The oral version of Sundiata's rise to power was initially produced and maintained to legitimate his dynasty's power over the empire he created. However, in the centuries since the decline of the Mali empire, it has become a blend of legend, history, and entertainment. This is an excellent example of how oral history blurs the line between history and literature.

In broad terms, the *Sundiata* Epic outlines what we believe to be historical events. *Sundiata* clearly pulled together a coalition of forces from around the upper Niger River valley to defeat an unpopular ruler known as Soumaro at the Battle of Krina (ca. 1235). In so doing he created a powerful state, with a number of local kings handing sovereignty over to him, identifying him as the Mansa, or “King over Kings.” Many of these historical elements are corroborated by other sources, such as in an Arabic history authored by Ibn Khaldun.

Many specific elements of the story are clearly symbolic. *Sundiata*, for example, is born a cripple, unable to walk. One day in his early teens, he requests that a huge iron bar be made by a group of blacksmiths. He uses the iron bar to pull himself upright and is miraculously healed of his disability, bending the bar into the shape of a great longbow in the process. This is usually interpreted as symbolic of how *Sundiata*’s command of technology, nurturing of economic productivity, and military prowess would guarantee his success as a ruler.

Another key theme that runs through the epic is *Sundiata*’s religious legitimacy. Reflecting the dominance of Islam in the region’s cities, when in urban settings *Sundiata* dresses “in the robes of a Muslim King.” *Sundiata* also interacts frequently with Muslim merchants. But when traveling outside of the cities or when leading his army, he appears dressed as a hunter, like the “First Kings of Mali,” reflecting the ongoing practice of indigenous religion as found in the rural areas. The *Epic of Sundiata* thus reflects the careful balance that the region’s kings had to strike between an increasingly influential urban Muslim population and the empire’s still predominantly traditional rural populace.

Alp Arslan—The Brave Lion of Manzikert

Alp Arslan (ca. 1029–1072) was born in the region of Khwarezm in northern Iran. He assumed the name Muhammad ibn Daud Chagribeg upon his conversion to Islam. He was subsequently accorded the honorific name Alp Arslan (Valiant Lion) for his military prowess and valor in battle. The second sultan of the Seljuk dynasty, he was the great-nephew of the eponymous founder of the dynasty. Along with his uncle Tughril Beg (r. 1055–1063) and son Malik Shah (r. 1072–1092), Alp Arslan created, organized, and brought to the heights of power the Great Seljuk sultanate.

Alp Arslan became *wali* (governor) of Khurasan, a northeastern region of Persia, succeeding his father in 1059, and fought the Turkmens, a Turkish tribe located in present-day Turkmenistan, Afghanistan, and Iran. Following the death of Tughril Beg, who in 1055 had established the Seljuk sultanate in Baghdad, he fought his brother and uncle for the office, winning out in 1064, thereby becoming the Great Seljuk and the sultan of Persia, Oxus, and Iraq.

Preferring war to governmental organization, Alp Arslan was fortunate to be assisted by the justly celebrated and talented *wazir* (prime minister) Nizam al-Mulk (active 1063–1092), who was instrumental in reorganizing the empire. On his part, Alp Arslan reformed the army, using soldiers from nomadic Turkish tribes and drawing on the resources of the sedentary Iranian and Arab populations. This allowed him to field a huge standing army without depending on tribute from conquests to pay his soldiery. He not only had enough food for his military campaigns but also collected taxes from traders and merchants that made it possible for him to wage long campaigns.

After a brief period of time, Alp Arslan declared his son Malik Shah I as successor in order to free himself to start an aggressive campaign of plunder against the Byzantines in the region of Cappadocia in south-central Anatolia, where he intended to take the capital Caesarea, well known for the immense potential booty in St. Basil’s church. In 1067 Turkish armies sacked the city.

In 1068 Emperor Romanus IV Diogenes led his troops into Armenian Cilicia, located in south-eastern Anatolia, in order to fight the Seljuks there and farther south in Syria. After two years of campaigning, the emperor fought the Turks to a stalemate in 1170, and Alp Arslan, who seems not to have had a desire to conquer all of Anatolia but instead had designs on conquests farther afield, removed his army and crossed the Euphrates into northern Syria.

The next year, however, the Byzantine emperor took the offensive in the Armenian regions of far eastern Anatolia. There, at Manzikert on August 26, 1071, Byzantine and Turkish forces clashed after Romanus rejected the sultan's proposed terms of peace. The result was desertion from the Byzantine army of a crucial cadre of Cuman Turkish mercenaries and a crushing Byzantine defeat. Emperor Romanus was captured and brought to the presence of Alp Arslan. According to tradition, the following dialogue took place:

Alp Arslan: "What would you do if I were brought before you as a prisoner?"

Romanus: "Perhaps I'd kill you, or exhibit you in the streets of Constantinople."

Alp Arslan: "My punishment is far heavier. I forgive you, and set you free."

In point of fact, Alp Arslan's leniency flowed from his desire to reach an accord with Byzantium, which would free him to continue his drive to assert his supremacy over Islam in the Caucasus, throughout western Central and Southwest Asia, and as far as Egypt. Ultimately he added Georgia and Armenia to a vast and growing realm that reached beyond the Pamirs in the east and as far south as Oman. Although he asserted his hegemony over much of Syria-Palestine, Seljuk power never extended to Egypt.

When Romanus returned to Constantinople he was deposed, blinded (a normal practice used both by the Byzantines and the Muslims), and exiled to the island of Prote in the Sea of Marmara, where he died after a short time.

A year later, Alp Arslan undertook a new military campaign in Turkestan against the rebel governor Yussuf al-Harezmi. In victory, however,

➤ HOW DECISIVE WAS THE BATTLE OF MANZIKERT?

Many historians, such as Edward Gibbon, have considered the Battle of Manzikert (in 1071) as the effective date of the beginning of the end of the Byzantine empire. It is true that the conquest of Constantinople would only be achieved by the Ottoman sultan Mehmed II in 1453, but if we consider the territorial decadence of the empire after Manzikert or after the conquest of the city by the crusaders of the Fourth Crusade in 1204, we are able to recognize how the defeat at the hands of Alp Arslan was of considerable relevance.

It was important also because before this fateful date, the Byzantines during the Macedonian dynasty (867–1056) were able to promote a cultural and military renaissance, with the reconquest of many regions dominated by the Muslims since their invasions of the seventh century. During the reigns of John I Tzimiskes (r. 969–976) and Basil II (r. 976–1025), for example, Byzantine armies were able to reconquer various cities and territories in Syria. The defeat at Manzikert, regardless of its almost accidental nature, placed an end to this historical period of retrenchment and, moreover, firmly secured the eastern regions of Anatolia for the Seljuks. Beyond that, it initiated a centuries-long process whereby Anatolia, the heartland of the Byzantine empire and the source for much of its human and economic resources, was slowly transformed into a Turkish land. Finally, the shock of Manzikert opened the Byzantines to the idea of seeking Western aid against the Seljuk menace, which ultimately led to the First Crusade and all that followed from that eventful expedition. Arguably, without the events of 1071, the events of 1204 would not have occurred.

—Marco Demichelis

Alp Arslan met death when the captured Yussuf al-Harezmi struck him a mortal blow with a knife. Alp Arslan died on November 25, 1072, four days after receiving his wound. Malik Shah, his son, inherited the role of sultan and held it until 1092.

Godfrey of Bouillon—Defender of the Holy Sepulcher

Godfrey de Bouillon (1058–1100), French duke of Lower Lorraine and one of the most important leaders of the First Crusade, set out for the Holy Land in 1096 with his brother Baldwin in response to Pope Urban II's calling of the crusade. Godfrey's early commitment to crusading

was perhaps best demonstrated by his mortgaging his duchy to pay for the thousands of knights and foot soldiers he brought with him, primarily Germans, Flemings, and Walloons.

Godfrey was the first crusade leader to reach Constantinople and meet with Emperor Alexius I Comnenus, which meant that he was the first of the crusaders to deal with Alexius's unexpected demand of an oath of allegiance. As a member of the Western nobility, Godfrey and the other leaders of the crusade who followed him were uncomfortable with taking an oath to an Eastern emperor. Yet Godfrey realized that good relations with the emperor were necessary. As a result, he set the pattern for those who followed by taking an oath that in exchange for proper Byzantine support for the crusaders' efforts, the crusaders would return all captured lands that had once been under the authority of the Byzantine empire to the control of Alexius.

While Godfrey was active in the early crusader conquests of Nicaea and Antioch, he is most noteworthy for his efforts during the siege and capture of Jerusalem in 1099. His troops were the first to break through the city walls and reportedly began a massacre of the Jewish and Muslim inhabitants. During the massacre, Godfrey allegedly demonstrated his piety when he stripped off his armor and cast down his arms as he made his way barefoot through the mayhem to pray in the Church of the Holy Sepulcher in fulfillment of his crusading vow. In the wake of the conquest of Jerusalem, Godfrey was chosen by the crusaders as ruler of the holy city. The support that Godfrey received from the other leaders for his new position was quite an accomplishment in light of the earlier rivalries that existed among the crusading princes as well as between the lay lords and the clergy. Yet Godfrey had fought well in the conquest of Jerusalem and also had the support of his powerful brother Baldwin, who by then controlled the county of Edessa. Although Godfrey declined the title of king of Jerusalem, even if he ultimately held an equal authority, he did accept the title of Defender of the Holy Sepulcher.

During Godfrey's brief reign he expanded his authority as well as the overall successes of the crusaders by bringing several surrounding towns under his control, including Ascalon in 1099. He

► RAYMOND D'AGUILIERS—THE SELECTION OF GODFREY OF BOUILLON AS DEFENDER OF THE HOLY SEPULCHER

Accordingly, after six or seven days the princes solemnly began to consider the matter of choosing a ruler, who, assuming charge of all matters, should collect the tributes of the region, to whom the peasants of the land could turn, and who would see to it that the land was not further devastated. While this was taking place, some of the clergy assembled and said to the princes, "We approve your election, but if you proceed rightly and properly, you will first choose a spiritual vicar, as eternal matters come before temporal; after this, a ruler to preside over secular matters. Otherwise, we shall hold invalid whatever you do." The princes were exceedingly angered when they heard this and proceeded the more quickly with the election. . . . The princes, disregarding admonition and opposition, urged the Count of St. Gilles to accept the kingdom. But he said that he abhorred the name of king in that city, though he would consent to have others accept it. For this reason they together chose the Duke [Godfrey of Bouillon] and placed him in charge of the Sepulchre of the Lord.

also rebuilt the nearby city of Jaffa, making it the primary port of arrival for crusaders and other pilgrims on their way to Jerusalem. Among his final acts, he made an agreement with the Venetians to besiege Acre but took sick and died in July 1100 before he could take part in the siege. Godfrey was succeeded by his brother Baldwin I (r. 1100–1118) who, unlike Godfrey, was willing to accept the title of king of Jerusalem.

Godfrey was buried in the Church of the Holy Sepulcher, where his tomb remained until it was destroyed in the nineteenth century.

Two Parallel and Divergent Jihadists—Nur al-Din and Baybars

With the launching of the crusades by Pope Urban II (r. 1088–1099) at the Council of Clermont in 1095, Muslim hegemony over the lands of the

Middle East was thrown into jeopardy. However, out of this turmoil and strife arose two great Turkish champions of Islamic orthodoxy: the *atabeg* (military commander and vicegerent) of Aleppo and Mosul Nur al-Din (r. 1146–1174) and the Mamluk (freed slave-soldier) Sultan Baybars I al-Bunduqdari (r. 1260–1277). While the careers of both show similar approaches to the military threats of their times, both leaders also employed different tactics, with each earning lasting fame and respect.

During the early twelfth century, Frankish authority in the Levant was ascendant, and it is into this milieu that al-Malik al-Adil Nur al-Din Abu al-Qasim Mahmud Ibn Imad al-Din Zangi, better known as Nur al-Din, was born in 1118. With the assassination of his father, Imad al-Din Zangi, in 1146, the Muslim response to the Franks was placed in jeopardy. In keeping with custom, Zangi's two surviving sons, Saif al-Din Ghazi (r. 1146–1149) and Nur al-Din, each received portions of their father's patrimonial estate. Taking advantage of the political instability, Raymond of Poitiers, Prince of Antioch (r. 1136–1149), launched a series of raids against the two Zangid rulers. However, both brothers united and repelled the Franks.

It is at this early period that Nur al-Din began to distinguish himself as a pragmatic ruler, entering into agreements and partnerships with his elder brother to present a united front to the Franks. This policy proved to be especially useful, but his brother passed away a mere three years after their father. On the other side, the Franks were unable to unite and dislodge the now sole Zangid ruler from his territories. Joscelin II of Edessa (d. 1159) tried to reconquer Edessa, which was lost to Nur al-Din's father in 1144. However, despite the assistance of the native Armenian Christian population, his attempt failed, and the Armenians were forced by Nur al-Din to evacuate the town.

Recognizing the weak Muslim position but also the weakness of the Frankish position, Nur al-Din sought to gain strategic alliances—characterized by the historian P. M. Holt as the “Syrian federation”—with various Muslim governors and military commanders across the region. Foremost among them was the strategic city of Damascus. In 1147, through a series of agreements with Muin

➤ TWO CROWNING ACHIEVEMENTS—THE OCCUPATIONS OF DAMASCUS AND ANTIOCH

The occupations of the great cities of Damascus by Amir Nur al-Din and of Antioch by Sultan Baybars I al-Bunduqdari reveal very different strategies employed by these two great jihadists of the crusader period. In the case of Damascus, Nur al-Din needed the city as the linchpin for his Syrian federation. With Frankish control of the coastal regions and Jerusalem, the city's location astride the route from the grain-rich areas of Hawran and the Biqa Valley made its control essential to the Muslim resistance. Under the rule of the regent Amir Muin al-Din Unur (r. 1140–1149) of the Burid dynasty (1104–1154), there was cooperation between Damascus and Nur al-Din, but by 1150 the situation had changed greatly. The new ruler, Mujir al-Din, did not want to lose his autonomy and entered into agreements with the Frankish kingdom of Jerusalem. Thus, Nur al-Din, in preservation of both his own position and the grand Syrian federation, laid siege to a Muslim city and conquered it in 1154. The city was refortified and again became a military, cultural, and political capital.

Roughly a century later, the sultan Baybars laid siege to the city of Antioch (present-day Antakiya in Turkey). Antioch had fallen to the Frankish armies of the First Crusade in 1098, and territory surrounding the city comprised the principality of Antioch (1098–1268). By the mid-thirteenth century the principality was reduced to the status of a vassalage of the Armenian kingdom of Cilicia (1078–1375). With the other crusader states in general disarray, the real threat to Muslim hegemony came from the invading Mongols, whom Baybars routed at Ayn Jalut in 1260 and again in 1277 at Elbistan. However, the prince of Antioch, under orders from the Armenians, entered into agreements with the Mongols, necessitating the Mamluk sultan's attack and capture of it in 1268. Unlike Damascus, which held strategic value to Nur al-Din, Antioch's Orontes River had silted up, preventing large ships from docking in the city as they had in antiquity. Seeing the city as more of a liability, Baybars reduced it to rubble and sold its Frankish and Eastern Christian populations into slavery. Its removal opened up the coastal region to Mamluk control and effectively ended Frankish authority in Syria.

—*Rasheed Hosein*

al-Din Unur (r. 1140–1149), the governor of Damascus, the Zangid ruler was able to bring the city into his Syrian federation. In response, Conrad III of Germany (r. 1138–1152) and Louis VII of France (r. 1137–1180) led the armies of the Second Crusade (1147–1149) against Damascus in July 1148 but were easily repelled after a siege of only four days. In 1149 Muin al-Din Unur died, and his successor Mujir al-Din Aybek (d. 1169) did not accept Nur al-Din's leadership. However, Nur al-Din earned the support of the city and ousted Mujir al-Din in 1154, leaving the Zangid as the unquestioned leader of the Muslim response to the Franks. Damascus, for the first time since the Umayyad dynasty (661–750), was the capital of a major unified Muslim territory.

The legacy that Nur al-Din presents to posterity is one of an urbane and quietly effective warrior and a sincerely pious Sunni Muslim. He restored the dignity of Damascus as a major capital. His decisive military actions stemmed the threat of the Second Crusade to the Muslim centers of the Syrian littoral. While he was not averse to using force and even calculated brutality to obtain support for his Syrian federation, his first choice was always diplomacy, and he used his diplomatic skills to great advantage. Nur al-Din also respected the Frankish crusaders and colonists. While he clearly viewed them as a dangerous threat to Islam, those who earned his respect were honored, and those who broke faith were given no quarter. The best example of this is his refusal to attack the Franks upon the death of King Baldwin III of Jerusalem (r. 1143–1162), whom he held in high regard. The Franks did not offer Nur al-Din's widow the same respect upon his death in 1174.

In contrast, the future Mamluk ruler al-Malik al-Zahir Rukn al-Din al-Salihi, known to history as Baybars I, was born among the seminomadic Turkic peoples of the Kipchak steppes around 1223. Purchased by the last great Ayyubid sultan al-Salih Ayyub (r. 1240–1249), he was given to the Turkish officer Aydakin Bundukdar. Baybars was said to have extraordinary physical features, being abnormally tall and blond and possessing a curious white spot in one of his eyes. These features caused Aydakin to later sell the young slave at a steeply reduced price, something that shamed and galled the future ruler.

Baybars enters the historical records on the register of prisoners at al-Karak, where he was incarcerated along with al-Salih Ayyub in 1239. However, after Baybars earned his release, he began to distinguish himself in combat on the Syrian frontier. These military successes culminated in his decisive command of Mamluk forces at the Battle of Mansura (1250), which led to the complete rout of Frankish forces and the capture of the French king Louis IX (r. 1226–1270). A decade later and commanding the Mamluk vanguard forces, Baybars led the defense of Egypt against the Mongol threat. At Ayn Jalut in September 1260, the Mamluks routed the seeming invincible Mongols, sparing Egypt and much of Syria from Mongol depredations, unlike unfortunate Iran and Iraq.

Baybars proved a ruthless politician, being linked conclusively with the murders of the Ayyubid ruler Turan-Shah (d. 1250) and the Mamluk ruler Qutuz (d. 1260). Once in power in Egypt, Baybars demonstrated this same ruthless resolve in securing his other territories. With the presence of both Mongols and Franks in the littoral, he took the offensive and attacked the Frankish stronghold of Acre in 1263. While this initial attack was unsuccessful, his subsequent battles against crusader outposts yielded more favorable results. By 1268 he reduced the great city of Antioch to rubble, selling its captured population into slavery. However, the Mongol threat proved more pressing, and the sultan turned his attentions to that threat, perhaps passing up the opportunity to totally remove the Franks from the Near East.

Territory conquered under Baybars received extensive infrastructural upgrades with an eye to integration and defense. In attacking his foes, the sultan systematically destroyed Frankish defenses, forcing them to expend energy that might otherwise be directed against him. Internally, Baybars contributed extensive revenues toward upgrading existing military fortifications and the construction of naval vessels. However, arguably the most important infrastructural upgrade was the development of a military postal system that could deliver letters between Damascus and Cairo in roughly four days. In addition to his military building, Baybars was a consummate civilian builder, establishing many important mosques

in Cairo and even renovating the Dome of the Rock on the Temple Mount in Jerusalem. Death came to Baybars in the same way as had power. He imbibed some poison meant for another while in Damascus in early July 1277. He was laid to rest in the library complex that he established in that city.

Baybars's death left unfinished his goal of totally evicting the Franks from the Levant, but because of his military successes against Franks and Mongols alike, a successor, al-Ashraf Kahil, completed the task in 1291.

Baybars's popularity, especially in Syria, lives on, despite his bloody rise to power and somewhat bloodthirsty rule. His life was immortalized in the *Sirah al-Sultan Baybars* (*The Life of the Sultan Baybars*). This source is more a work of heroic and romantic deeds than a straightforward historical source, but it remains an immensely popular work. His military, state-building, and political exploits, in addition to this romanticism, have kept his image alive in the popular imagination of Levantine Arabs and Egyptians today. Key among these attributes were his exploits as a jihadist, which hold special resonance to Middle Eastern Muslims today. The state that he was instrumental in founding and its concomitant instruments of legitimation continued to prosper for almost 300 years until its ending by the Ottomans in 1517.

Crusader and Jihadist Atrocities and Acts of Chivalry

As a movement with religious militancy at its core, the crusades unsurprisingly produced a considerable number of atrocities but also acts of chivalry. Indeed, one person's atrocity might be another's act of chivalry. Such was the case with the slaughter of Jews by some of the earliest crusaders making their way through Europe to the Holy Land in 1096. While likely acting out of a variety of motives, at least some of the crusaders reasoned that since they were going to fight the infidel in the Holy Land, they would please God by eliminating the infidel living in their midst, by forced baptism that too often turned into murder. Contemporary Christians were divided over the event, with some condemning it and others approving.

Some of the early battles in the East produced stories of crusaders eating the dead bodies of their fallen Muslim opponents. The most gruesome accounts focused on events at the sieges of Antioch and Maarra in 1098. Christian chroniclers reported specific incidents that included graphic descriptions of filleting dead Muslims, boiling their bodies in pots, and impaling their children on grilling spits. While starvation was reported as the chief cause of cannibalism during the prolonged siege of Antioch, some crusaders also appreciated the terrifying shock value that such actions had on their enemy. The historian Guibert of Nogent notes that one group of crusaders at Maarra publicly roasted the bodies of dead Muslims in full view of their opponents.

Added to the often sensationalized but generally true tales of cannibalism were accounts of the mass slaughter of the inhabitants of Jerusalem after the crusaders' capture of the city in 1099. Recent estimates put the figure at around 3,000 slain. The account of Ibn al-Qalanisi also mentions a particularly troubling incident during the capture in which a congregation of Jews

perished when the synagogue where they were seeking refuge was burned down. While such an event may not seem out of place in light of earlier attacks on Jews in Europe, some historians have noted that it is a myth that the crusaders specifically targeted the Jews of Jerusalem in 1099.

Controversial acts committed by the crusaders continued throughout the crusading period. Among the most notable was King Richard the Lionheart's slaughter of thousands of Muslim captives at Acre in 1191. Also, the Byzantine historian Nicetas Choniates recorded a particularly brutal rampage through Constantinople by crusaders following their capture of the city in 1204. Many scholars now tend to discount Nicetas's lurid account and argue that the massacre was not as great as many have traditionally thought. Indeed, there might not have even been a massacre. Yet as with the slaughter of the Jews during the First Crusade, the successful conquest of Constantinople was interpreted in some crusader accounts as evidence of God's favor, while other crusader accounts are silent on the issue, suggesting ambivalence or even a sense of shame over the city's desecration. Perhaps the most hostile Western source on the sack of Constantinople was written in 1205 by Pope Innocent III, who described the city's despoliation with language that equals Nicetas Choniates's hyperbole.

The crusaders' Muslim opponents were also accused of atrocities. Perhaps the most well known of these was committed by Saladin. Following his crushing victory over Christian forces at the Battle of Hattin in 1187, he carried out a mass execution of captured members of the Knights Templar and Hospitalers. While he spared the life of the valuable grand master of the Temple, whom he hoped to ransom later, all the other members of the military orders were beheaded by Sufis to ensure that Saladin would not have to face them in later battles. Numerous atrocities were also attributed to the thirteenth-century Mamluk leader Baybars, a man known for his cruelty to Christians and Muslims alike. In 1268 Baybars's forces captured Antioch and razed the city, killing or enslaving the mostly Christian population. Likewise, on occasions when Bay-

➤ KILLING PRISONERS OF WAR AT HATTIN AND ACRE

Saladin orders the execution of Christian prisoners:

On the morning of Monday two days after the victory [Battle of Hattin July 4, 1187], the Sultan sought out the Templars and Hospitalers who had been captured and said: "I shall purify the land of these two impure races." . . . He ordered that they should be beheaded, choosing to have them dead rather than in prison. With him was a whole band of scholars and sufis [Muslim mystics] and a certain number of devout men and ascetics; each begged to be allowed to kill one of them, and drew his sword and rolled back his sleeve.

Imad ad-Din al-Isfahani, *al-Fath al-qussi fi l-fath al-qudsi* ["Ciceronian Eloquence on the Conquest of the Holy City"], translated into Italian by Francesco Gabrieli, *Arab Historians of the Crusades*, translated into English by E. J. Costello (Berkeley and Los Angeles: University of California Press, 1969), 138.

King Richard orders the execution of Muslim prisoners:

However, upon that day, the pagans neither produced the Holy Cross [which had been captured at Hattin and was demanded back as part of their ransom], nor the Christian captives, nor yet the money which they had promised for the safety of their life and limbs: in consequence of which failure, all those pagans were sentenced to undergo capital punishment. . . . [T]he King of England caused all the pagans who belonged to him from the capture of Acre to be led out before the army of Saladin, and their heads to be struck off in the presence of all. . . . The number of the pagans thus slain was five thousand, all of whom the Christians disemboweled, and found much gold and silver in their entrails, while they preserved their gall for medical purposes.

Roger de Hoveden, *The Annals of Roger de Hoveden Comprising the History of England and of Other Countries of Europe from A.D. 732 to A.D. 1201*, Vol. 2, translated by Henry T. Riley (London: H. G. Bohn, 1853), 219–220.

bars initially failed to take strategic crusader castles, it was common for him to take out his rage on the local peasant population.

In contrast to these atrocities, many acts of chivalry took place during the crusades. In fact, it should be understood that the foundation of our understandings of chivalry originated with the ideals embraced by the knights of the crusading era. Although the crusades were violent expeditions, there existed a code of behavior, whether faithfully observed or otherwise, that was supposed to guide the knight's actions. The knight who lived according to chivalric values was courteous to women, defended the weak, and was loyal to king and God. Perhaps most important was the understanding that a knight was to show bravery in battle and mercy to a vanquished enemy.

King Louis IX of France provides perhaps the best example of a chivalric crusader-warrior.

Louis, who was proclaimed St. Louis in 1297 only 27 years after his death, was the architect and leader of the Seventh and Eighth crusades. Accounts of Louis IX's efforts during the crusades are full of instances of bravery and sacrifice. In one case the king reportedly took the risk of riding into the front ranks of the enemy in a successful effort to save his brother. In another instance, although sick from dysentery and subject to numerous fainting spells, Louis refused to abandon his troops during a fierce battle that led to his capture and imprisonment in 1250 during the Seventh Crusade. According to the account of Jean de Joinville, the future saint had access to a galley that would have allowed him to escape, but he chose to remain in danger rather than desert his suffering warriors.

Other noteworthy crusaders who earned reputations for chivalry include Godfrey de Bouillon and Richard the Lionheart. Godfrey's deeds

were eventually elevated to nearly mythic proportions, as he was celebrated both in the many histories of the First Crusade and later *chansons de geste* (songs of heroic deeds). Among the many deeds of valor attributed to Godfrey is the story that during the siege of Antioch, he led a band of only 12 knights who fought so ferociously that they forced the retreat of 150 Turks. In addition to his bravery in battle, Godfrey's religious devotion was also demonstrated by his refusal to accept the title of king of Jerusalem. He reportedly did this out of respect for the holiness of the city and considered such a proposal unseemly.

Like Godfrey, King Richard I was praised for his valor in combat. His military success during the Third Crusade was in several instances known to have inspired the otherwise demoralized crusaders. Richard's victories over Muslim forces at Arsuf and Jaffa proved that the seemingly invincible Saladin could be defeated. It was also reported that at Jaffa, a key port city, Richard personally led charges that rallied the crusaders to victory over a numerically superior Muslim force. The king was also occasionally hailed for his mercy to captured enemies. In one such instance in 1192, Richard ordered the execution of a number of captured Muslim raiders who were harassing Christian pilgrims in Palestine. Yet when Saladin's herald was discovered among the prisoners, Richard spared his life.

No other Muslim participant gets as much credit for acts of chivalry during the crusades as Saladin. The sultan's biographer Beha ad-Din records one instance in which the three-month-old child of a Christian woman in the crusaders' camp was kidnapped by Muslim slavers, who brought the child to Saladin's camp. The woman risked her life to secure an audience with the sultan and beg for her child back. Saladin, reportedly brought to tears by the woman's anguish, ordered that the child be found and returned to its mother, who was then given safe passage to the crusaders' camp.

Saladin was equally renowned for his dealings with his Christian opponents. Among the many chivalrous deeds attributed to him include an instance in which the victorious sultan offered water as a sign of mercy to Guy de Lusignan, the defeated king of Jerusalem. Sources also

tell us that upon hearing the news of Richard the Lionheart's sickness, Saladin offered the services of his physicians to the ailing crusader king.

Hulegu—Conqueror of Baghdad

Mongol hostilities resumed in the Near East in 1256 under the late Chinggis Khan's grandson, Hulegu. Years of succession problems in Karakorum had disrupted the momentum of Mongol conquests, and the western Eurasian khans were anxious to spread Mongol hegemony across the Euphrates and into Syria and Egypt. The new great khan Mangu rewarded Hulegu's fidelity in the succession fight with newly conquered lands centered in Persia and Khorasan and then charged him with subjugating the Abbasid caliph in Baghdad and the destruction of the last remaining great power in the Near East, the Mamluk sultanate in Cairo. As a prelude to his attack on Syria and Egypt, Hulegu decided to isolate the two smaller independent Islamic powers that stood on either side of Syria's eastern flank, the Ismaili Order of Assassins in the north and the Abbasid caliphate in the south.

Drawing on assistance from troops from the Golden Horde in Russia, Hulegu Khan entered Persia in 1256 with an army of over 100,000 men and a very substantial siege train manned by 1,000 crews of Chinese engineers. The Ismaili mountain fortresses were his first objective. As the Mongol military machine reduced castles in Mazanderan, Meimundez, and Alamut, the last Master of the Assassins, Rukn ad-Din, threw himself on the mercy of Mangu Khan, journeying to

the court in Karakorum only to be denied an audience. Rukn ad-Din was murdered on the way back to Persia, kicked to death by his escorts. By February 1257 over 100 of the Ismailis' castles had been demolished, their inhabitants, including women and children, slaughtered.

Hulegu next sent letters to the caliph of Baghdad, al-Mustasim Billah, ordering him to dismantle his walls and come to the khan's tent and swear allegiance. Al-Mustasim refused, replying that many armies had failed against Baghdad in the past. Unfortunately, centuries of neglect had left the city's walls in disrepair, and its garrison of some 50,000 men was ill-equipped and poorly trained. The caliph also failed to heed the warnings of his generals to conscript more soldiers. And even though his position as the Abbasid caliph gave him the authority to summon assistance from the whole of Islam, the only two regional powers left, Syria and Egypt, refused to assist him. Finally recognizing the gravity of his situation, the caliph ordered the walls repaired only one day before the Mongols arrived.

His patience at an end, Hulegu commanded the Mongol army to converge in four columns on Baghdad. In response, al-Mustasim ordered a force of 20,000 cavalry to delay the steppe warriors' advance. As the Muslim army approached, the Mongols broke the dikes on the banks of the Tigris River, flooding the garrison's camp and cutting off the army's line of retreat. Only a few Muslim warriors survived the flood and the engagement with Hulegu's vanguard, returning to the city with the throngs of refugees.

Digging a ditch and rampart around Baghdad's walls, Hulegu ordered the bombardment to commence on January 30, 1258. After seven days of uninterrupted barrage with the trunks of palm trees, foundation stones, and shot, the caliph offered his submission, but the khan would accept nothing short of unconditional surrender. On the morning of February 6 the Mongols stormed and captured the entire eastern wall.

Over the next seven days the city was pillaged, and its libraries, madrasas (schools), mosques, and palaces burned. The garrison was put to the sword, and according to one account, the caliph and his three sons were sewn up in Persian carpets and trampled to death under the hooves of Mongol horses. Baghdad, once the cul-

THIRTEENTH-CENTURY MONGOL CAMPAIGNS, BATTLES, AND DIPLOMATIC MISSIONS AFTER CHINGGIS KHAN'S DEATH

- 1232—Siege of Kaifeng

Zhu Yuanzhang—From Impoverished Peasant to First Ming Emperor

Zhu Yuanzhang, who ascended the imperial throne of China on January 23, 1368, as the Hongwu (Vast Military Power) emperor, rose from the ranks of the peasantry to found the Ming dynasty (1368–1644) after leading a popular rebellion against the Mongol Yuan dynasty (1279–1368). Only two emperors share the distinction of rising from the peasantry to the imperial yellow: Liu Bang, who became Han Gaodi (r. 206–195 BCE), founder of the Han dynasty, and Zhu Yuanzhang. Both accomplished this feat at the head of a rebel army.

Born on October 21, 1328, Zhu Yuanzhang was the son of an itinerant laborer. In 1344 famine claimed his parents and two elder brothers, and Zhu joined a Buddhist monastery to avoid a similar fate. Even this was not sufficient for him to escape hunger, so he took to the roads as an itinerant monk with begging bowl. Three years of wandering brought him into contact with a number of radical religious sects that preached rebellion against the hated Mongol overlords of China. After returning to his monastery, he was forced to leave for a life of renewed wandering when the monastery was destroyed by Mongol militia. Homeless again, he joined one of the many factions of the Red Turbans in 1352, a rebel group that drew heavily on the teachings of Manichaeism, Daoism, and the cult of the Maitreya Buddha, the Buddha of the future who would descend from his abode in the Tushita Heaven to usher in a new age. Zhu rose quickly through the

ranks of the rebel band and in 1355 took command. The following year his army captured the southern city of Nanjing, which became his base. When the leader of the Red Turbans died under mysterious circumstances in 1367 while he was Zhu's guest, Zhu declared his own imperial ambitions. As Zhu's army marched north, the last Yuan emperor, Toghon Temur (r. 1333–1368), fled the capital of Dadu (in present-day Beijing) for Mongolia. Zhu razed Dadu; declared himself founder of a new imperial dynasty, the Ming (Brightness); assumed the imperial temple name of Taizu; and proclaimed the Hongwu Era. He then returned to Nanjing, which he transformed into his capital. In 1370 he drove the Mongols farther north, and by 1387 he had regained and reunited all of China.

Because China continued to be threatened with Mongol invasions, Ming Taizu believed that China had to maintain a strong military presence along its frontier, especially its northern border with Mongolia. He created a standing army of more than 2 million soldiers, which he used in expeditions into Central and Southeast Asia, but this massive army was largely for defensive purposes and internal security. No serious attempt was made to invade and conquer Mongolia. His reliance on the army to gain and then defend his empire led him to modify the traditional Confucian principle that soldiers are vastly inferior to scholars because military violence represents a loss of decorum and rationality. His increased attention to the well-being of the army greatly raised the military's prestige. At the same time he tried, with some success, to make the army fairly self-supporting by settling soldiers and their families on lands that they were given to farm.

His ventures into militarism were balanced by diplomatic forays, with Chinese envoys demanding tributary obeisance from such states as Korea, Japan, Tibet, Annam (northern Vietnam), Champa (southern Vietnam), Borneo, Java, Sumatra, and even Coromandel on the eastern coast of India.

At home Zhu concentrated power into his own hands, abolishing the post of prime minister in 1380. As an autocrat he strengthened agriculture; instituted a successful campaign to reforest large areas of China; reformed landhold-

ing to the benefit of peasants; outlawed private slavery; improved China's infrastructure, especially its canals and dikes; and reinstituted the civil service examination system, which tested candidates on their knowledge of Confucian literary and philosophical texts. On the less-positive side, his misuse of government-issued paper money caused massive inflation. By 1425 paper money had dropped to 1/70th of its initial value, and the state had to return to copper coinage. He also conducted massive purges, killing off or disgracing numerous potential rivals, many of whom were former supporters. When he died in June 1398 in the 31st year of his reign, he was followed to the grave by 38 concubines who were immolated along with him in conformity to the traditions of his Mongol predecessors.

Motecuhtzoma Ilhuicamina— The Heaven Shooter

The Mexica (Aztecs) had a series of a dozen rulers, the *buey tlahtoani*, from the time of the foundation of their capital, Tenochtitlan, until the arrival of the Spaniards. One of the most famous was Motecuhtzoma Ilhuicamina, popularly known as Montezuma I (r. ca. 1440–1468). His name translates as “He who scowls in lordly anger, he who shoots an arrow into the sky.” The last Mexica emperor was also named Motecuhtzoma but with the sobriquet of Xocoyotzin (The Younger).

The Mexica chose their rulers from the male members of a single ruling family. Thus, the leadership more frequently passed from brother to brother or uncle to nephew than from father to son. In his case, Motecuhtzoma Ilhuicamina succeeded his uncle Iztcoatl (Obsidian Snake) under whom he had served as a military leader. Iztcoatl governed along with his brother Tlacaelel, who was an adviser and strategist and second-in-command, holding the title of *cibua-coatl* (female snake). Under Iztcoatl, the Mexica gained their independence from the city-state of Azcapotzalco, a rival in the Valley of Mexico.

THE CONCEPTION OF MOTECUHTZOMA ILHUICAMINA

Mexica history provides some very colorful stories regarding the birth and youth of the men who would become emperors. One of the most colorful, and in some ways even romantic, was the story of the conception of the great emperor Motecuhtzoma Ilhuicamina.

The emperor of the Mexica, Huitzilihuitl, sought a bride. He heard of a great beauty, Miahuaxihuitl, princess of Cuauhnahuac (present-day Cuernavaca), and resolved to make her his queen. Her father, the sorcerer king, Oxomatzin, had her guarded behind high walls and protected by powerful spells. Unable on several attempts to gain entry to the palace and continually rebuffed by her father, Huitzilihuitl shot an arrow, decorated with symbols of his love and carrying a precious jade bead, into her compound. When it landed the arrow broke open. Miahuaxihuitl saw the arrow and understood the symbols of love. She picked up the bead and tested it with her teeth, accidentally swallowing it, and thus magically became pregnant. Her child was Motecuhtzoma Ilhuicamina. Perhaps this is the origin of his sobriquet: Ilhuicamina, “He who shoots an arrow to the sky.”

—John F. Schwaller

The rule of Motecuhtzoma saw several important events in Mexica history. In the early years of his rule the Mexica became bogged down in a seemingly never-ending war against Chalco, a rival city to the southeast in the valley, but the Mexica were eventually victorious. Famine caused by unseasonable frosts, drought, and other climatic disturbances also gripped the region. This coincided roughly with celebrations for the New Fire ceremony, the equivalent of the end of a century, in reality a 52-year cycle. According to Mexica thought, the world would end at the conclusion of such a cycle, and so the ceremonies were extremely important to ensure the continuation of existence. The combination of famine and the New Fire ceremony caused Motecuhtzoma, advised by his uncle Tlacaelel, to inaugurate a new type of warfare, known as the Xochiyaotl (Flower Warfare). The purpose of this warfare was to capture opponents to be

used in human sacrifice. Thousands of victims were needed for the New Fire ceremonies. The surrounding peoples also shared the same religious beliefs as the Mexica and thus were willing to participate in these wars. While their primary purpose was to gain captives, the Mexica and their neighbors also used them to further political ends by gaining power over other cities, all of which furthered Mexica expansion.

Motecuhtzoma ranks as one of the great lawgivers in Mexica history. He developed the legal system to a greater degree than had his forebears, and he established a series of courts to hear cases from throughout his realms. Some of the judges were highly specialized, such as the judges in the marketplace who heard cases arising from the business of the market. Each of the neighborhoods of the city also had judges, and Motecuhtzoma established a supreme council of judges to hear appeals from lower courts. Moreover, he developed a system of sumptuary laws

whereby warriors and rulers could wear certain types of garments that were forbidden to others. While the nobility had generally been limited to those who could claim descent from the ruling family, under Motecuhtzoma it was opened to leading warriors.

THE HISTORICAL PACHACUTI

Solid historical evidence regarding Inca rulers up to and including Pachacuti is elusive. Even the dates of their reigns are uncertain because the Andean people were not concerned with recording historical events in terms of solar years. The sixteenth-century Spanish chronicler Miguel Cabello de Valboa dated Pachacuti's reign from 1438 to 1471, which seems reasonable in light of the oral traditions available to him. The record of Pachacuti's conquests was also retained on the *quipus*, the Incas' knotted-string recording devices. However, it also seems reasonable to suggest that maybe the impressive list of reforms and later conquests ascribed to Pachacuti was not so much the work of a single individual but instead reflects a less dramatic longer-developing emergence of Inca predominance in the Andes. Moreover, Pachacuti's reputed interest in history possibly was a manifestation of his or others' desire to manipulate the accounts of Inca origins and expansion. It is conceivable that part of what might have been an invented history of the emergence of the Inca empire was an exaggerated or wholly fabricated account of the Chanca attack.

—Paul R. Steele and Catherine J. Allen

Pachacuti Inca, Legendary Empire Builder

According to tradition, Pachacuti Inca (r. ca. 1438–ca. 1471) was the youngest son of the eighth Inca, Viracocha. Around 1438, the city of Cuzco was threatened by the Chancas, a rival ethnic group. Viracocha Inca and his eldest son, Urco, fled the city, leaving its defense to Pachacuti (who at the time bore the name Inca Yupanqui). While Yupanqui struggled to gain help from surrounding people, he was unexpectedly aided by the miraculous appearance of 20 squadrons of Pururaucas, stone warriors who after the victory turned back into rocks on the landscape. Many of the more than 300 shrines surrounding Cuzco were believed to be these stone warriors.

The chroniclers also described Yupanqui's struggle with his father and older brother for the royal tassel, the Inca insignia of sovereignty. After this miraculous victory, Viracocha was forced to return to Cuzco to confirm Yupanqui as the new Inca. During this ceremony, Viracocha bestowed a new name on his successor: Pachacuti Inca Yupanqui Capac Indichuri, which

means “World Reversal (literally ‘time change’), King Yupanqui, son of the Sun.”

The use of the epithet “Pachacuti” is often thought to apply to the new king’s role as revolutionary reformer of Inca society and creator of the Inca empire. Tradition further records that following his installation as Inca, Pachacuti embarked on a wholesale reorganization of all facets of life in and around Cuzco, which he rebuilt according to a grand new plan. Central to the reconstructed city was the Temple of the Sun, whose cult seems to reflect Pachacuti’s personal devotion and patronage. The reforms that inaugurated Pachacuti’s reign were followed by rapid expansion of the Inca state through an impressive series of conquests, and as his armies advanced they brought with them the Sun cult. The conquests continued under Pachacuti’s son and grandson, Tupa Inca Yupanqui and Huayana Capac. By the 1520s the Incas dominated most of the area covered by the Andean mountain chain, roughly 3,100 miles (5,000 kilometers) from north to south. Never before had this vast region been united under one state.

Apparently aware of his pivotal place in Inca history, Pachacuti likewise took great interest in the histories of previous Incas and ordered the performance on ceremonial occasions of poetic songs that recalled the deeds of his predecessors. Pachacuti’s mummified body was later housed in a temple located in Cuzco. Lying beside the dead Inca was the body of his enemy, the defeated Chanca leader.

Pachacuti built the ceremonial complex of Sacsayhuaman, located on a hill above Cuzco, in the fifteenth century. (Corell)

Warriors by Caste—The Rajputs

The Rajputs, warriors of mixed ethnic and social-historical background, rose to prominence during the ninth to eleventh centuries and ruled many northern and central Indian kingdoms and princely states in a vast region known as Rajputana (Land of the Rajputs) until the nineteenth century. The Rajput ethos was martial. Death on the battlefield was their highest achievement and was considered equal to a sacrifice. Memorial stones for fallen warriors and their horses contributed to the deification of historical heroes, and poets gave further voice to this warrior ethos. The warrior enhanced his reputation and that of his clan by gaining epic fame or even divine status after his self-sacrifice in battle.

Rajputs generally combined agricultural settled life and cattle herding with military service. Little consensus exists on early Rajput history, as available historical data consist mainly of semi-historical, often legendary collections of facts and figures, names, and different versions of stories. Early Rajput genealogies are to be regarded with caution. What is evident, though, is that the earliest Rajput kingdoms were founded by small war bands, groups of armed men in search of plunder and land who managed to occupy a modest territory. They ardently defended and protected their newly won terrain and especially the cattle

➤ RAJPUT ORIGINS

Because Rajputs are not mentioned in ancient sources, various theories on their origins have been advanced. The word *rajput* itself is a corruption of the Sanskrit *rajaputra* (son of a king). The term was widely used in ancient texts, but the persons referred to were not necessarily all early Rajputs, as is often claimed. Instead, Rajputs form a collection of various clans from different regions and likely lack a shared ancestry. Rajputs claim descent from three major lineages, all somehow connected to the Hindu god Vishnu: the Sun lineage (Suryavamsha), the Moon lineage (Chandravamsha) and the Fire lineage (Agnivamsha). The first lineage began with the mythical king Ikshvaku and included Rama, an *avatar*, or incarnation, of Vishnu. The second lineage belonged to epic kings, such as Bharata, Kuru, and Yudhishtira, and to Krishna, another avatar of Vishnu. The third lineage originated from fire and the god Agni. According to one myth, the kings of northwestern India were exterminated by Parashurama, another avatar of Vishnu, in the last centuries BCE. A sacrificial fire was lit at Mount Abu, Gujarat, to seek new protectors from the gods. Depending on the version told, a youth or four warriors and an elephant emerged. Rajput myth and histories mention two additional lineages: one that claims ancestry from divine snakes (Nagavamsha) and the other that traces its history to the ancient Seers (Rishivamsha).

—Alexandra van der Geer

won in battle or robbed during the many cattle raids.

During the twelfth to fourteenth centuries, these territories grew larger and gradually developed into kingdoms. Typically the founders of Rajput realms were ascribed a glorious past, including a heroic death. Whereas the early Rajput warriors came from different social and ethnic backgrounds, later Rajput rulers claimed a “pure-blooded” aristocratic status.

Rajput territories were repeatedly invaded by Afghans, Mongols, and Turks beginning in the early eleventh century. For political reasons, several Rajput rulers agreed upon military and marriage bonds with the Islamic invaders, but only a few converted to Islam, contrary to what most

Mughal and colonial sources maintain. Except for rulers and high-ranking military officials, the majority of Rajputs came into contact with Mughals only intermittently.

Of these invasions, the fall of Chittor (1303) is especially remembered in legends and stories until today. Ala-ud-din Khilji, sultan of Delhi, supposedly attacked the fort after having heard of the beauty of its queen. When defeat was unavoidable, the men of the city sallied toward the besieging army in saffron-colored mourning garments for one final heroic fight to certain death, while the queen led the women of the citadel, dressed in wedding dresses, into death by fire. This self-immolation, known as Jauhar, and suicidal fighting, known as Saka, were a regular practice among Rajputs when defeated, whether by Mughals or by rival Rajputs.

Three major lineages (*vamsbas*) are recognized in official Rajput myths and 36 major clans (*kulas*). There is evidence that in their early period of development Rajputs married outside their clans. As they developed a self-consciousness as a people apart from others, however, Rajputs were expected to be strictly endogamous, marrying only within their clan and lineage. Within the Hindu social system, Rajputs traditionally reckon themselves to be of the Kshatriya caste, the social order of warriors and rulers. However, this mythical link is thought to have gradually lost its meaning from the tenth century onward, when part of the emerging Rajput aristocracy no longer felt the need to legitimate its ambitions by claiming Kshatriya status but instead defined their role solely in terms of being Rajputs.

Knights and Samurai

During the era 1000–1500 CE, two types of mounted warrior rose to political and social prominence in Eurasia: in Western Europe the heavily armored warrior known as the knight, and in Japan the archer-swordsman known as the samurai (retainer). These mounted warriors differed from earlier European and Japanese cavalry not so much in the weapons and tactics they employed as in their culture and organization. Although mostly of humble origin and stemming from diverse social backgrounds, both knights and samurai eventually developed into distinct privileged classes. In Europe, the old aristocracy came to coalesce with the new military elite to form a single knightly class. In Japan, on the other hand, the samurai ended up replacing the old court aristocracy. Changes in technology, tactics, and military organization made knights outmoded from approximately the late fourteenth century onward. In contrast, samurai retained their military, social, and political importance until the Meiji Restoration of 1868.

Both knights and samurai attained political and social prominence as a result of governmental weakness. In northwestern Europe, the breakup of the Carolingian empire in the mid-ninth century and the unrest stemming from the tenth-century Viking invasions led to the proliferation of petty lords and castellans, who took advantage of the instability to usurp the duties and prerogatives of comital officials, such as collecting taxes and dispensing justice. These minor warlords carved out their own private domains, which they dominated by means of small fortresses and castles. Together with the garrisons of their fortresses and castles, these minor warlords came to comprise the bulk of the new knightly class. In the interest of self-preservation, they bound themselves to greater lords by oaths of fealty and acts of homage, an act of symbolic subservience by which a vassal (subordinate) became “the man” of a lord. In exchange for military

Knight from a twelfth-century Genoese manuscript, juxtaposed with a Samurai on horseback from a nineteenth-century illustration. (Corbis/Library of Congress)

service and a limited number of other duties, known as feudal dues, they received protection and grants of income-producing property—usually lands—as fiefs from their overlords. Because the Latin term for fief is *feudum*, historians have termed this relationship *feudalism*.

In Japan, the inability of the imperial government to maintain the old Ritsuryo system of land tenure and military organization led to the militarization of many of the wealthier provincial families and their transformation into military houses. They became responsible for the police and military work of the provinces, and the imperial government relied upon them to put down the numerous rebellions that occurred there in the eleventh and twelfth centuries. The involvement of these newly evolved samurai—hereditary professional warriors skilled at archery, swordsmanship, and riding and possessed of extensive landholdings—in the court politics of the mid-twelfth century led to their wresting power away from the aristocracy and emperor and to the establishment of successive military governments: the Kamakura bakufu, or “tent government” (1185–1333); the Ashikaga shogunate (1338–1573); and finally the Tokugawa shogunate (1603–1867).

A number of factors contributed to transforming knights and samurai into distinct social classes. In Europe, similar military training, the

➤ FEUDALISM

It used to be fashionable to describe the political, military, economic, and social organization of medieval Europe and premodern Japan as “feudal” or as examples of “feudalism,” namely a system in which lords, served by a warrior elite who enjoyed a measure of social and economic status and often some delegated political authority, ruled over essentially autonomous local governments even as they acknowledged the theoretical sovereignty of a king or emperor. Many contemporary historians, however, have begun to avoid these terms, which they criticize as vague and uninformative and which, according to at least some of them, group together unrelated phenomena as parts of a single coherent system. In the case of Japan, moreover, these terms are further criticized as simply another instance of cultural imperialism, the attempt to impose a Western conceptual model on an incommensurate Japanese reality. Regardless of whether we ought to use the term feudal to describe Europe and Japan in the era 1000–1500 or whether feudalism ever existed as a system in either region during this period, it is clear that the components of feudal society or feudalism existed in both medieval Europe and premodern Japan, the most important of these being a military aristocracy bound by ties of kinship or loyalty to other members of the same military class and dependent primarily on landed property rather than commerce or industry for their wealth and a subject peasantry both exploited by the military aristocracy and dependent on it for protection.

—John Wei

use of common ceremonies, and the development of a code of chivalry, or knightly conduct, led to a conception of knighthood as a brotherhood in which all members, whether simple warriors, minor nobles, greater magnates, or kings, were equal. However, the very fact that fighting on horseback was the principal occupation of the nobility, coupled with the desire of nonnoble knights to enhance their status and guard their privileges, led over time to an elevation in the status of the ordinary nonnoble knight to the ranks of the nobility and to restrictions on entering the knightly class.

In Japan, a common culture also contributed to the development of samurai into a separate social class, although the main factor was legislation in the late 1500s and early 1600s. Most samurai originally came from small landowning families able to equip and train their sons for war. The most prominent, however, such as the Taira and Minamoto, were descended from cadet branches of the imperial or aristocratic families. With the rise in social position occasioned by the establishment of the Kamakura Bakufu and later military governments as well as the concomitant increase in opportunities for samurai to acquire property, the samurai increasingly came to form a privileged class, adopting many of the habits and culture of the court aristocracy. The need for larger armies during the Warring States Era (1478–1578), however, served to blur the boundary between samurai and nonsamurai by spurring *daimyos* (lords) to recruit new samurai retainers from among the more well-to-do peasantry. This confused state remained until the edicts of Hideyoshi in the 1580s and 1590s and the legislation of the early Tokugawas, which established a rigid class system, making warfare the sole preserve of the samurai and banning nonsamurai from carrying arms.

Changes in military organization and improvements in technology had different effects on knights and samurai. In Europe, the increasing use of mercenaries and the rise of the foot soldier and archer led to the knight's military decline from the fourteenth century onward. Because the usual feudal contract obliged knights to only 40 days of military service, kings in the later Middle Ages often preferred that knights pay a fee, known as *scutage*, in lieu of service, using the money gained from *scutage* and other taxes to hire mercenaries. Unlike the poorly trained levies of peasants often used earlier in the millennium, in the several centuries before and after 1500 mercenary pikemen would stand firm against cavalry charges, presenting a wall of spears capable of skewering knights and horses. The increasing use of skilled archers also contributed to the military decline of knights, as did the development of firearms.

Samurai adapted more readily to changes in military tactics and technology. During the War-

ring States Era, warfare came to depend more on organizing large armies than on individual skill and one-on-one combat. Although samurai continued to remain the military elite, they now served as army officers, commanding contingents of common soldiers rather than simply engaging in battle on horseback. They devised tactics for integrating infantry maneuvers with cavalry and for using Western firearms and cannon. The samurai's military dominance throughout the following Tokugawa period (1603–1867), however, was not due to any special military prowess or adaptability on their part but instead was the result of Tokugawa legislation that made samurai the sole military force.

Courage Cultures—Turks, Mongols, Warriors of Oceania, and American Indians

Although courage plays a significant role in many societies, a few cultures may be considered courage cultures due to the particular emphasis that is placed on courage, particularly in regard to leadership. Generally, courage cultures have been found in nonsedentary or semisedentary societies that have dwelt in harsher environments or at least without the amenities of large cities and towns. Furthermore, in these societies male warrior elites have formed bonds of personal loyalty to each other and their leader, dominating society by reason of their martial valor. Although physical prowess and courage have traditionally been highly valued attributes, the warrior elites' ability to provide wealth for the tribe, including adding to its numbers of animals and even people, have mattered the most. In addition, endemic interclan or tribal warfare historically helped maintain the importance of the warrior

elite and also prevented cooperation between competing groups. Among the most notable courage cultures of the period 1000–1500 were the Turks, the Mongols, warriors of Oceania, and American Indians.

The Turks and Mongols had similar concepts of courage, as they possessed strikingly similar pastoral nomadic cultures and inhabited the same regions of Central Asia. Indeed, the fluid nature of Inner Asian nomadic tribal life allowed members of the same tribe to claim two separate ethnicities. Although lineage played an important part in choosing leaders, ultimately the selection came down to the best fit in terms of providing wealth for the tribe and the leader's warrior companions. This included success in war, raiding, livestock rustling, and occasionally personal combat. Success in doing so inevitably attracted *nōkōrs*, or warrior companions, to a leader, providing him a loyal body of men who were often not originally members of his tribe. A leader's failure to provide goods and the resultant loss of honor could also lead to his companions abandoning his cause.

Courage in battle could be manifested in a variety of forms. Unlike many courage cultures, such as the Celts and Germans of antiquity, pastoral nomads did not place an emphasis on close combat or one-on-one duels. Rather, one's ability to ride expertly and even recklessly and accuracy with the composite bow were crucial qualities for any warrior who aspired to high status, although the best archer or the best rider was not necessarily the chief. Although their forms of warfare depended essentially on carefully honed tactics that depended on the equine and archery skills of the entire body of warriors, individual warriors could and did improve their status through acts of courage. One such opportunity for displaying personal courage took place during the *nerge*, a battue-style hunt in which a circle of hunters on horseback closed in on their prey. As the ring of hunters tightened, individuals tried to impress the khan with their valor by such acts as wrestling with lions, tigers, or bears with a knife or bare hands. Others demonstrated their archery abilities by shooting small animals at a gallop.

The warriors of Oceania were a sedentary courage culture, although they could be

➤ COUNTING COUP

Counting coup was a tradition among most of the tribes of the Great Plains, most notably the Cheyenne. The term is derived from the French verb *couper*, meaning “to cut or strike.” During a battle, a warrior rode toward the enemy, even as they shot at him, and touched the enemy with a coup stick, bare hands, or even a weapon in a nonlethal manner. Although killing an opponent was a display of courage and martial prowess, the ability to demonstrate that “I could kill you but I choose not to” showed the warrior’s comrades and enemies alike the superiority of his skills and courage. Those who were killed after counting coup also received great honor in their memory. As the tradition progressed, warriors carried coup sticks, often decorated and ornate. Warriors would vie to be the first to count coup against an enemy. Depending on the tribe, the first three or four touches would be counted and awarded. Those who did this successfully and survived received eagle feathers for their headdress or an increase in tribal status. The warrior who was the fourth touch might be awarded a buzzard feather. Of course, this form of bravery also exposed the warriors to great perils, particularly when fighting against societies that did not practice counting coup.

—Timothy May

considered sea nomads. Perhaps the most notable were the Maoris of Aotearoa (New Zealand), who placed emphasis on single combat or duels over group warfare. Although the Maoris engaged in group combat on a regular basis, it was in single combat where the warrior demonstrated his courage and pride. To demonstrate his courage and ability and to intimidate his foes, a Maori often displayed his *mana*, or powers of self-confidence, during the *haka*, a stylized war dance that combined storytelling with acts of physical intimidation (a practice that today is memorialized before each match by New Zealand’s national rugby team, the All Blacks). In addition, the bravery of a warrior could be shown through daring raids and sorties. Leaders also demonstrated their prowess and skill not by headlong charges into combat but by arranging am-

bushes and successful raids with little loss of life. Leaders who had high body counts among their men rapidly lost honor.

Less savory aspects of the courage culture of the Maori, at least from the viewpoint of the defeated, were cannibalism. The Maori practiced ritual cannibalism by eating their vanquished foes. In doing so, the Maori not only physically defeated their enemies, but the consumption of the body destroyed their mana. Maori cannibalism consisted of not only eating the flesh but also drinking the blood of the enemy. Heads were taken as trophies, as were hands. Contrary to popular myth, the Maoris were not headhunters. Rather, the heads came from the slain or those devoured in the ritual cannibalism. Furthermore, ritual anthropophagy only occurred as part of sacred warfare, and not all prisoners were eaten. This was done to demonstrate to the defeated that “we can do this anytime we want.” In effect it was a very visual display of dominance.

Displays of courage among Native American warriors took place in many ways. Bravery in combat almost always equated with an increase in status in the tribe. This could be achieved by rescuing fellow warriors, attacking or overcoming great odds, and horse rustling, particularly if it involved sneaking into the enemy’s camp. Killing an enemy in close combat was more honorable than shooting him from a distance. Among many Great Plains tribes, the greatest display of personal bravery came in the form of counting coup. Among the Kiowa and Crow, the status of the chief was based on acts of bravery, especially counting coup. Some groups wore eagle feathers to indicate the number of enemies a warrior had slain or against whom he had counted coup. Bravery was encouraged among Native American youth through a series of rites of passage, the most notable being the vision quest. In this quest, the youth ventured into the wilderness alone, often with no clothing or food, and awaited a vision, which was later interpreted by the tribal elders.

Many tribes also viewed bravery under torture as a virtuous quality among warriors. Among many northeastern groups such as the Huron and Iroquois, prisoners had to run a gauntlet in which they were subjected to attack and unable to defend themselves. If they survived the gaunt-

let, the warrior could be adopted into his captor's tribe or even released due to his bravery. If he failed, he was usually tortured and executed. The torture was not confined to that conducted on enemies but also included ritual torture or self-mutilation in rites of passage such as that practiced by the Mandans, or Numakikis, in the Okipa ceremony. The individual's breast was pierced, and then he was suspended by the piercings in hopes of attaining a vision.

All of these groups placed an emphasis on courage as a qualification for status and leadership. While sedentary city-based societies often dismissed them for their primitive manners, they also, sometimes begrudgingly, admired them for their courage. Indeed, in many cases it was the honor and courage that these groups displayed that redeemed them in the eyes of their neighbors. In Eurasia, Turks became a favored mercenary group, while in the Americas, Europeans routinely used Native American warriors partially due to the ferocity of their attacks that came from the milieu of their courage culture.

■ Introduction: The Tools of Warfare

Leaving aside the issue of whether warfare can be either a science or an art, there is no denying that the period 1000–1500 was one in which several significant changes took place across the world in the ways in which war was conducted. Both its techniques and technology took a radical turn and, in at least one instance, had consequences that profoundly altered the course of world history.

Without a doubt, the most significant development was the origin and continuing development of gunpowder as a tool of combat and the consequent diffusion of gunpowder weapons. Gunpowder weaponry, when used and improved upon by the Mongols, enabled horse-riding steppe warriors to become successful besiegers of cities in the thirteenth century. Projectile-firing weapons propelled by gunpowder began to revolutionize warfare in Western Europe in the fourteenth

century, enabled Western Europeans to begin to establish a significant presence along the North and East African coasts during the fifteenth century, and would make far easier their entry into the Indian Ocean and the Americas in the years immediately preceding and following 1500. Cannon capable of firing balls long distances enabled the Ottoman Turks to isolate Constantinople by shutting down its maritime lifeline and then to breach its massive triple land walls that had, to that point, successfully kept invaders at bay for 1,000 years. With the capture of Constantinople in 1453, the first of the three great Islamic “Gunpowder Empires” had reached maturity.

Contrary to popular opinion, cannons did not render static fortifications useless, just as earlier artillery that was capable of battering down walls, such as the counterweighted trebuchet, had not made strongholds of stone obsolete. What both

forms of artillery did influence, from the twelfth century onward and well into the late eighteenth century, was the engineering of more sophisticated and artillery-resistant fortifications and the technique of counterbattery fire, whereby soldiers in a defensive position concentrated fusillades upon the enemy's artillery positions.

For western Eurasia, the horse was a major military factor during these five centuries and would be so for centuries to come, even though by the fifteenth century cavalry was increasingly giving way to well-disciplined and often professional infantry in Europe. In Central Asia and China the horse of the steppe was a primary means of attack throughout this period, especially when ridden by the Mongols and the armies of Timur-i Leng. Although driven out of China in 1368, Mongol horsemen continued to be a major disturbing factor along the Middle Kingdom's northwestern border well past 1500, necessitating the Ming dynasty to construct major portions of the Great Wall that now so impresses tourists. The wall was not a static defensive barrier but served rather as an outpost from which beacon towers could immediately signal the rapid advances of steppe invaders and was also a fortified position from which offensive forays could be launched. In Africa's western Sudan, the horse, imported as a precious commodity from across the Sahara, not only became a symbol of status but also allowed the trading empires of Mali and Songhay, as well as smaller polities, to develop increasingly large cavalry squadrons. The horse was unknown in the Americas until brought there by the Spaniards. Once introduced, it proved to be an intimidating element during the early stages of Cortés' campaign in Mexico. Later, wild horses, captured and trained by the natives of the North American Plains, would revolutionize their entire culture and ways of fighting.

Naval vessels also underwent significant changes during these centuries. During the crusades, Italian maritime cities developed horse transports that allowed for the fairly safe passage and, just as important, fast disembarkation of horse and rider during amphibious operations. The grand fleets of the Yongle emperor that sailed into the waters of the Indian Ocean during the early-fifteenth-century voyages of Zheng He included massive transports, or treasure ships.

Such ships enabled the admiral to transport tens of thousands of combat troops, who successfully asserted Chinese military power on several occasions. It appears, however, that these ships, while suitable for the relatively placid waters of the Indian Ocean and adjoining seas, would not have fared well had they attempted a cross-Pacific voyage or attempted to round the southern cape of Africa. Much smaller craft developed by the seagoing kingdoms of European Iberia proved, by the end of the fifteenth century, to be much more suitable to the latter task and also for transatlantic voyages. Moreover, fitted as they were with superior cannon, they enabled the Portuguese and, later, other Europeans to become a major presence in the Indian Ocean and beyond.

As we have already seen, warfare remained a constant of life around the world during these five centuries, but several technological innovations in Eurasia, most notably the application of gunpowder to military use and the development of effective cannons for use on both land and sea, set the stage for a coming revolution in world history.

—*Alfred J. Andrea*

Transit of Arms and Armaments across Eurasia

Most military powers have always tried to learn from their opponents and acquire arms and armaments that might even the odds or allow an advantage, but in the medieval period two events in particular contributed to the spread of arms and armaments across Eurasia: the crusades and the advent of the Mongol empire. The crusades brought about an exchange in weaponry, tactics, and defensive technology through the medium of warfare. While the Mongols brought an unprecedented level of warfare to Eurasia, their primary contribution to the transit of arms and armaments across Eurasia came through the Pax Mongolica and the resultant exchange of ideas.

Military architecture is one of the most obvious transfers that occurred during the crusades, as veterans of the crusades returned to Europe having seen the impressive Byzantine, Armenian, and Islamic fortifications of the Middle East. At the same time, other transfers occurred. Siege

► DESIGN OF CROSSBOW AND TREBUCHET

Two of the most important weapons of the medieval period, particularly in terms of advances in technology, were the crossbow and the trebuchet. Both weapons had a tremendous impact on warfare and caused changes in armor and defenses simply to lessen their effectiveness. This, however, then triggered new changes in the design of each weapon to overcome the new defensive technology.

A basic wooden stock with a groove for a bolt with a short bow at the end was all that was required for the crossbow. A trigger, resembling a lever, was added to allow the user to handle the weapon better. Due to the shortness and stiffness of the bow, the crossbow had considerable power, and its bolt was able to penetrate chain mail quite easily. Also unlike traditional bows, it was much easier to aim, thus making it an ideal weapon for mass formations. The bow was drawn first by hand but later with a loop. A foot was placed in the loop, and the archer bent over and then stood up to pull the bowstring back. As the bow became more powerful, a hook, or claw, was used to assist the crossbowman in arming his weapon. In the late fourteenth and fifteenth centuries as the bow's strength was increased, often by being made or reinforced with metal, a hand crank was used that gave the bow a pull of 150 pounds, slightly greater than either the Welsh longbow or the Mongol war bow.

The early trebuchet, or traction trebuchet, functioned as a fulcrum and lever system. Essentially a plank with one end constructed to accommodate a missile, usually a stone, sat atop a fulcrum structure, often appearing as an inverted "U." The weapons crew shot the weapon by pulling ropes attached to the other end of the plank. Trajectory could be adjusted by adjusting the plank so that the missile side could be lengthened or shortened. Distance and power were adjusted by adding more manpower. The size and length of the plank ultimately dictated how powerful the weapon could be. Thus, it could be used as an antipersonnel weapon to clear walls or as artillery to shatter walls. The trebuchet was modified by adding a sling to it so that as the lever was pulled, the sling was pulled from underneath, and the missile was released at the apex of the firing arc, thus allowing greater range and power. It is not clear when the sling was added, but definitely

Illustration of an early thirteenth–fourteenth-century counterweight trebuchet. (Art-Tech)

it was present by the tenth century, as all illustrations after this show slings. Perhaps the most significant change occurred in the late twelfth century as manpower was replaced by weights that could be increased or decreased, again providing a greater range and more force to the missile.

It is not clear who first created the counterweight trebuchet, but it appears that it was in the Middle East. Evidence points to Muslim, Byzantine, and even Western European engineers; in the volatile era of the crusades the most common military engagement was the siege. In the late thirteenth century it could also be modified to fire massive logs as well as stones. The counterweight was significant not only in that it provided greater power and the ability to fire heavier missiles, but it was also potentially safer for the crew. In at least one recorded instance with a manually pulled trebuchet, the missile barely left the sling and killed one of the trebuchet crewmen.

—Timothy May

warfare advanced considerably due to the crusades. Just as Europeans copied the military architecture they encountered during the crusades such as the Armenian round tower, they also had to find new ways of overcoming it. Although Middle Eastern military architecture was more advanced than that of Europe, crusaders and the colonists who followed brought new carpentry skills that assisted in the development of better siege engines, including ultimately the counterweighted trebuchet.

The crusades also helped spread the use of the crossbow, which the Chinese had developed more than 1,000 years earlier, and they also contributed to its technical improvement. The crossbow had already been used in Europe for a long while, but the Church officially banned its use against Christians even though the ban was often ignored. Richard I (1157–1199) of England greatly promoted its use during the Third Crusade (1189–1192) and demonstrated its effectiveness at Arsuf in 1191. Ironically, he was killed by a crossbow bolt while campaigning in France in 1199. Muslim armies did not use the crossbow extensively, but it became a prominent feature of the Franks during the decades that followed. It also became, along with the heavily armored knight, a hallmark feature of crusading armies whether in the Holy Land, Spain, or the Baltic.

Perhaps the best example of the transit of arms and armaments in the age of the crusades and following is the counterweighted trebuchet. The traction trebuchet was used in ancient China as early as 121 CE, with missiles being fired by traction, namely by men pulling a lever with ropes. By the late sixth century the Byzantines were using traction trebuchets that had apparently been introduced to them by the Avars in their attacks on Byzantine territories. The Avars, a steppe group that may have been displaced by the Turks in Mongolia, presumably brought the technology from China. Arab armies adopted traction trebuchets by at least 683 CE. Presumably these trebuchets spread through most of Europe not long after, as they were used in sieges in Germany by the 900s. Yet it is not clear if all of these machines were trebuchets or another type of siege weapons known as petreries. Petreries, or smaller traction stone throwers, were used in the First Crusade at Antioch (1097–1098), but

these were more antipersonnel weapons and were not capable of demolishing walls.

Traction trebuchets were used in the crusades by the twelfth century, and counterweight trebuchets made their appearance by the late twelfth century. Indeed, by 1187 Saladin had manuals that discussed both traction and counterweight trebuchets. Counterweight trebuchets reached England around 1200. Although Marco Polo claims credit for bringing the technology to China, the Mongols already were employing counterweight trebuchets a few years before Polo arrived. Indeed, Muslim engineers from the Middle East built them in 1273, and it was the deciding element in the siege of Zaitun. Thus, the trebuchet returned to China in its new form. In addition to its devastating ability to destroy walls, the counterweight trebuchet forced defensive engineers to construct higher walls due to its higher trajectory.

Although somewhat late in adopting the counterweight trebuchet, the Mongols were quick to adopt other weapons, and they and their empire spread arms and armaments in an unprecedented manner. The rapid pace of the Mongol conquests demonstrated the superiority of the steppe composite bow and the mounted archer. While much of Central Asia and the Middle East had already adopted large numbers of mounted archers, new areas also incorporated them. Although the princes of medieval Russia had fought against and alongside steppe nomads for centuries, their forms of fighting and equipment remained quite different. This changed with the Mongol conquests. Almost immediately, the Rus realized how ineffectual their own military equipment was against the Mongols and began transforming from a cavalry based on shock and melee weapons to horse archers. Western Europeans did not transform their militaries in face of the Mongol threat, although at least one observer, John of Plano Carpini (ca. 1180–1252), strongly urged them to double their armor and equip themselves more like the Mongols.

Some scholars also attribute the spread of scimitars and sabers to the Mongols. It is known that most swords in the Middle East were straight-bladed until around the thirteenth century, whereas pastoral nomads tended to use curved blades, which were better suited for war-

fare from horseback. Still, the evidence is not conclusive, as Turks had migrated into the Middle East and India centuries earlier.

The spread of gunpowder may also be attributed to the Mongols. Although there is no evidence that they used gunpowder weapons outside of East Asia, in the mid-thirteenth century recipes for gunpowder circulated in Europe in the writings of Roger Bacon (d. 1292), a Franciscan scientist and philosopher. It is probably not a coincidence that Bacon communicated with William of Rubruck, a Franciscan friar who traveled to Mongolia in the years 1253 to 1255 and left a detailed record of his impressions. Although he does not mention gunpowder in his own account, it is quite possible that Friar William served as a spy, much like his predecessor, John of Plano Carpini.

With the Pax Mongolica, moreover, travelers such as Marco Polo and Ibn Battuta could travel extensively across Eurasia in relative safety, thus witnessing and bringing back new ideas and technology as well as sharing their own knowledge. Furthermore, the early cannons of Europe were suspiciously like those of the Yuan dynasty. In addition, fourteenth-century Europe witnessed the arrival of lances and spears with gunpowder tubes attached to them, early flamethrowers very much like the fire-lances that the Chinese used against the Mongols a century earlier.

Gunpowder Weapons before 1500

Gunpowder weapons originated in China in the eleventh century and spread outside of East Asia through the agency of the Pax Mongolica (Mongol Peace). Trade routes became substantially better guarded and more open during the Mongol empire, thus allowing merchants to not only travel safely but also to facilitate the greater movement of goods and ideas, including the recipe for gunpowder.

Early uses of gunpowder included fireworks, but the earliest military use of gunpowder in the eleventh century, during the Song dynasty (960–1279), was in the form of incendiary devices such as firelances, gunpowder-filled bamboo tubes attached to a spear. When lit, it acted as a primitive flamethrower. Other uses included a variety of gunpowder recipes that when used in bombs or other devices either produced noxious and possibly poisonous smoke or ignited into a ball of flame, rather than an explosion, that was difficult to extinguish. Some had spikes attached to the bomb, but not to be used as shrapnel. Rather, when the bomb was hurled from a trebuchet against a ship or a building, it would attach itself, and the resulting fire would spread from that point rather than hitting and igniting but then falling away harmlessly.

During the twelfth and thirteenth centuries the Song empire developed recipes for gunpowder with explosive properties, and its soldiers began launching projectiles from bronze tubes and vases. These usually fired arrows or exploded and channeled the blast forward, again into an eruption of flame. While these devices were not very effective by themselves, the Song often mustered these into groupings of hundreds and even thousands, demonstrating that large amounts of gunpowder were available. The first actual firearm appeared in the first half of the thirteenth century with a short barrel 6.9 inches (17.5 centimeters) long and 1 inch (2.5 centimeters) in diameter. Actual cannon, often made from cast iron, did not appear until the 1300s. Although primitive, unwieldy, and unreliable, they were produced in large quantities for use against fortresses in China by the Mongols and the nascent Ming dynasty. Generally speaking, most of the

—Timothy May

firearms and cannon took a long time to load and were not very accurate, thus often rendering them rather ineffective. However, the fact that soldiers could become adept in their use quickly allowed the sheer volume of large numbers of firearms to overcome some of their deficiencies.

The Mongols were tied to the rise of European hegemony by more than their spreading gunpowder via trade routes. The Mongols also influenced their neighbors through their tactics and weapons. As the composite bow of the steppe nomads had a better range, accuracy, and rate of fire than early firearms, nomadic armies could decimate firearm-wielding infantry. Furthermore, not until the sixteenth and seventeenth centuries did cannon-manufacturing techniques produce easily maneuverable light artillery that could counter the mobility of the nomads.

Meanwhile, kings in Western Europe were virtually the only ones who could afford the expense of making cannon, thus allowing them to increase their power and authority vis-à-vis their nobles. As European fortifications improved against traditional siege weapons, rulers became dependent on cannon to smash castles in order to defeat their enemies and bring recalcitrant vassals into line. Western European armies fought steppe nomads less regularly as well. Thus, mobility was not an issue to knights who had to increase their armor to protect them against crossbows, longbows, and early firearms. As a result the knight became less mobile. Early cannon and firearms, moreover, could be effective against the relatively slow-moving European knights and infantry in a way they could not be against the swift steppe nomads. Of course, the knight gradually disappeared, while light and medium cavalry appeared to counter the artillery.

A similar effect occurred in China. Although cannon were widely available to the Ming dynasty, which drove the Mongols out in 1368, cannon artillery played only a small role in defeating the Mongol, or Yuan, dynasty. Indeed, the Ming use of cannon was limited to siege warfare and battles in South China, although apparently 38 varieties of firearms existed in China and for a wide range of purposes. For the reasons described above, after 1368 the Ming did not use firearms extensively in battles on their northern frontier with the Mongol tribes.

The ramifications of this strategy were great across Eurasia. Countries sharing borders with steppe nomads initially had less reason to develop gunpowder artillery than those that faced sedentary states and consequently lagged behind in the use of cannon. But this began to change toward the end of the seventeenth century when field artillery pieces became more mobile, thus providing support for musket-wielding infantry. These new cannon easily disrupted steppe cavalry formations and possessed a greater range than the composite bow. Only then did steppe warfare decline as the dominant form of warfare. Prior to the 1600s only one state, the Ottoman empire, had formed a truly effective method of dealing with horse archers. This may have been because of the Ottomans' need to deal simultaneously with the strongly fortified cities of

Southeast Europe as well as with the horse archers of the various powers on their eastern border, ranging from the Aq Qoyunlu and the Safavids (defeated at Chaldiran in 1514) to the Mamluk sultanate (conquered in 1516 in Syria and in Egypt in 1517).

Mongols and Gunpowder Weapons

The spread of gunpowder across Eurasia is directly related to the rise of the Mongols. Gunpowder recipes had slowly exited China into nearby regions, but the Pax Mongolica accelerated the spread. Although the Mongols may have used catapult-launched bombs in siege warfare outside of China, there is no definitive documentary evidence to confirm it, as the terms later used for gunpowder weapons are synonymous with naphtha, a petroleum-based incendiary, or with catapults and trebuchets.

The Mongols encountered gunpowder-based weapons early in their campaigns against the Jin empire (1125–1234) in northern China. While firearms in the modern sense did not exist for another 100 years, the Jin did use explosives and fire lances. Explosives, generally known as thunder crash bombs, were primitive yet effective. These were metal containers filled with gunpowder and a fuse, and then delivered through a variety of methods such as hurling them from a catapult or lowering them by chains against Mongol troops at the base of walls.

The explosive, while strong enough to annihilate the enemy as well as wooden or skin-covered shelters, did little damage to the thick city walls. At times the bombs were used as mines.

THE MONGOL HORSE

Although firearms may not have played a primary role in the Mongols' military operations, a major reason for the success of the Mongol armies can be found in their horses. Although small in stature, the size of ponies, the Mongol horse was strong and surpassed all others in endurance. Each soldier took an average of five horses on campaign. When a horse tired, the rider switched and rested the horse for several days. This practice allowed a high rate of travel, up to 100 miles (160 kilometers) in one day compared to 10 or 20 miles (16–32 kilometers) by most armies of the era. The Mongols also trained their horses to increase their endurance, producing a horse that was easily managed by its rider. They also preferred the more docile geldings and mares over stallions, which dominated the battlefield of Europe. One advantage of this choice was that they used mare's milk as an essential part of their rations.

Unlike sedentary armies, the Mongols did not worry about bringing fodder to feed their mounts. Grazing comprised the entire diet of their horses even in winter, as the horses knew how to dig through snow to find grass. Of course, this meant that a constant source of pasture had to be found, which limited the areas in which Mongol armies could campaign successfully and for long periods of time. This more than anything else might have inhibited Mongol advances into India and Southeast Asia and certainly into Syria-Palestine.

—*Timothy May*

Although these were not efficient, inasmuch as lit fuses were needed to ignite the bomb, when properly placed in ambushes they proved to be effective in causing physical and psychological damage.

The Jin used another gunpowder recipe in their fire lances, which were bamboo tubes affixed to spears and functioned as a primitive flame thrower. Like the Jin, the Southern Song empire (1127–1279) also used gunpowder weapons such as thunder crash bombs and fire lances. The Chinese also used fire arrows, or arrows fired from small bronze vessels by a gunpowder explosion. Although not accurate, they could launch an arrow for several hundred yards.

Defending against the thunder crash bombs and fire lances proved a difficult challenge for the Mongols, and it does not appear that they developed any particularly effective defenses against them. Rather, Mongol perseverance in sieges proved to be their most effective counter-tactic. This included starving the opposition as well as pummeling them with trebuchet missiles and flaming arrows. Of course, once the technology was made available to them, the Mongols used explosives against the Jin. However, it is not clear if the Mongols used thunder crash bombs in sieges west of China. One reason may be that whereas in China the necessary materials to manufacture gunpowder, such as saltpeter, were available in sufficient quantities and the expertise to properly mix and store it was also easily available, this was not necessarily true elsewhere. Indeed, even though Chinese engineers accompanied them in their campaigns beyond China, the logistical difficulty of transporting volatile gunpowder may have discouraged the Mongols from carrying significant amounts.

It is known, however, that the Mongol empire was the primary transmitter of the knowledge of gunpowder whether directly, through its use in war, or simply because most of the major trade routes ran through the empire. While it is unlikely that Europe received gunpowder directly from the Mongols, we do know that it appeared there only after the Mongol invasion. Most likely merchants from Europe, such as the Polo family, or from the Middle East traveling through the Mongol empire carried the recipe back. Indeed, gunpowder appeared in the arsenals or in celebrations in the form of fireworks in India, Central Asia, and the Middle East in addition to Europe only after these regions encountered the Mongols. The biggest impact was in Europe, where it contributed significantly to Europe's rising prominence on the world stage after 1600.

Cavalry vis-à-vis Infantry

There can be little doubt that from a military perspective, the period after 1000 was the age of the mounted warrior in continental Eurasia. In Southwest Asia and the Asian steppe, Turco-Mongol nomadic horsemen expanded their influence far beyond their traditional boundaries. In Western Europe and Russia, armies were raised that depended on the heavily armored mounted knight, developing traditions of military service for their upper classes that were ingrained with the concept of men-at-arms. By 1500, however, the age of the preeminence of the mounted warrior was waning. The necessity of infantry forces had already made itself felt with the increase of siege warfare as opposed to battles on the open field, and by the sixteenth century the demonstrated ability of disciplined infantry forces to overcome traditional European cavalry along with the growing prevalence of firearms and the continuation of fortresses as the loci of battles combined to make the mounted warrior if not obsolete then less of a defining force.

When armies engaged in battle, they freely borrowed ideas from each other. Formations, technologies, and the balance between infantry and cavalry were adapted based on new encounters. Nowhere is this cultural diffusion more evident than in the military encounters that settled societies throughout Eurasia had with Asian nomadic tribes. China, which had for centuries been dealing with the "barbarian" threat from the north and west, as early as 300 BCE felt the need to counter these tribes with similarly equipped troops and began to develop cavalry. Similarly, the western Eurasian cultures with which the nomadic warriors engaged also adapted fighting forces in imitation of them.

The European fighting style based on the mounted knight, as it had developed by the late eleventh century, focused on a single massed charge with a lance followed by infantry forces who would then engage in ground combat. This

technique was singularly unsuccessful against the Turks and Mongols from the East. Nomadic warfare in its essence consisted of lightning strikes by mounted horsemen. Both the Turks and Mongols developed this style of warfare to a high degree, using highly trained horses and, from the saddle, firing arrows launched by composite recurved bows. The Turks were also skilled at using lances from the saddle.

The ability of these nomadic horsemen to fight in formation created special difficulties for Western knights during the crusades era. When the knights engaged in a massed charge against an army of mounted Turks or Mongols, the nomads typically refused to engage directly, instead pulling away before impact and then showering the knights with a volley of arrows as they milled around in confusion. Armies on the march, which tended to progress slowly because of the attendant foot soldiers and baggage, were particularly vulnerable, as the highly mobile mounted archers could easily pick men off.

While the Middle East and the West did not have the indigenous tradition of mounted archers as did the Eastern nomads, they did adapt mounted crossbowmen and developed troops of mounted archers as part of their forces. In the Christian East and in Russia, this adaptation went even further. After encountering the Turkish horsemen in the eleventh century, it was not long before the Christians in the East and, later, colonists in the crusader states added regiments of mercenary *turcoples* (light cavalry equipped in the Turkish manner) to their armies. The Russians, after the Mongol invasions of the thirteenth century, copied their style of arms and dress, recognizing its superiority in steppe warfare.

As the cultures that encountered the Turks and Mongols in battle felt compelled to adapt their cavalry style to effectively fight them, so too the nomadic warriors borrowed from China and the West in their development and use of infantry.

The term “infantry” referred to a great many different sorts of skills ranging from archers and crossbowmen, sometimes on horses, to foot soldiers equipped with pikes and other hand weapons to the skilled craftsmen needed to construct siege engines and other accoutrements of war. Even though the nomads would have had little

Illustration of an attack by the Persian cavalry, showing arms and armor of the Mongol army, from Jamia al-Tawarikh, fourteenth century. (The Art Archive/Edinburgh University Library)

use for an infantry force in their traditional style of battle, their usefulness in siege warfare was evident. While the Turks borrowed from Arab and Byzantine examples, the Mongols emulated the Chinese. In their thirteenth-century conquest of China, lacking a large population pool from which to draw, they conscripted infantry of all types from local conquered peoples. At the same time, strong infantry became ever more vital for siege warfare in western Asia and Europe. A massed charge of heavily armored knights was ineffective against stone walls, and other than to enforce a blockade, mounted archers were little better. While the cavalry still maintained a role in siege warfare, it was mainly involved in auxiliary raids in the surrounding countryside, reconnaissance, and finally fighting if and when a breach in a fortress was achieved.

Europe also saw the development of infantry forces conscripted from urban and rural populations for local defense, and in contrast to the more professional foot soldiers who accompanied knights into battle, these formed a formidable force against the knights. When Flemish merchant guilds rebelled against Philip IV of France (r. 1268–1314) in 1302, he sent 2,500 knights and 8,000 infantry to relieve the siege at Courtrai Castle, which was being held by an infantry of guildsmen armed with pikes and small weapons. Strategically positioned to use the natural terrain to their advantage and united by a common cause, they planted the ends of their pikes into

► KNIGHTS AND HORSEMEN FROM THE STEPPE

While there is no denying the cultural importance of mounted warriors in both European and Mongol societies, their training varied greatly. In Europe, sons of noblemen were sent at an early age to the household of a knight or to court, there to spend several years developing their individual fighting skills. In Mongol culture training also started early, with all children riding horses at the age of three or four, but the education of a warrior was handled communally. The goals of each type of training also differed. Children of the steppe were expected to become expert horsemen and archers with a composite bow and to be able to fight in strictly ordered regiments and formations. European youths training to become knights also learned to ride, to handle a lance when charging, and to fight on foot with a sword, but the emphasis was on individual performance. Although many European armies also had mounted archers, there was a clear distinction between the archers and the knights, and the former were considered part of the infantry forces. The horses that they were learning to handle differed greatly as well. The great European warhorses seemed large and clumsy next to the sturdy little Mongolian horses, which had impressive stamina and could live off of forage.

Perhaps the most interesting difference was in the training for group military exercises. For Europeans, much of this happened as a matter of course in the private wars that frequently erupted between families, as well as on the tournament ground, but although the massed charge was the most important element of a cavalry attack, maintaining a strict military organization among the knights was not as highly emphasized. For Mongol horsemen, regimental organization and discipline were crucial to their overall battlefield strategy, and a great hunt was designed that imitated the encirclement tactics used by the soldiers in war. The hunt took place over several days, and any warrior who allowed game to slip by was punished severely, as was his commander. These differences all came into play in determining the long- and short-term outcomes of the direct encounters that knights and Mongols faced in the thirteenth century.

—Laura Wangerin

the ground and did not budge when the massed charge of knights bore down on them. A thousand knights perished, and the French infantry retreated in confusion. This victory was not lost on other armies, which began to employ similar tactics. By 1385, full cavalry charges were becoming a rare occurrence on the battlefields of Europe and the Levant.

Because battles fought by infantry tended to have large numbers of soldiers engaged at close quarters, European chivalric customs, such as hostage taking and ransoming, were no longer practical, and casualty numbers among knights rose sharply. Casualties among infantry also increased, and the battlefields became bloodier. In an effort to maintain large infantry forces, rulers began to hire men to fulfill the various roles of foot soldiers, heralding the beginnings of the large standing armies that became a defining part of the post-1500 early modern West.

Castle Design in Southwest Asia and Europe

The castles of medieval Europe and Southwest Asia differed from earlier fortifications in that they were largely designed for private, not public, defense. Castles were an excellent solution

► KRAK DES CHEVALIERS

The crusader castle Krak des Chevaliers, dominating the foothills of the Syrian mountains northeast of Tripoli, held a central role in the ongoing power struggles in the area. Originally an eleventh-century Muslim fort (Hisn al-Akrad, or Castle of the Kurds), Krak (from the Syriac word for “fortress”) was strategically located between Christian Tripoli and Muslim Hamah and Homs. Granted to the Knights Hospitaller by the count of Tripoli in 1144, Krak des Chevaliers became the epitome of fortified strength and power. At its apogee Krak could garrison 2,000 troops and was believed by many in the thirteenth century to be impenetrable to attacking armies.

Krak presents an interesting example of castle design in the Levant, as it was almost continuously being built and rebuilt over the course of the Hospitalers’ tenure. It was first remodeled when the knights took control of it, but improvements and design refinements continued throughout the thirteenth century, probably to within a few years of its capture by the Mamluk sultan Baybars in 1271. This ongoing work on the structure of Krak testifies both to its wealth and to the need for its continued military strength in the region. It also demonstrates an interesting amalgamation of castle design elements, including older square towers, the incorporation of round towers and half-round mural towers, concentric curtain walls,

(Courtesy Graham Loud)

and box machicolations (projecting galleries at the top of a wall or tower with openings in the floor through which missiles, burning pitch, and the like could be discharged).

Krak provides an interesting example of the various functions that a castle might serve. Not only important and effective as a defensive structure, it was used as an administrative center for the extensive lands under its control. Krak also functioned offensively as a convenient base from which the knights could raid their Muslim neighbors and enforce the collection of tribute.

—Laura Wangerin

to defending borders and controlling disputed territories, and as they increasingly became a regular landscape feature, sieges became the predominant way of waging war. In addition to providing important defensive capabilities, castles were also commanding symbols of the wealth and power of their lords. In time, some of them, especially in Europe, also became the centers of new towns that developed around them.

During the period 1000–1500, two factors drove changes in the design of Europe’s castles: the need to respond to technological innovations in warfare and the desire to incorporate certain practical elements observed in Byzantine and Near Eastern fortifications that were encountered during the crusades. The first Euro-

pean castles, appearing in the ninth and tenth centuries, were simple motte-and-bailey structures built of earth and timber. Although there was great variety in the execution of these fortifications based on the terrain and the needs of the garrisons defending them, they all had as common elements a wooden watchtower on a motte (a hill, or mound of earth) surrounded by a stockade to create an enclosure (the bailey). Most motte-and-bailey castles had dry moats dug around them as an additional defense. The greatest advantage to this style of fortification was that it was relatively quick to construct and therefore was useful in areas needing rapid fortification. Disadvantages were that it was susceptible to fire, siege engines, escalade (scaling the walls with ladders and other devices), and mining

techniques, all likely offensive elements in a siege. The logical consequence was that castles began to be constructed in stone.

The earliest stone castles in Europe, dating from the late tenth and early eleventh centuries, still followed the basic motte-and-bailey design of a tower surrounded by a walled enclosure. The tower was strengthened into a *donjon*, a massive square keep that could serve as a refuge if the outer fortifications were breached. These outer fortifications also became more complex, incorporating into the design elaborate earthworks, towers integrated into the curtain walls, gatehouses, and loopholes for archers. When possible, natural landscape features were used as part of a castle's defenses, including rivers, escarpments, and marshes.

The eleventh and twelfth centuries saw a flurry of castle building in Europe as a response to political instability and the development of a hereditary aristocracy interested in protecting fiefdoms and projecting military-political influence. Following his conquest of England, King William I (r. 1066–1087), for example, found that the realm contained fortified towns but few royal fortifications. Drawing upon his experience as the duke of Normandy, he undertook an extensive castle construction project in order to establish kingdom-wide authority. By the end of his reign he may have built as many as 500 castles throughout the country, the most famous of which is the present-day White Tower in London.

Frankish colonists in the crusader states also found castles useful for asserting and maintaining their control over newly conquered territories and securing strategically important frontier areas. Given their small numbers of men-at-arms relative to what their enemies could muster, they found castles particularly well suited to defensive warfare.

When the first crusaders arrived in the East in the late eleventh century, they found very few castles. Those they did encounter tended to have the Byzantine-Armenian design elements of round towers and curtain walls with semicircular flanking towers. Although it has been an issue of some scholarly debate, it is now generally agreed that when crusaders built castles in the Levant they relied far more on European designs than on Arab or Byzantine models, and their cas-

tles and fortifications in the East followed building trends occurring simultaneously in the West. This is not to imply, however, that the West was opposed to borrowing useful innovations in castle design. The increasing use in siege warfare both in the Levant and in Western Europe of the trebuchet, a counterweighted catapult with devastating force and accuracy, fostered one essential modification to castle design. Borrowing from the Byzantines and Armenians, European castle builders made the round tower the standard throughout Europe and the crusader states in the course of the twelfth century, effectively replacing the square donjon. Rounded surfaces were more resistant to trebuchet bombardment, as a hit was more likely to be glancing and inflict less damage. Round towers also were harder to mine and sap and had fewer blind spots, all advantages to a defending force.

An additional adaptation brought back to Europe with the crusaders was the incorporation of concentric designs into castle architecture, an innovation that reached its climax in the mid-to late thirteenth century. Concentric design elements could include multiple moats, concentric encircling walls of varying heights, and ditches. The most impressive example of this type of defensive fortification that the crusaders encountered was Constantinople's triple set of land walls. Any such concentric structure was sure to slow down a besieging army and at best could force it into a position whereby the defending garrison could attack it at an advantage.

In the fourteenth century primitive gunpowder technology began to be used in simple cannon, and in the fifteenth century castles were being built or modified both in defense of and to take advantage of developing gunpowder weaponry. Curtain walls were lowered to present a smaller target to siege ordnance. They were also strengthened to resist hits, and platforms were often added to towers so that cannon could be used defensively. Arrow loops were widened to accommodate defensive artillery. While there were specific adaptations made to account for the increasing prevalence of gunpowder artillery in sieges, as with earlier adaptations there was not a sudden revolution in castle design. The diffusion of architectural innovations was not rapid, and the spread of adoption was not uniform.

What is remarkable is how well and for how long traditional castle designs held up to the new siege technologies as they arose.

Siege Warfare across Eurasia

Siege warfare was an important element of small- and large-scale military conflicts across Eurasia throughout the period 1000–1500. A siege consisted of an armed offensive force surrounding a fortification with the object of forcing surrender by encirclement and blockade, bombardment, starvation, and other forms of harassment, stratagem, and deceit and, if necessary, direct attack.

In Japan, siege warfare first came into wide use during the eleventh century and by the twelfth and thirteenth centuries was standard practice. Unique to the Japanese, most defensive preparations for sieges in the Kamakura period (1186–1333) included plans for escaping by horse or by ship and fortifications tended to be defensive lines consisting of ditches, barricades of stacked brush, moats, and perhaps walls of packed earth, all with large gates that could be opened to allow mounted defenders to gallop out and attack. These fortifications were specifically intended to be temporary. By the Nambokucho period (1336–1392), although this defensive-line style of fortification was still being used, a new type of stronghold and siege style appeared in

Japan that more strongly resembled those on the continent, with garrisons occupying and defending permanent fortifications.

Land conflicts in Southeast Asia tended to focus on gaining control of strategically placed towns, often protected by substantial plastered walls with elaborate ditches, and thus the siege was central to waging war. Due to this area's unique geography and low population density, the goals of siege warfare in Southeast Asia included not only expansion of political influence but also the capture and resettlement of local populations.

The Chinese developed most of the siege weapons and techniques that became common throughout Eurasia during the period 1000–1500. China had seen the development of many new styles of war during the Warring States period (453–221 BCE), including those relating to sieges, and little changed in Chinese siege techniques and technologies even after the introduction of gunpowder artillery more than 1,000 years later. Mining and sapping, namely digging under walls in order to collapse them, were age-old techniques that continued to be used. To shield the men working at undermining the walls, armies built tanks or mobile sheds with protective roofs. The Chinese also developed crossbows and counter-weighted catapults as well as a host of other machines designed to weaken walls or throw rocks and incendiary devices over them. Ladders were often used if a frontal assault was to be attempted, albeit with the risk of heavy casualties.

In addition to cavalry, crossbowmen, and infantrymen able to perform the martial and manual labor that accompanied a siege, large numbers of specialized professionals were necessary. These included engineers to design and operate siege engines and expert craftsmen to construct them. This kind of specialized support remained crucial to the execution of a successful siege campaign throughout Eurasia.

By the thirteenth century much of China's siege technology had diffused into central Asia, the eastern Mediterranean, and Europe, where the proliferation of walled towns and small fortresses made siege warfare the primary form of engagement. The West also eagerly adapted Chinese gunpowder technology for siege warfare

➤ MONGOL SIEGES

A seventeenth-century Mongol chronicle reports that when Chinggis Khan (ca. 1162–1227) encountered his first Chinese fortified city, he devised a clever way to overcome it. Having surrounded the city, he asked the city officials for 1,000 cats and 10,000 swallows as the price to raise the siege. Once these had been delivered, he ordered that scraps of fabric be tied to their tails and lit on fire. The animals then all ran or flew home, and as the city burned the Mongols entered and conquered it. While the accuracy of the tale is doubtful, the central element—that Chinggis Khan's forces lacked experience with siege warfare—was a genuine problem for the Mongols. While there was never any question of the superior abilities of Mongol cavalry, the army was challenged by the increasing frequency with which it had to deal with fortified towns and cities as it pushed the frontiers of empire south into China and west into Persia, Russia, and eastern Europe.

The Mongols solved this problem by employing an age-old practice in a new way. Turco-Mongol armies had traditionally conscripted defeated soldiers into their armies in order to bolster their numbers. The Mongols now extended conscription to include engineers and artisans skilled in the building and handling of siege engines and military leaders experienced in the tactics of siege warfare, especially Chinese engineers and tacticians. Thus armed with people who could advise and supervise the various elements of siege warfare, the Mongols ensured that their military preeminence was not impeded by their own lack of familiarity with this style of waging war and were able to continue their conquests unabated.

—Laura Wangerin

when it became available in the fourteenth century, although it was another 100 years before it became a truly effective weapon of war. Although the Chinese developed some cannon at about the same time that the West was experimenting with gunpowder artillery, it is interesting that they did not refine this technology. When in the early modern era Europeans arrived in China with their guns and cannon, the Chinese were astounded by their efficacy and precision.

The Mongols also freely adopted and adapted the siege technologies of China in their thirteenth-century wars of expansion. The rapidity with which they were able to acquire expertise in deploying these new machines and tactics was devastating for the cities they besieged. Chinggis Khan (ca. 1162–1227) made his first venture into China in 1209. Over the course of the next several years the Mongols struck repeatedly at China, and by 1215 the effort had evolved from a looting campaign to a conquest. The experience gained

and the personnel acquired in the sieges of Chinese cities were applied to the subsequent subjugation of lands to the west. Although much has been made of the great bloodshed that accompanied the sieges of the Mongol invasions, it should be noted that whole-scale massacre was not an unusual fate for cities taken by force by either European or Asian armies. The Mongols clearly exploited this fearsome reputation, sparing cities that capitulated without resistance and massacring the populations of those that did not.

In the great invasion of Russia undertaken by Chinggis Khan's successors in the period 1237–1240, the startling efficiency of their approach becomes clear. The siege of Ryazan early in 1237 was over in five days. The attack on Vladimir began on the morning of February 7, 1238, after troops had been in place for four days, and was over by noon. The siege of Kiev in 1240, perhaps the most dramatic, saw the city completely surrounded by Mongol troops. Siege guns were used with great effect against the walls, and when they fell the fighting commenced, with the Mongols gaining control of the city after battling through the night. Contemporary Russian chroniclers writing about the invasion reported with awe and dismay the Mongols' advanced siege technology, including catapults and battering rams, as well as their sophisticated use of psychological warfare and the speed and skill with which they attacked.

The single siege of this time period that historically had perhaps the greatest implications for both the Asian and European worlds was the siege of Constantinople by the Ottoman Turks in the mid-fifteenth century. Byzantine emperors had for some time been trying to garner Western military support against the Islamic forces, which by then commanded most of Anatolia. The few allies they had managed to acquire to bolster their garrison at Constantinople were vastly outnumbered by the troops with which Sultan Mehmet II laid siege to the city in 1453. Over the course of nearly two months Constantinople held out while he wore down its defenses with a blockade, heavy artillery, siege engines, and sheer numbers. On May 29, 1453, the great walls surrounding the city were finally breached, and the city was sacked by the sultan's forces. The fall of Constantinople ended the Byzantine em-

pire and, with the expansive and effective use of gunpowder artillery as siege weapons by the Ottoman Turks, ushered in the beginning of a new military era.

War and Transport Ships around the World

Warships and the nature of naval warfare underwent spectacular change between 1000 and 1500, especially in Western Europe. Modes of sea fighting changed more in this period than in the previous 2,000 years. While developments in western Eurasia had the greatest ramifications, Chinese shipbuilders constructed vessels that incorporated a number of cutting-edge innovations.

In 1000 the most-feared warship in European waters was the Viking longship, a supple undecked vessel with low freeboard—that is, the distance between the waterline and the gunwale (the upper edge of the hull)—and a single mast setting a square sail for long-distance passages before a favorable wind but generally powered by oars, especially in battle. Size was indicated by the number of pairs of oars, one man per oar. Longships generally had between 13 and 23 pairs of oars, although “great ships” could have 25 pairs or more. With relatively flat bottoms, the

► DESIGN OF A HORSE TRANSPORT

Medieval shipwrights built different styles of ship in different places, but there was little functional specialization: the same vessels carried people, silks, spices, grain, fish, timber, livestock, and other animals, including horses and, in Asia, elephants. Ships that carried horses were fitted with stalls and tie-downs to secure the animals for the passage. Vikings carried horses from Norway to Iceland in *knarrs* in the ninth century, William the Conqueror ferried 2,000 to 3,000 horses across the English Channel in similar ships in 1066, and four authors of the thirteenth to fifteenth centuries—from Venice, Turkey, Persia, and China—describe the shipment of thousands of horses annually from Arabia and Persia to India.

The first horse transports built as such seem to have been Mediterranean oar-powered *tarides* or *uissiers*. French records from 1246 and 1274–1281 include detailed specifications for *tarides*. The earlier vessels measured about 118 feet (36 meters) long by 13 feet (4 meters) broad and carried 20 horses. The later ships were 125 by 16.5 feet (38 by 5 meters) and carried 30 horses in stalls three abreast and with slings under their bellies to prevent them from falling. The horses walked on and off the ships—sometimes mounted—on stern ramps measuring 12 by 4.8 feet (3.7 by 1.5 meters).

—Lincoln P. Paine

ships were run up on beaches for raids, but battles at sea were not uncommon. These opened with volleys of arrows and stones, but battle was joined when the ships were made fast to one another and the crews fought as they might on land. It was in such vessels that Vikings raided from Scandinavia to Britain, France, and Spain in the west and down the rivers of eastern Europe to the Caspian and Black seas. From the Black Sea and Atlantic Spain, Vikings also entered the Mediterranean from east and west.

The standard Viking cargo ship was the *knarr*, similar in form to the longship but shorter and with a lower length-to-beam ratio. The Vikings sailed these across the Atlantic to Iceland, Greenland, and Newfoundland as well as in their ordinary trade. As the Viking age ended in the

twelfth century, in the field of maritime commerce *knarrs* were replaced as northern European merchants devised altogether different kinds of ships: the hulk and the cog. Mounting a single square sail, they relied on oars only for auxiliary propulsion. The vessels were squat with a length-to-breadth ratio of only 3-to-1 rather than 4- or even 6-to-1, and they were much deeper in the hold, qualities that gave them a large carrying capacity well suited to traffic in bulky low-value goods like fish, grain, and timber. The lack of permanent navies in northern Europe meant that sovereigns depended on requisitioning merchant ships to engage in naval operations, so cogs became the model for warships. With greater freeboard, sailors in cogs had the advantage of being able to fire down on the enemy, especially when towering sterncastles and forecastles were added to the hull.

In the Mediterranean, oared galleys that had evolved directly from classical antecedents remained the standard ship of war. Unlike Viking longships, these usually had more than one man per oar, up to a maximum of eight. The weaponry was also more sophisticated, involving catapults and *ballistae* (crossbowlike artillery) for shooting arrows or hurling rocks and firepots. They also used lime to blind the enemy and soap to make them lose their footing. Mediterranean vessels also carried triangular lateen sails set parallel to the centerline of the ship. One of the earliest and most complete set of specifications for Mediterranean war galleys relates to the fleet of Charles I, the Angevin king of Sicily, in the 1280s. These vessels were about 130 feet (40 meters) long and 12 feet (3.7 meters) in beam (a ratio of nearly 11:1) and carried 108 oars. Whereas in antiquity and the early Middle Ages galleys carried one oar per bench—though frequently with more than 1 rower per oar—now there were three or more rowers per bench, each pulling his own oar. In addition to the oarsmen, these Angevin galleys carried 36 marines, 2 masters, 4 helmsmen, and 2 boys. The specifications also enumerate the different types and quantities of weapons, including crossbows, shields, lances, halberds, axes, helmets, padded jackets, vessels for holding combustibles, grapnels, and quicklime. The crews were generally

comprised of people with regional specialties: Sicilian oarsmen and Genoese or Catalan crossbowmen, for instance.

Two other significant differences between northern and southern shipbuilding traditions were the former's use of centerline rudders (starting about 1200), rather than steering oars or quarter rudders hung from the side of the ship, and the use of shell-first rather than frame-first construction. In the ancient shell-first shipbuilding technique, the hull of the ship was erected from the outside in: the hull planks were fastened to each other first, and frames or ribs were inserted to strengthen the form. In the early Middle Ages, Mediterranean shipwrights began to rely instead on frame-first construction and first erected the interior frames of their ships—the ribs coming off of the keel, like a skeleton—after which they applied the planks of the hull.

As the crusades drew increasing numbers of northern European mariners to the Mediterranean from the twelfth century on, shipwrights began to adopt and combine the most useful qualities of the two traditions. By the fifteenth century, this had resulted in the earliest fore-runners of the full-rigged ship-of-the-line, found in both northern European and Mediterranean waters: ships constructed frame-first, with two or more decks, a combination of fore-and-aft and square sails, and steered by a centerline rudder. They also grew substantially in size. The largest Venetian ship in 1400 had a capacity of about 400 tons. Half a century later there were six ships of 600 tons, and by 1500 Venice had a ship of 1,000 tons.

The early fourteenth century also saw the development of the first iron and bronze cannon in Western Europe, and within ten years of the earliest written evidence for cannon in Europe, they were being used aboard ships, in a French attack on Antwerp in 1336. Given their size and weight, bronze and iron cannon were well suited for use aboard ships. Initially, small-caliber anti-personnel guns were mounted on the stern and forecastles, but over time larger guns were carried on deck and fired broadside over the bulwarks or through holes cut in the bulwarks. Their incorporation had a dramatic effect on ship design and naval tactics; for example, mounting

guns below the upper deck required the development of watertight covers for gun ports—holes in the hull of the ship near the waterline—in the early 1500s.

By the 1470s, Venetian galleys were armed with heavy guns mounted in the bows on the centerline of the hull. (Oars and oarsmen made it impossible to mount guns broadside.) Such guns, powerful enough to sink a ship, would not appear on sailing ships for another half century. In a battle off Brest in 1513, a French galley squadron armed with large bronze cannon known as basilisks sank one English sailing ship and badly damaged another.

It is very likely that other seafaring peoples such as the Cholas of southern India, who sailed across the Bay of Bengal in 1025 to invade the Sumatra-based kingdom of Srivijaya, differentiated between ships used for war and those used for trade. But before the sixteenth century outside of Europe and the Mediterranean, the only people who have left clear evidence of purpose-built warships are the Chinese. In this period, Chinese ships were rigged fore and aft and mounted centerline rudders, an innovation that some believe may have inspired its introduction into Europe although the meager evidence is inconclusive.

The institution of a formal Chinese navy is generally credited to the Southern Song dynasty (1127–1279), which in the twelfth century created a standing fleet of 11 squadrons of ships fitted with gunpowder bombs thrown by catapults. The development of Chinese naval craft did not undergo as pronounced a metamorphosis in this period as did European ships, nor were the innovations brought to the same level of refinement as in the West. Many reasons for this have been advanced, but the most significant are the lack of foreign rivals of comparable ability and the fact that most of China's naval warfare was confined to inland waters—rivers, canals, and lakes—and the coasts rather than on the high seas. Most significant was the application of the human-powered treadmill-operated paddlewheel as the means of propulsion for warships, which gave them incomparable maneuverability. Originally developed in the eighth century if not earlier, paddlewheel vessels were extensively used

by the Southern Song, first in their campaigns against the Jurchen (Ruzhen) invaders of the twelfth century and later in the period of civil unrest that plagued the dynasty. The first Song paddlewheel ships carried either two or four eight-bladed paddles. Rather than build larger paddles for longer vessels, shipwrights increased the number of paddles, the largest being powered by 24 paddles and capable of carrying over 1,000 men on several decks. Because these ships had no need for masts and sails, their upper decks could be covered with iron plates to protect the soldiers.

Chinese tactics differed from those in western Eurasia in one crucial respect that antedates this period but was maintained throughout it. This was the use of a long spiked lever, the end of which could be dropped on enemy ships not to facilitate boarding but rather to keep an enemy ship at a distance so that it could be raked with fire by bombs or crossbows.

Mesoamerican War Strategy, Battle Tactics, and Armaments

The Indians of pre-Hispanic Mexico developed strategic war aims, battlefield tactics, and arms and armaments to suit the societies they created. Aztec warfare, as well as that of other neighboring polities and cultures, primarily aimed to capture but not kill opposing warriors, who would then be sacrificed to various deities. Whereas Eurasian armies developed well-organized and highly maneuverable infantry and cavalry formations, the Aztecs and their neighbors, as well as all of their predecessors, lacked close-ordered drill and instead stressed charges and individual combat designed to win prestige by acquiring sacrificial victims. They still, however, also fought for larger objectives, namely conquest and subjugation, as representations of stylized burning temples and tribute lists in the few extant Mexica codices (bound books) make abundantly clear.

The Aztec (or Triple Alliance) order of battle illustrates the height of pre-Hispanic arms and armaments in Mesoamerica. The Aztecs fielded armies as large as 100,000 to 200,000 fighting men, divided into 8,000-man units. Lightly armed scouts and skirmishers, carrying atlatl launchers and spears, preceded the more heavily armed main body of warriors. These warriors wore quilted cotton armor; carried painted, sometimes feathered, round shields; and employed razor-sharp obsidian-bladed clubs and knives as well as slings, darts, and other weapons to make war. The highest-ranked among them, including commanders and members of prestigious military orders, such as the Otomi who were named after an especially fierce tribe of neighboring Indians, and at times the emperor himself wore elaborate feathered costumes and sandals. The more elite the military order, the more elaborate the feathered costume. Reserve forces, including conscripted troops from conquered provinces, followed.

Such formations failed to survive Spanish battlefield tactics and arms and armaments during the conquest of Mexico. While the Aztecs'

obsidian-bladed club could and did decapitate horses, it proved too unwieldy and could not match the Spaniards' steel swords, which could parry, slash, and thrust, not to mention the Spaniards' determination to destroy and not merely capture their opponents in war.

Thought and Religion

The modern divisions of philosophy, science, and religion are largely meaningless when we discuss thought and religion in the period 1000–1500. Philosophers tended, more often than not, to be theologians or at least cosmologists (as was the case with the Neo-Confucians). Theologians tended to be philosophers, involving themselves in what today would be considered the philosophical branches of metaphysics, logic, and ethics. Science, as understood today, was then essentially a branch of natural philosophy, being essentially grounded in theory rather than empirical investigation. Of course, as any student of history is aware, such sweeping general statements as these must allow for exceptions. As entries in the section on “Science and Technology” indicate, medicine in the Chinese, Indian, Arab, and Western traditions was founded both on theory and clinical experience, even though the former outweighed the latter. Moreover, astronomy was based on observation of the skies.

Another distinction to keep in mind is that doctrine and theological speculation do not sum up the totality of religion. Religion is not only belief. It is also practice, and probably for the vast majority of humans who professed adherence to a religious tradition during these 500 years, doctrine was largely inconsequential, or at least it took a distant second place to the religious practices that informed one’s life. Entries for the theme “A World on the Move” already have highlighted one of the major religious practices common to so many religions around the world: pilgrimage to sacred spots. Ritual, whether it was pilgrimage, prayer, fasting, the performance of various acts, or the wearing of special clothes, tokens, and amulets allowed the devotee to feel connected to both a deity or spirit and to a community of like-minded individuals.

In addition to the religious traditions that offered articulated canons of belief, such as the various forms of Buddhism, Christianity, and Islam, to name but three great traditions among many, there were what we might term traditional religious practices that often lacked clearly formulated bodies of doctrine but did have their myths—often origin myths—and, more important, practices that brought meaning, solace, and a sense of right order to their practitioners. One example is the various blessings and purgative ceremonies performed by Diné, or Navaho, singers, persons often mistakenly called “medicine men.” Many of these traditional ways of relating to and touching the Beyond fell within the category of what are loosely termed animist religions that were based on the belief that spirits possess every manner of being, and humans must establish a proper relationship with these spirits as protection against evil and in the hope of a good life. The Ari people of southwestern Ethiopia, for example, believed (and still do) that each person is

The Ari people of southwestern Ethiopia, for example, believed (and still do) that each person is created by a personal deity, either a male Sabi or female Beri.

created by a personal deity, either a male Sabi or female Beri. Moreover, these deities can come to dwell within the person whom they created, and when that happens these divine spirits need to be accorded other dwelling places, normally trees or bushes, and require regular sacrifices.

In this theme we will first explore the search for the Divine Other around the world, seeing how both the so-called world religions and traditional religions that were confined to a single culture or people functioned and in some cases originated and spread. When we use the term “world religion,” no value is attached. Such religions are not superior to traditional religions practiced by a single folk. Quite simply, a world religion, such as Buddhism, Christianity, and Islam, is one that offers a universal message, claiming to be valid for all peoples everywhere, and that travels from its place of origin to new cultures and from them to other cultures. In the process of this complex transit, it is not only adopted by its hosts but is also adapted by them to their ways of life. That is, it is integrated more or less comfortably into these cultures through a process we term *syncretism*. This is not a one-way process. A new religion, especially one that has already evolved a complex set of beliefs and practices, will force compromises and changes in lifestyle and mind-set on its new adherents. Thus, for example, Ibn Battuta who traveled through the West African empire of Mali in the early fourteenth century was edified to see young boys being trained to memorize the Quran in Arabic, and those who failed in this endeavor were chained. At the same time, however, he noted that Muslim native women were, in his estimation, shamefully free in their friendships with male friends, something that would not be tolerated in his Moroccan homeland.

As we shall also see here and elsewhere, world religions were often at loggerheads with one another. Thus, Christians and Muslims fought holy wars against one another, and during these centuries Turkic Muslims were the single most important factor in the virtual disappearance of Buddhism from much of Central Asia and North India, regions where it had flourished for over a millennium. Major world religions, because of their claims to universal Truth, also tend to see religious doctrine in terms of right and wrong, truth and falsehood, orthodoxy and heresy. Indeed, for many devotees of such religions, heresy, the supposed perversion of the truth by a person who professes to be a member of that faith, is far worse than unbelief. What is more, one sect of a religion often ascribes to members of a variant sect the basest of motives, morals, and behavior, juxtaposing the rectitude of true believers and the perversity of apostates. For these reasons, Shias and Sunnis have often been at odds and war with one another, and, in like manner, Christians who follow a majority form of the faith have often persecuted the minority “heretic Christians” within their midst. Even supposedly nonviolent Buddhists have oppressed “deviant Buddhists.”

Philosophical schools also have their orthodoxies, and within the Islamic and Latin Christian worlds of this period no philosopher was more preeminent than Aristotle, a fourth-century BCE Greek thinker

whose thought was largely preserved by Muslim scholars and passed on to the West through Muslim and Jewish scholars, philosophers, and (if we may make the distinction) theologians. But Aristotle was more than some long-dead philosopher. He had articulated a highly organized system of logical analysis, metaphysics, ethics, and natural philosophy (to name only the most significant areas in which he worked and wrote), and Muslim, Jewish, and Latin Christian theologians who were exposed to his brilliant and startlingly original ideas were forced to come to terms with his theories and modes of analysis, either trying to integrate them into their own doctrinal traditions or articulating reasons for rejecting them (and in the process often using Aristotelian logic and terminology to refute him and those who espoused the philosophy of this pagan).

Two of the most significant fields in which Aristotle worked were social and political philosophy, or ethics and political science. As he noted, the human is by nature a social animal. These 500 years were noted for an outpouring of original work throughout Afro-Eurasia in these allied branches of philosophy. Some of it clearly showed the imprint of Aristotelian influence. Toward the end of this era, some social and political thinkers in Western Europe were also exhibiting the influence of the recently discovered (as far as the Latin West was concerned) Plato, the teacher from whom Aristotle so radically deviated. Some of it was quite independent of Greek philosophy, the most striking example being the Neo-Confucianism of Song China.

It is tempting and partially correct to see these 500 years as a prelude to the great religious and ideological movements and changes across the globe of the three centuries that followed. Yet to treat these five centuries as simply a precondition for what followed is to fail to see the inherent importance that religion and thought in all their forms played in the lives of human beings around the world between 1000 and 1500. The great nineteenth-century German historian Leopold von Ranke wrote that “Every age is immediate to God” (*“Jede Epoche ist unmittelbar zu Gott”*), by which he meant that the historian must understand every era on its own terms and seek to perceive its inherent logic and meaning without reference to what follows, for no period of human history is inferior to what comes next, nor does it exist to usher in its antithesis or an improvement upon itself. Nowhere is this dictum more appropriate than when we study the religion and thought of this epoch.

—Alfred J. Andrea

■ Introduction: The Search for the Divine Other

To call the period 1000–1500 an “Age of Faith,” as it is often termed, is to reduce a complex half millennium to a single facet, and such reductionism does grave disservice to history. That noted, almost countless varieties of religious experience and expression were alive

and flourishing during these five centuries. Faith outweighed unbelief many times over, and religion, however expressed, was accepted by most people as a normal part of life. For most persons, it was a form of security in this life and preparation for death and the Beyond. In those cases

where there was no concept of a personal after-life, it nevertheless defined one's place in the universe and put one right with spiritual forces.

The large number of entries under this topic suggests the importance of religion and spirituality during this half millennium, but cumulatively they give only a tantalizing taste of its many religious currents and movements. They do not even hint at the origins of two important movements that began in the most humble manner during the last years of the fifteenth century and only became significant phenomena during the following century and beyond. The more important of the two was the introduction of Latin Christianity, also known as Roman Catholicism, to coastal Africa, into the Americas, into South Asia, and onward to East Asia due to fifteenth-century Portuguese and Spanish voyages of discovery and exploitation. By the end of the sixteenth century, the globalization of Christianity was a reality that would have lasting world historical significance. The second movement that originated toward the very end of the fifteenth century was confined to India, but there it took on great importance and has remained so to the present. This was Sikhism, a monotheistic faith that originated in the Punjab and today is embraced by over 25 million believers. According to Sikh tradition, its first guru, or teacher, Nanak (1469–1538), experienced his initial prophetic revelation in 1499 and began preaching the path of a single God who was neither Hindu nor Muslim.

Of all of the religious developments that took place during these five centuries and were noticeable to those who took care to take notice, the two most significant were the continued spread but also partial retreat of Islam and the simultaneous spread and retreat of Buddhism.

After 1000 CE Islam, almost exclusively in its Sunni form, made major advances into six areas of Afro-Eurasia: Africa, western Central Asia, Anatolia and the Balkans, eastern Central Asia, India, and coastal Southeast Asia. In addition, the large non-Muslim populations in regions conquered in the seventh and eighth centuries, such as Egypt, Syria, and Iran, were progressively turning to Islam, although significant non-Muslim minorities in these lands remained faithful to their traditional religions.

The only area in which Islam was in retreat was the Iberian Peninsula where, in the face of the Reconquista, Muslim states progressively fell to Christian crusader forces from the mid-eleventh century to 1492, when Granada, the last Muslim bastion, was swept away by the Catholic monarchs of Spain, Fernando of Aragon and Isabel of Castile-León. The bitter choice of forced conversion or migration for Muslims and Jews followed upon the heels of this final Christian victory.

In Africa, Islam took deep root in sub-Saharan West Africa, overwhelmed Christianity in the area south of Egypt that is present-day Sudan, and even advanced somewhat at the expense of Christian Ethiopia. Islam also advanced farther south along the East African coast, finding welcoming homes in the Swahili cities. In all of these areas, as well as elsewhere across Afro-Eurasia, Islam merged with local traditions. Moreover, as in lands that had become part of Dar al-Islam (the House of Islam) many centuries earlier, the process of converting the masses, especially rural masses, was far slower than the process of converting elites who more readily perceived the advantages of becoming Muslims.

In western Central Asia, Islam continued a process begun in the seventh century, with progressive displacement of Zoroastrian, Buddhist, and Assyrian Christian enclaves in such areas as present-day Afghanistan, Uzbekistan, Kazakhstan, and adjacent lands during the period 1000–1250. In the eleventh century, recently converted Seljuk Turks began the slow process of transforming Byzantine Anatolia into a Muslim Turkic region, and the process was completed, at least politically, under the Ottoman Turks, although large minorities of Greek, Syrian, Armenian, and other Christian groups remained an integral part of Anatolian society until the early twentieth century. The Ottomans also began the conquest of that area of southeastern Europe known as the Balkans, although the majority of persons living there under Ottoman rule remained Christian. Islam also made major inroads into Central Asia east of the Pamir Mountains, a region today that is the Uyghur Autonomous Region of Xinjiang, China. Originally Manicheans and Buddhists, the Uyghurs, the single largest Turkic group in this

vast area, slowly converted to Islam as the religion spread from west to east between the late tenth and seventeenth centuries. By 1000 CE, Kashgar in the far western regions of eastern Central Asia was already a Muslim town, and by 1500 Islam was a major force throughout most of Central Asia.

There was, however, a temporary countervailing trend. Beginning in the eleventh century, a number of Turkic and Mongol tribes residing alongside and within the northern and western borders of imperial China converted to Christianity, the brand of Christianity practiced by the Assyrian Church of the East, with its spiritual center in Iraq. These were the so-called Nestorian Christians whom Marco Polo and many other Latin Christians from the West encountered in Central Asia and China in the thirteenth and fourteenth centuries. These conversions were made all the easier because Assyrian Christian missionaries tolerantly allowed converts to maintain many of their customary beliefs and practices, thereby creating a Turco-Mongol-Christian synthesis that Friar William of Rubruck remarked upon in the mid-thirteenth century. Because a number of Mongol khans were married to Christians or had Christian mothers, counselors, and generals, these Christians fared well under the Mongol empire. Indeed, under the Mongols, the Church of the East was able to expand its reach throughout China, establishing churches far to the south. At the same time, a significant number of Assyrian Christian Turks were “converted” to Latin Christianity by Franciscan friars, who arrived in the late thirteenth century and following and were likewise tolerated by the Mongol emperors. Most notable among the Ongut Turk converts was a king known as George. This association with the hated Mongols was also a curse for Christianity, inasmuch as following the Yuan dynasty’s collapse in 1368, the Christian Churches in China, both Assyrian and Latin, withered away in the face of Chinese hostility under the Ming to anything foreign. There is no evidence of persecution in the form of martyrdoms, but by 1400 both churches were largely things of the past in China and fast dying out. Meanwhile, Assyrian Christians along Ming China’s borders were converting to either Islam

or the Tibetan-style of Tantric Buddhism now espoused by the Mongols of eastern Central Asia.

The Mongols had initially been the greatest challenge ever to Islam in western Asia, greater even than the crusades, as the capture and sack of Baghdad in 1258 bore witness. By the end of the thirteenth century, however, the Mongol il-khan of Persia had embraced Islam, and the Mongols of western Central Asia were fast becoming Muslims. Under these Muslim il-khans the Assyrian Christian Church experienced some sporadic persecutions in the early fourteenth century, but it was nothing compared to the destruction wrought by the conquering armies of Timur-i Leng (Tamerlane). Amir Timur, a Muslim Turk who claimed legitimate authority derived from the Mongols’ Chagatai khanate of western Central Asia, was not only a would-be world conqueror but also a self-conscious *ghazi* who waged war against infidels, even though many of his campaigns were against fellow Muslims. Regardless of his attacks on coreligionists, his campaigns often assumed the guise of holy wars against Christians of every type, including Georgians, Armenians, and Assyrians. Churches were destroyed, and populations were killed off or enslaved. By the time of Timur’s death in 1405 and a loosening of his anti-Christian policies by his Timurid successors, the Assyrian Church of the East had been severely diminished. It has, however, survived to the present.

Islam had a presence in India since the seventh century, when Arab-Muslim merchants established themselves and constructed mosques along its Malabar, or southwestern, coast, and in the eighth century Arab armies conquered Sind in present-day Pakistan. Islam, however, only became a permanent presence in the northern heartland of India, the Indo-Gangetic Plain, with the successful expeditions out of Afghanistan of a Turkic *ghazi* known as Mahmud (or Muhammad) of Ghazni, who during the last quarter of the twelfth century conquered a number of key cities, including Lahore and Delhi. Following his assassination in 1206, one of his generals established the sultanate of Delhi, which was ruled by successive Turco-Afghan dynasties from 1206 to 1526. The sultans of Delhi followed various policies in regard to their non-Muslim subjects,

at times persecuting and at other times tolerating, with different levels of benevolence, Hindus, Jains, Buddhists, Parses (Zoroastrians), and even a handful of Christians. Although non-Muslims remained a majority, great strides were made in conversion to Islam because of a multiplicity of factors, including the attraction of its egalitarianism, as opposed to the fairly rigid Hindu caste system, and the spirituality of Sufi mystics, which struck a resonant chord among a people who revered holy people.

Sailing from India, Arabia, Iraq, East Africa, and elsewhere, Muslim merchants were becoming an increasing presence in the rich coastal cities of Southeast Asia, where they established diaspora communities from which the process of conversion began. Sufi missionaries and Muslim merchants combined to convert local leaders and others, as a hybridized form of Islam took root that combined traditional Muslim practices with native customs. By 1500 the islands of present-day Indonesia, as well as Malaysia on the Malay Peninsula, were on their way to becoming the demographic heartland of the House of Islam, as they are today with their combined populations of more than 240 million Muslims.

Mainland Southeast Asia also experienced a major infusion of Theravada Buddhism during these centuries. Mahayana Buddhism had already been part of the religious landscape of Southeast Asia for many centuries, with tradition ascribing its origins there to missionaries dispatched by King Asoka (r. ca. 269–232 BCE) of India's Mauryan empire. In the late thirteenth century, however, Ram Khamhaeng the Great (r. 1279–1298) established Theravada Buddhism as the state religion in the Sukhothai Kingdom, a forerunner of present-day Thailand. Whereas earlier Mahayana forms of Buddhism had coexisted alongside the worship of Shiva in the Khmer kingdom of what is today Cambodia, after the thirteenth century Theravada Buddhism became the state religion due to influences from Ceylon (Sri Lanka), where Theravada Buddhism has dominated down to today. What followed in Cambodia was mass conversion to this form of Buddhist search for Enlightenment. The story was much the same for all other mainland areas of Southeast Asia in the late thirteenth and fourteenth centuries except for northern Vietnam, where Mahayana Bud-

dhism prevailed because of strong influences from China.

Likewise, Ming China (1368–1644) experienced a close relationship between the state and the Mahayana Buddhist *sangha*, or community. Indeed, due to imperial patronage, Chinese Buddhism, which had strong Daoist, Confucian, and Tantric elements woven into it, experienced a renaissance in Ming China.

Tibet's form of Buddhism, which had ancient roots, was largely a multifaceted variant of Mahayana Buddhism known as Vajrayana (the Thunderbolt Vehicle) and also known as Tantric, or Esoteric, Buddhism. During the eleventh century it spread from Tibet to various peoples of eastern Central Asia, and in the late thirteenth century it took root among the Mongols of China's Yuan dynasty. From that time forward, Tantric Buddhism has dominated Mongolia's religious landscape, even as many of its Turkic neighbors turned to Islam.

While these revivals were taking place, Buddhism was largely passing from the scene in northern India, its homeland, due to Turkic Muslim destruction of most of its monastic centers, and also in many areas of Central Asia, especially its western regions, due to the rising tide of Islam.

So, although it is simplistic to call these five centuries an Age of Faith, there is no exaggeration in stating that this half millennium experienced profound religious developments.

—Alfred J. Andrea

Major Indigenous Religious Traditions of Sub-Saharan Africa

A great variety of words have been used by observers of sub-Saharan Africa to define the nature of the continent's religious traditions. They include animism, paganism, polytheism, fetish, primitive religion, superstition, and juju, to name just a few. Most of these characterizations say more about how those outside of Africa have sought to define Africa's spiritual history than the actual nature of Africans' belief systems. Indeed, most of these terms do more to denigrate African religious systems than they do to help others understand the diversity and the complexity of the spiritual and moral universe that Africans have long inhabited.

It is necessary, first, to note that a great variety of religious traditions existed in sub-Saharan Africa during the period 1000–1500. Indeed, there were probably as many distinct religious systems as there were languages, which means hundreds at least and perhaps over 1,000. These systems varied according to the lifeways and particularities of the local populations. Sedentary agriculturalists, for example, often have different concerns from those of pastoralists. However, at the same time, it is possible to address certain general themes that can be used to describe most indigenous sub-Saharan African religious systems.

In general, most indigenous African religious systems then and now were pantheistic but with a monotheistic twist in that the Entire Divine, or all that is sacred, was believed to be encompassed by a single High God. That High God, however, is so powerful and incomprehensible as to be inaccessible to all but the most extraordinary of individuals. For example, among the Nyamwezi people of Tanzania, to even speak the name of the High God is to risk spiritual disaster. In order to bridge the gap between the High God and the living, almost all African religions have a class of intermediate deities who specialize in specific spiritual tasks. Some might be elemental deities, such as of lightning, or tied to certain places, such as a forest or a river. These deities were and are perceived to be emanations of the High God but accessible to human needs. Most African religious systems also have had a deity who specializes in communication with oracles and diviners and another “trickster” god whose job it was to constantly test the morality of the living.

Human beings can interact with the divine in a number of ways. Priests, priestesses, and other religious specialists have long enjoyed special relations with the particular deities to which they are devoted. Oracles and diviners have for centuries specialized in trying to determine the will of the divine and proper human actions. Notably, a central element of many African religions was (and is) the belief that individuals could be chosen by deities and provided with special insights or powers through spirit possession. Rituals, sacrifices, and prayer, whether in the context of special holidays (such as the harvest) or day-

➤ THE YORUBA CREATION STORY

The Yoruba story of creation was passed down as an oral tradition for generations. It relates that in the beginning the world was a great marshy waste, which was visited occasionally by the gods. One day the Supreme God, Olorun, decided to create solid land, and he asked Orisa Nla, the head of the lesser deities, to spread earth upon the marsh. After Orisa Nla had created land, Olorun provided seeds for the planting of trees. Among these was the oil palm, a tree that produces oil, edible fruits, and wine and was critical to human sustenance in the heavily forested region.

Finally, Olorun instructed Orisa Nla to form humans from clay so that he could bring life to them. The first humans settled at *Ile Ife*, a city that thrives today in southwestern Nigeria and that Yoruba traditionalists still hold to be the original home of humanity.

—Jonathan T. Reynolds

to-day life, provided individuals then and now with the ability to interact with the divine. Notably, the belief that moral individuals join the divine as Ancestors following death meant that their descendants could call upon them, as well as more powerful deities, for assistance in life.

The Continued Spread of Islam in Sub-Saharan Africa

The expansion of Islam in sub-Saharan West and East Africa during the period from 1000 to about 1500 built upon contacts with the wider world that had initially been established via long-distance trade across the Sahara and via the Indian Ocean. During the early ninth century, communities of North African and Middle Eastern Muslims had established themselves in urban centers in the Niger River region of West Africa

and along the East African coast. Beginning in the eleventh century, contacts between these merchants and urban populations began to result in conversions of local populations to Islam.

The process of conversion was interesting in that it tended to take place first among elites, in the persons of rulers and merchants. For example, the ruler of the empire of Ghana reputedly converted to Islam in 1076. Indeed, particularly in West Africa, Islam during the period from 1000 to 1500 is often referred to as a religion of court and commerce. Many scholars have identified these conversions as being driven by economic considerations, suggesting that the desire to expand trade relations with North Africa motivated West African rulers and merchants. While economics are always influential, other factors should also be considered. Rulers and merchants often inhabited worlds that were cosmopolitan and multiethnic. As such, they may have found Islam's universal message appealing in the face of local religions that seemed less adapted to an expanding and increasingly socially complex world.

The conversion of rulers and merchants, however, did not necessarily demand a transformation of the region's religious mores. Most rulers practiced something called dual kingship in that they practiced Islam in the cities and traditional religions when touring rural regions. Such a move may well have been based on the ruler's pragmatic awareness that divorcing themselves from local systems of belief would substantially undermine their legitimacy. Thus, growing connections with the wider world demanded that these rulers carefully balance local and trans-regional constituencies.

The pilgrimage of Mansa Musa in 1324–1325 represents something of a turning point for West African Islam. Mansa Musa was the ruler of the empire of Mali, and by the time of his reign it was not unusual for political elites in the savannah region to be Muslims. Mansa Musa, however, took the remarkable step of setting out on a pilgrimage to Mecca, a journey of thousands of miles that took two years to complete. This trip shows a growing embrace of Islam and also highlights just how big the world of a West African ruler could be at this time. Notably, Mansa Musa's focus was not only on his own spiritual develop-

ment but also on that of his people. He returned from his pilgrimage with thousands of books (according to the sources, he had some 5,000 subjects accompany him on his journey) as well as a group of Islamic scholars and architects, whom he had hired to help foster the practice of Sunni Islam in the region. The scholars helped found the Sankore madrasa at Timbuktu, which eventually grew to be one of the greatest academies in the Islamic world. The architect Ibrahim al-Sahili, who originally hailed from Muslim Spain, also returned to Mali with Mansa Musa and helped found the Savannah Style of mosque architecture for which the region is now famous. Mansa Musa's actions set the stage for a much more formal and state-supported practice of Islam in the region. In East Africa, the ease of movement between the coast and maritime regions of the Middle East helped foster similar conversions among local rulers and merchants.

Notably, those who converted to Islam did not necessarily see themselves as converting to a foreign religion. The rulers of Mali, for example, developed a mythology that they were descended from Bilali Bunama, one of the companions of the Prophet Muhammad and the first muezzin of Medina and Mecca. Similarly, the founding myth of the Hausa city-states (in present-day Nigeria and Niger) reports that a "prince from Baghdad" traveled to the region and fell in love with a local queen, and the children from their union went on to found the region's cities. Further, through a process of syncretism, many elements of local religious belief were intertwined with Islamic elements.

A particularly powerful force in the indigenization of African Islam was the increasing influence of Sufism. Sufi saints in particular were believed to have the power to intercede with God on behalf of their followers, and after their death their tombs often became sites of pilgrimage. Thus, Sufis saw these tombs as sacred spaces that were both Islamic and local.

Together, the expansion of Islam among urban populations and the growing state investment in Islam meant that by the latter part of the fifteenth century, Islam had become an established part of life in the West African savannahs. The influence of Sufism and the growing syncretism between Islam and local religious beliefs

were also setting the stage for a second wave of Islamic expansion into rural areas, a development that would take place over the next several hundred years.

The Continued Advance of Islam and the Retreat of Buddhism in Central Asia and North India

The arrival of Islam in Central Asia and North India spelled the death for Buddhism there, as it not only brought a dynamic religion into both regions but also coincided with the arrival of the Turks. Islam proved to be a dynamic and expansive religion that replaced Buddhism as a competitor against Brahminical Hinduism, which emphasized caste differences. Both Buddhism and Islam served as alternatives to the caste system, as both religions viewed all people as equal in religion. But Islam had the advantage of being the religion of the conquerors, and by converting to Islam one could increase one's opportunities. In addition, various Muslim Sufi groups introduced a syncretic form of Islam to North India and Central Asia that focused on knowing and loving Allah (God) over rite, law, and ritual. This allowed many Hindu traditions, festivals, and holy sites to remain in place but cast in an Islamic light.

Muslim influence in India began when an Arab army conquered the Indus Valley region of Sind (in present-day Pakistan) in 711–713. Subsequently Abbasid armies entered Central Asia, defeating armies of the Tang empire at Talas in 751. With the implantation of Islamic forms of law and government, many of the elites converted to Islam to ensure their privileges, while others, including some Buddhists, resisted conversion but

found acceptance as *dhimmis*, or “tolerated non-believers.” For Buddhism, the Muslim victory at Talas was perhaps the more significant event. If the Tang armies had won, Central Asia might have remained a vital pilgrimage route from China to India. Under Islamic rule, however, the number of pilgrims and resident Buddhists declined, as they were not allowed to proselytize. In addition, by the tenth century Sufi missionaries found success in many areas of Central Asia.

Perhaps the most aggressive individual in expanding Islam in Central Asia and North India was Sultan Mahmud of Ghazna (998–1030). A brilliant military commander, he made 17 invasions into India from his base in Afghanistan. His armies roved across much of modern Pakistan and northern India, reaching as far as Gujarat. His primary targets were the wealthy Hindu temple complexes, such as the one he destroyed at Somnath during 1025–1026. Although he sanctioned all of his actions under the guise of jihad, the fact that he rarely occupied territory south of the Hindu Kush Mountains indicates that his primary goal was to extract wealth. Nonetheless, as his actions were primarily against non-Muslims, the Abbasid caliph and his own subjects viewed him as a defender of the faith. Furthermore, he established a tradition that lasted for centuries: using Afghanistan as a base of operations to plunder India.

In the twelfth century the Ghurid dynasty (1173–1215) replaced the Ghaznavid dominance. By 1192 the Ghurid territory stretched from the Hindu Kush Mountains to Delhi. After their empire collapsed from external pressure, a Ghurid general named Qutb al-Din Aybeg conquered Delhi and established the sultanate of Delhi (1206–1526). From Delhi the sultanate extended its rule over Gujarat and Rajasthan and into the Deccan. Despite the advance of this Islamic state, the majority of the population remained Hindu.

With the steady advance of Islam in western Central Asia, Buddhism declined, not primarily through bloody engagements but gradually over the centuries, until it essentially disappeared. To be sure, some rulers sought to convert by the sword, as happened when the formerly religiously tolerant Mongols converted to Islam in the western regions of Central Asia that were encompassed by the Chaghatayid khanate and the

➤ HOW SIGNIFICANT FOR BUDDHISM'S WANING IN INDIA WERE THE DEVASTATIONS BY TURKISH MUSLIMS?

Although the Turkic invasions were destructive, their role in Buddhism's waning in India can be overstated. The most significant challenge for Buddhism was the lack of a political patron. Since the collapse of the Mauryan empire (ca. 323 BCE–ca. 185 CE), a strong Buddhist state did not exist in India, where subsequent states tended to be almost exclusively Hindu. Although Buddhism continued to have appeal and transregional connections with East and Central Asia, the lack of state patronage hindered the growth of shrines and especially monasteries, the institutions that brought the faith and its ritual practices into the lives of laypeople.

To be sure, Buddhist temples and monasteries were plundered and often destroyed in the course of various Turkic invasions and at the command of some rulers. But more Hindu temples suffered more damage than all the Buddhist structures combined simply because most of the cities had Hindu majorities. But Hinduism in all of its many forms persisted and even flourished in northern India, while Buddhism essentially died out. Hindu temples were simply too numerous to eradicate. But beyond that, the very nature of Hindu worship insulated it from total destruction. Buddhist monasteries and temples were the focal points of Buddhist worship and learning. Without them, Buddhism largely withered away. The various varieties of Hinduism, however, suffered less falling away of devotees because the home was the traditional center of Hindu worship.

—*Timothy May*

il-khanate of Persia. There many Buddhists and others were given the choice to leave or convert. Yet by and large, the process of Islamization was evolutionary, as syncretism transformed old traditions into Islamic forms and their origins faded in memory.

As evinced by the now-destroyed Buddhas at Bamiyan (Bamiyan), Afghanistan, and the great Buddhist cave and grotto complexes farther east in the western reaches of China, Buddhism had had a vibrant presence for many centuries throughout Central Asia. There was a brief re-

surgence under the Qara Khitan empire (1126–1219) and then under Mongol rule, but with the western Mongols' aforementioned conversion to Islam in the late thirteenth and early fourteenth centuries, it ended in the regions west of the Pamirs. Temples and monasteries were converted to mosques and Islamic charitable institutions, just as Christian (and other) sites of worship had been in the early centuries of Islamic expansion. The process was slower in eastern Central Asia (largely present-day Xinjiang, China) but no less complete, thanks to the embracing of Islam by various Turkic peoples there. The exception was Mongolia, which remained firmly Buddhist. The same was true in Tibet, whose Lhamist Buddhism was adopted by the Mongols of Mongolia. Indeed, the current line between the Buddhist and Islamic worlds in Central Asia follows roughly along the same borders that separated those thirteenth- and fourteenth-century Mongol khanates that accepted Islam from those who converted to Buddhism.

In India the process was more complex. Buddhism remained steadfast, particularly in eastern Bengal and in the foothills of the Himalayas. Elsewhere in India, conversion to Islam did not completely eradicate Buddhist practices and beliefs, but they slowly dwindled among the population. The syncretic qualities of Sufism enabled many Buddhists to convert to Islam without significant changes to their cultures or daily lives. Combined with the establishment of an Islamic state and the introduction of Islamic symbols at the local levels of government, increasing numbers of the commoners in northern India, Buddhism's original homeland, and Bengal converted to Islam.

This process of Islamization was further aided by official inertia. Muslim rulers were prohibited by the dictates of their faith from promoting any other religion. No temples or monasteries received state patronage, and most Muslim rulers even prohibited the erection of new Hindu and Buddhist places of worship by local devotees. Moreover, repairs to existing physical structures were left to the local population, if they were allowed at all. In case of war or natural disaster, destruction could be so substantial as to be beyond the meager resources of the villages to repair.

The Turkic Christians of Inner Asia

According to the Syriac writer Bardaisan, there were already Christians in Bactria (present-day northern Afghanistan and bordering areas) by the late second century. Between the fifth and seventh centuries, the Syriac (also known as Assyrian) Church of the East (mistakenly called Nestorians) appointed bishops and metropolitans (archbishops) for the cities of Merv, Herat, and Samarkand. Around 550, the Hephthalite Huns became the first of several nomadic tribes to receive a bishop after their ruler requested one from Catholicos (Patriarch) Mar Aba I.

Arabic, Byzantine, and Syriac chronicles testify to the presence of Christians among both the Central Asian Turks and their neighbors, the Iranian-speaking Sogdians (located largely in present-day Uzbekistan), from the sixth century on. An anonymous seventh-century Syriac chronicle describes how Elia, Metropolitan of Merv, converted a Turkic king and his army around 644, and Catholicos Timothy I (r. 780–823) mentions his appointment of a metropolitan for the Turks around 782, again at the request of their ruler.

Archaeological finds also provide evidence of a vibrant Christianity that preceded the seventh-century Arab invasions of Central Asia and continued to endure even after the area became largely Muslim. These include crosses inscribed on coins, ossuaries (caskets for preserving bones), pots, and rock cliffs, as well as Christian churches and monasteries unearthed in Turkmenistan, Uzbekistan, Kyrgyzstan, and Xinjiang, China.

From Central Asia, Syriac Christianity moved northward and westward. Sogdian traders along with Syriac and Persian clerics and monks carried the faith into China as early as the seventh

century. Many Christian texts—written in Syriac, Sogdian, and Old Uighur—have been discovered in Dunhuang and Turfan, sites in western China to which the Uighurs fled after their empire was overthrown by the Kirghiz in 840. These texts show how Christianity was able to thrive alongside Buddhism and Manichaeism in an atmosphere of religious plurality and tolerance that was typical of many pre-Islamic Turkic states.

With the rise of the Persian Samanid dynasty in Bukhara in 875, Christianity began to wane in Transoxiana (the land between the Oxus and Jaxartes rivers, today known as the Amu Darya and the Syr Darya). The Persian historian Nārshakhi records the conversion of churches in Bukhara and Taraz (Talas) into mosques, and Sufi legends describe military expeditions against Christian rulers of various towns and cities. However, although Transoxiana was largely Muslim by the turn of the millennium, Christians could still be found in Khwarezm (located south of the Aral Sea) as well as in major cities such as Samarkand. Moreover, so-called Nestorian missionaries and merchants continued to carry the faith north into the steppes.

Syriac and Christian Arabic chronicles describe a large-scale conversion of Central Asian Turks, probably the Keraites, in 1007–1008. Two centuries later, after Chinggis Khan conquered them, intermarriage between Mongol rulers and Kerait princesses became common practice. The most famous example is Sorqaqtani, a Christian Kerait princess who became the mother of three Mongol rulers: Mongke, Khubilai, and Hulegu. At some point, the rulers of another Turkic group, the Onguts, also adopted Christianity. As loyal allies of the Mongols, they too intermarried with the family of Chinggis Khan.

Although the Keraites and Onguts were the only Turkic groups with Christian rulers, archaeological finds, Muslim historians, and later European travelers show that Christianity was also present during this period among a number of other Turkic groups dwelling across the northern steppe and into northwest China, including the Oghuz, Qipchaqs, Kirghiz, Qarlucs, Uighurs, Naimans, and Merkits. Of particular interest are the Qipchaqs, called the Cumans in Western sources. One of their constituent tribes, the Qun,

➤ YAHBALLAHA III AND RABBAN SAUMA

The fourteenth-century Syriac *History of Mar Yahballaha* tells the story of two Turkic Christian monks, Rabban (Master) Bar Sauma (1230?–1294) and his disciple Marcos (1245–1317), who traveled the Silk Road from east to west in the late thirteenth century. Both went on to play important roles in the Mongol il-khanate of Persia. Although the Syriac writer Barhebraeus called them Uighurs, they were probably Ongut Turks.

The *History* describes how they decided to leave China around 1275 on pilgrimage to Jerusalem. Upon their arrival in 1279 in present-day Azerbaijan, they learned that the road to Jerusalem was not safe, so they stayed in Mongol territory where the catholicos (patriarch) of the Syriac Church of the East, Denha I, made Marcos metropolitan (archbishop) of China and Sauma visitor general.

When Denha died in 1281, Marcos was elected catholicos in his place, adopting the title Yahballaha III (r. 1281–1317), the first and only catholicos who was not Syriac or Persian. His election was largely due to his knowledge of the language and customs of the Mongol rulers. During his time in office, he served a total of eight Mongol il-khans, eventually seeing Christianity fall from favor after the conversion to Islam of Ghazan Khan in 1295. However, prior to that when the Mongols were actively seeking an alliance with Europe against the Mamluk rulers of Egypt, Marcos played an important role in promoting the status of Christianity under the Il-khanids.

In 1287 Yahballaha and Il-khan Arghun jointly dispatched Rabban Sauma to the pope and the rulers of the Christian West in an effort to seek

support for the Mongol campaign to capture Syria and Palestine from the Muslims. Rabban Sauma visited Constantinople, Naples, Rome, Tuscany, Genoa, Paris, and Bordeaux speaking with European rulers and church leaders and viewing churches, shrines, and relics. He was questioned by the cardinals in Rome about whether his patriarch recognized the authority of the pope, and he discussed the possibility of a Mongol-Western alliance with Philip IV of France, served communion to Edward I of England, and celebrated mass with Pope Nicholas IV in Rome.

Arghun was so pleased with the mission that he had his son baptized and promised to be baptized himself when the Mongols captured Jerusalem. Subsequent Mongol embassies were dispatched in 1289 and 1290, but apart from short missionary visits by a few Dominicans and Franciscans in the period 1288–1291, the papacy did little in the way of follow-up, and the kings of France and England did nothing due to their preoccupation with European affairs.

After Arghun's death in 1291, most il-khans were either weak and ineffectual rulers or devout Muslims who persecuted Christians. Rabban Sauma died in 1294, but Yahballaha continued to lead the Church for another quarter century, during which time churches were destroyed and Christians were massacred in Maragha and Arbela. After years of service, including a time of imprisonment and torture under Ghazan Khan, Yahballaha said, "I am weary of serving the Mongols" and retired to the monastery he had built in Maragha, where he died in November 1317.

—Mark Dickens

are described as "Nestorian Christians" by the Muslim historian Marvazi (ca. 1120). Although we do not know when they converted to Christianity, later writers (including Michael the Syrian and Ibn Battuta) refer to the Qipchaq-Cumans as Christians, and the *Codex Cumanicus* documents the efforts of Franciscan missionaries among the Cumans in the fourteenth century. Records of the Church of the East further indicate several additional metropolitans (archbishops) during Mongol times, including Turkestan, Kashgar, and

probably Almaliq (the latter two in present-day Xinjiang, China).

Mongol rulers were well known for their tolerance of many religions among their subjects. Perhaps due to the dynastic links with the Keraits and Onguts, Christianity was especially favored by the grand khans in Mongolia and the Yuan dynasty founded by Khubilai Khan in China. Their general presence and their influence as advisers, generals, and even governors were recorded by both European travelers to the East

(especially John of Plano Carpini, William of Rubruck, Marco Polo, and John of Montecorvino) and Muslim historians (notably Juvayni and Rashiddudin).

Christians could also be found in the other Mongol khanates: the Chaghatayid khanate, the Golden Horde, and the il-khanate of Persia. They were initially favored above Muslims in the il-khanate, and there was even a Turkic patriarch, Yahballaha III, of the Church of the East in the late thirteenth century. However, life for Christians in these khanates grew more difficult after the ruling classes converted to Islam in the late thirteenth and early fourteenth centuries. Evidence of the initial flourishing and then gradual decline of Christianity at this time can be seen in the hundreds of Christian gravestones, engraved in the Syriac script, found near Lake Issuk-Kol, Kyrgyzstan. As a result of plague and persecution after the Mongol ruling elite outside of Mongolia and China became Muslims, Christian communities in Central Asia gradually died out.

Largely in response to the Mongol invasion of eastern Europe, the Church of Rome organized missions to Mongol territory in the mid-thirteenth century. Their purpose was twofold: to gather information that would be useful to the pope and other European rulers and to convert the Mongols and their subjects to Latin Christianity. For a short time, Franciscan and Dominican missionaries experienced limited success in Central Asia and China, and in the fourteenth century Catholic bishoprics were established in Samarqand, Khwarezm, and Almaliq. In 1339 several Latin missionaries in Almaliq were martyred, including the bishop, Richard of Burgundy. The changing political situation that accompanied the spread of Islam in Mongol territory outside China and Mongolia proper and the fall of the Mongol Yuan dynasty in China in 1368 subsequently resulted in the persecution and eventual disappearance of the remaining Turkic Christians, whether Syriac or Latin. Although there were still some Christians left in Samarqand during the time of Amir Temur (also known as Timur-i Leng, or Tamerlane, r. 1370–1405), references to them cease soon after, ending a presence of nearly 1,000 years in Inner Asia.

Fatimid Shia and the Origin of the Druze

The Druze religion and Shia Islam share many links and attributes. In fact, the links between these two faiths were so strong that many (even into the latter part of the twentieth century) often identified the adherents of the Druze faith as Shia Muslims or less egregiously as some hyphenated hybrid. We may assign much of this confusion to a simple lack of knowledge, but much of it may also be deliberate dissimulation practiced by the Druze themselves. Within this veil of secrecy, the Druze have thrived amid the hills of Lebanon, Israel, and Syria, yet little is known of their religion and its origins. As a result, many myths and legends have attached themselves to this faith over time, obscuring this movement's true history and aims.

The Druze (as an independent group) enter history during the reign of the Fatimid caliph al-Hakim (r. 985–1021), who seems to have been a caliph of great extremes: capable of great

► THE CALIPH AL-HAKIM

The Shia Fatimid Caliph Abu Ali al-Mansur, known by his regnal title al-Hakim bi-Amr Allah, remains a figure shrouded in mystery. He appears in the historical records as an arbitrary ruler with fits of extreme cruelty toward almost all religious groups, including the Sunni Muslims of his lands. It has been argued that he presented no systematic approach to his administration of Egypt, imposing sumptuary (dress) laws and then relaxing them and fixing commodities' prices as if on a whim. Indeed, he is rather indelicately referred to as the "Mad Caliph" in some sources.

Of all the features of al-Hakim's reign, his pro-Shia measures are arguably the most important. The caliph was universal in the application of his edicts against Sunni Muslims, Christians, and Jews. For instance, it became law for all Christians and Jews to wear black turbans, and it was illegal for them to ride on horseback. In 1009 al-Hakim ordered the demolition of the Church of the Holy Sepulcher in Jerusalem, the site believed by Christians to be where Jesus was crucified, interred, and resurrected, and this would help spur Pope Urban II (r. 1088–1099) to call for a crusade at the Council of Clermont in 1095. However, the caliph was unusually tolerant of apostasy, allowing people who converted to Islam to return to their former religions. This uneven historical policy and his tolerance for a cult of personality have led many to question the historical record on al-Hakim bi-Amr Allah.

—*Rasheed Hosein*

patience and forbearance and at other times of wanton cruelty and intolerance. He was the perceived heir to the temporal and spiritual authority of Ali according to a particular branch of the Shia sect known as the Ismailis and ruled Egypt as the Fatimid caliph from the age of 12. During his lengthy reign this caliph did many noteworthy things, such as stopping East Roman (Byzantine) expansion under Basil II (r. 976–1025) and bringing Syria fully under Fatimid control. However, his reign was also the scene of brutal persecutions directed at minority religious groups within his realm.

His legacy presents posterity with a confusing and contradictory image. Indeed, even his

final day as caliph was problematic. On the evening of February 27, 1021, the caliph rode out into the desert, ostensibly to meditate, and never returned. This would allow some people within Fatimid Egypt to hold the heretical belief (according to basic Islamic principles) that the caliph was in fact divine and would return as part of a modified Islamic eschatology surrounding the last days. These believers in the divinity of al-Hakim would refer to themselves as the *al-muwahhidun* (the people of unity) and survive today principally amid the hills of Lebanon and Syria under the title of the Druze.

The notion of *taqiyyah* (dissimulation before unbelievers), derived from Shia Islam as a defense against Sunni persecution, colors everything we know or think we know about the Druze. Perhaps we may ascribe the *taqiyyah* of the Druze as a form of self-defense as a result of going to the public with a radical new take on religion and then being forced to silence. However, this practice rapidly began to define the Druze as stories gave way to legends, and myths began to surround the faith, forming an almost impenetrable barrier. Only recently, with a more liberal policy of toleration shown in the Druze homelands and a diaspora of sorts taking Druze adherents to the liberal democracies of Europe and North America, have the Druze begun to emerge from isolation and reveal aspects of their faith to the world.

Generally, there are three major theories on the nature of the Druze religion. The first claims that the Druze faith is a Zoroastrian-Islamic hybrid. Persianized Arabs moved into the region in waves beginning around the time of the Prophet Muhammad through the reign of the first Umayyad caliph Muawiyah (r. 661–680). The dualism of Zoroastrianism explains the contradictory actions of al-Hakim, as both the embodiment of good and evil were housed in one man. The second theory is that the Druze faith marks a return to a more unitary concept of the deity. While we have no record of al-Hakim sanctioning his veneration, it is clear that he did not discourage it. Thus al-Hakim was worshipped not as a religiously inspired imam but as the living God of the people who would become the Druze. The third is the theory of existent pairs as embodied by the roles of the first major figures of the faith,

Darazi and Hamza. Darazi embodied inner truth (*tawili*), and it is from Darazi that the Druze would derive the name of their movement. Hamza was the patient helper (*wali*). Hamza claimed to be the imam, elevating al-Hakim to the role of deity (*al-Bar*). This notion of pairs was an established element in Islam's notion of prophethood, as each Messenger, or major prophet, had a helper. Together, both would help to define the religion of the Druze, and within a century of Hamza's death, the faith would close ranks and allow neither conversion into nor adherents leaving the faith.

Saivism in Tamil India

The worship of Sri (Lord) Shiva is of great importance in India. This is especially true in the case of southern India and particularly Tamil Nadu in India's extreme southeast, where for centuries Saivite saints, who came from every social level, caste, and *jati* (occupational sub-caste), were among the region's most creative elements, especially in their contributions to hymnology and worship ritual.

Known as *nayanmars*, these Saivite saints were great poets, composers, and devotees of Shiva, and it is generally accepted that they did not use devotion for commercial gain. Among those who stand out in their contribution toward the revival of Saivism and the development of hymns of devotion to Sri Shiva are four early saints: Appar (Father), who lived during the seventh century CE; Sundarar, who probably lived in the eighth century; and the two great hyperlexics (precocious children), Thirugnanasambandar (or Sambandar) and Adi Sankara. According

Chidambaram Temple in present-day Tamil Nadu, dedicated to the god Shiva. (iStockPhoto)

to tradition, Appar converted the great Pallava emperor Mahendravarman I (r. ca. 600–630) from Jainism back to devotion to Shiva after curing him of an illness. Sundarar, who according to tradition was transported to Heaven on an elephant dispatched by Shiva, referred to himself as “the servant of the Lord’s servants,” a title that coincidentally echoed the title “servant of the servants of God” that was adopted by the popes in faraway Rome around the year 600 (but we can only speculate about possible connections).

It is interesting to note that all of Adi Sankara’s works are in Sanskrit, not Tamil, and that his birthplace was Kalady in Kerala on the Malabar, or southwestern, coast, far from Tamil Nadu. His teachings had a more philosophical content than the highly emotional, or affective, hymns of nayanmars such as Sambandar. It is true, however, that the prodigious and precocious Sambandar was as much a scholar in Sanskrit as he was in Tamil, in which we are told that he left an estimated 10,000 hymns of which 4,232 have survived, even though he died, probably in the seventh century, while still in his teen years. Adi Sankara, who probably flourished in the eighth century, acknowledged Sambandar’s contribution to Saivism by referring to him as *Dravida Sisu* (Tamil Child) in his *Soundaryalahari* (*Succulence of Beauty*).

By the time of the Imperial Cholas (ca. 848–1279), the Saivite sect was vibrant and highly productive. Many kings and princes of the Chola

► THE POETRY OF NAMBI ANDAR NAMBI

Here Nambi Andar Nambi sings of a mystic experience of Sundarar.

“Servitor to the servitors of our Lord Thirumoolan (Shiva) am I’

Sang Sundarar.

The Lord who entered the body of the tender Of the herd of cows of Sathanoor of long established families;

He who praised in perfect Tamil, the Lord with a sickle moon on his head (Lord Shiva),

Exactly as in the words of the Vedas eternally prevailing on earth;

He who made his feet rest on my head.

He is the compassionate one called Moolan.”

—K. Sethumadhavan

Source

Periyapuranam, by Sekkizharr (Saint, twelfth century CE), Abridged translation by Ramakrishna Math, 1984. First published translation into English, 1750.

clan, themselves leading devotees of Shiva, were mentored by Saivite teachers. King Raja Raja I (r. 985–1014) had as his mentor the great saint Karuvurar Devar, and Raja Raja’s son Rajendra I received his *deeksha* (spiritual initiation) from a certain Sarva Siva Pandita.

Among the greatest of Saivites who lived during the Chola imperial period was Nambi Andar Nambi, who revised and expanded upon the work of Sundarar. A contemporary of Raja Raja I, Nambi Andar Nambi was born to affluent parents in Chidambaram. The story has it that as Raja Raja set upon himself the task of discovering the hymns called *tevarams* that were composed by nayanmars, he came to know about the devotion of the young Nambi Andar Nambi and with the child’s help was able to trace the hymns to the cupboards at Chidambaram temple. Nambi Andar Nambi was an erudite scholar who could sing the praises of various devotees hailing from different sections of society and those who lived in different centuries under the patronage of different kings. Nambi Andar Nambi’s works are known also for their riveting details. Thus, he is

as much known for his poetic skills as for his unflinching devotion to Shiva.

The rule of the Imperial Cholas was a golden period for Saivism. As a significant development, the newly discovered *tevaram* hymns were reinstated for worship at Chidambaram Temple during the reign of Raja Raja I. A group of 48 singers would chant the hymns daily and received a small gift of rice weekly for their work. The construction of the temple known as Raja Rajeswaram (Shiva worshipped by Raja Raja) was another great achievement. Among the other noted works on Saivism during the period were *Siddhanta Saravali* (*Stream of Expositions*) by Trilochana Sivacharya in Sanskrit and the *Periya Puranam* (*Detailed Legend*) comprising lives and works of 63 canonical nayanmars by the scholar Sekkizhaar.

Diaspora Jewish Theologians and Philosophers

Some of the most influential figures in Jewish religious thought, such as Maimonides, Rashi, and Judah ha-Levi, flourished in the so-called High Middle Ages. Major works written in this time include classic commentaries on the Hebrew Bible, philosophical works, Halakhic (Jewish law) compilations, and poetry.

Commentary on biblical texts is almost as old as the Hebrew Bible itself and can be found in the Dead Sea Scrolls, in rabbinical homilies (midrash), and elsewhere. However, systematic commentaries that follow the order of the verses and attempt to explain problems in each and every verse began only in the Middle Ages. The earliest commentaries were written in Arabic or Judeo-Arabic (Arabic text written in Hebrew letters) by Saadia Gaon (882–942) in Abbasid Iraq and tenth-century Karaite (Followers of Scripture) exegetes, who were also located within the Abbasid caliphate.

The most prominent exegete, whose commentary is considered authoritative to this day, is Rashi (1040–1105), a Hebrew acronym for Rabbi Shlomo Yitzhaqi. Rashi, who lived in Langedoc (today southern France), wrote a commentary on all the books of the Hebrew Bible and also on the Talmud. His commentary is characterized by its brief nonallegorical notes on biblical verses in which he explained in a straightforward manner difficult words or discrepancies in the text. Like other traditional commentators, he tended to rely on rabbinical midrash as a source for solving textual problems. In some cases he explained difficult words by providing their equivalent in his contemporary French, thus making his commentary a source for scholars of Old French.

Many other commentators wrote systematic glosses on the Bible during this period, some on all the books of the Bible and some only on the books of the Pentateuch (the first five books of the Bible, also known as the Torah, or Law) or books selected for their interest. Abraham Ibn Ezra (1089–1164) of Spain was a mathematician and philologist whose commentary is characterized by philological discussions on the meanings and origins of words. Another great philological exegesis was that of David Kimhi (Radak, 1160–1235) of France, the most prolific commentator of a family of exegetes. (We also have commentaries of his father and brother.) This family tradition was not uncommon. Rashi's grandson, Shmuel son of Meir (Rashbam, 1080–1160), like his grandfather, offered brief straightforward commentaries, which are known in Hebrew as Peshat. A different kind of exegesis can be found in the works of Moshe ben Nachman (Nahmanides, 1194–1274) of Spain, a mystic who believed that Scripture has hidden meanings and should not be read only at a literal level. But he generally did not provide the presumed hidden meanings, only hints.

Jewish philosophy in this period should be viewed against a political and religious background. At the height of the crusades and the struggles between Christian and Muslim powers, Jews were forced to defend themselves theologically. Indeed, they were compelled to explain, to themselves and others, why they did not convert to the religion of the majority, either Christianity or Islam. Consequently, the body of Jewish

apologetical and polemical literature from this period is rich.

Two major works, both influential in Jewish thought to this day, are characteristic of the times. *The Kuzari* by Judah ha-Levi (1075–1140) is an imaginary dialogue on religion between a Jew (named “The Friend”) and the king of the Khazars. The king eventually acknowledges the superiority of the Friend's arguments and converts, together with his kingdom, to Judaism. The subtitle of the book, “In Defense of the Shamed and Despised Religion,” reflects the polemical

and defensive mind-set of Jews at that time who felt and often were oppressed. The book's main arguments are that God's commandments are designed to elevate humanity to a higher moral level. Since the Jews have preserved a record of sacred history that is accepted by both Christians and Muslims, their teachings and practices have a longer tradition and are more authentic.

The other major philosophical work of the time is *The Guide for the Perplexed* by Moses ben Maimon (Maimonides, 1135–1204). Maimonides, a physician who lived in Islamic Spain and later in Egypt, was a great legal and religious authority, which is reflected in his traditional sobriquet “The Great Eagle.” His philosophy was deeply influenced by Aristotle, mainly through neo-Aristotelian ideas mediated through Muslim philosophers such as Ibn-Sina, Al-Farabi, and Ibn Rushd.

In the book, Maimonides emphasizes God's transcendence by denying him any attributes. That is to say, any characteristic attributed to God will belittle him, since God is beyond any human understanding. Hence, one cannot describe God as “wise” or “strong” because these are human qualities. In order to explain biblical anthropomorphisms regarding God, Maimonides stresses that the Bible should be read allegorically. He maintained that the Bible was written in a way that could be understood by the people of its time and that its literal meaning does not

Maimonides was a leading Jewish philosopher and intellectual of the Middle Ages, and one of the outstanding physicians of the time. (National Library of Medicine)

➤ EPISTLE TO YEMEN

The *Epistle to Yemen* was composed by Maimonides to the Jewish community in Yemen in 1172 in response to questions presented to him by Jacob, son of Nethanel al-Fayyumi, in the name of the Jews of Yemen. This community was suffering great pressure and persecution by their Muslim neighbors. These persecutions led some Jews to convert to Islam and also led to high messianic expectations. Al-Fayyumi sought guidance from Maimonides on these issues, both on theological and practical levels. Maimonides' response indicates that Jacob's questions centered on maintaining faith in an age of hardships and included such queries as how one recognizes the Messiah and whether the Jewish community should accept back someone who converted to Islam out of fear but wishes to return to Judaism once the danger has passed.

Maimonides' response was a long treatise with implications for Jewish theology in general, not just the Jews of Yemen. Mindful of its greater application, Maimonides concluded the Epistle by writing: "I beg you to send a copy of this missive to every community in the cities and hamlets, in order to strengthen the people in their faith and put them on their feet. Read it at public gatherings and in private."

Throughout the Epistle, Maimonides stressed the importance of faith and the validity of the revelation at Sinai, arguing that the truth of God's word cannot be confirmed or refuted by miracles. Maimonides considered the truth of the Books of Moses to be evident and the divine revelation at Sinai to be historical due to the fact that the whole community participated in it. He also warned against calculating the time of the Messiah according to astrology but encouraged the people to continue hoping for the Messiah in their suffering.

Maimonides did not consider Jews who converted to Islam out of fear to be true apostates. He argued that Islam is closer to Judaism than Christianity by virtue of its uncompromising monotheism, whereas Christianity is not strictly monotheistic due to the doctrine of the Trinity. Scholars today believe that this is a stance construed from the fact that he was then living in a Muslim society—Ayyubid Egypt—and that under different circumstances he might have pointed to shared elements between Judaism and Christianity.

Isadore Twersky, *A Maimonides Reader* (New York: Behrman House, 1972), 461.

reflect its true ideas. He also did not accept prophecy, understood literally as a genuine manifestation of revelation. Instead, he considered the philosopher the model of the true prophet of God. *The Guide for the Perplexed* is considered in Jewish orthodoxy to be an ambiguous book, on the borderline of heresy. Some have contended that if it were not for the authority of Maimonides in Jewish law, the book would not have survived.

His other major work, *Mishne Torah* (*The Further Law*), is a code of law in which he ventured to collect all the law embedded in the Talmud and to determine the law in all cases left ambiguous in the Talmud. His stated aim was to close any disputes over legal issues in order to crystallize Jewish law. Though disputes did not end with this book, it became a major source of reference and citation for rabbis through the ages. One final contribution of Maimonides to Jewish

philosophy was his formulation of the 13 principles of the Jewish faith, including monotheism, prayer, the authority of scripture, and the coming of the Messiah. This formulation, which also reflects a response to interreligious polemics, has become part of the Jewish liturgy.

In stark contrast to Judah ha-Levi's and Maimonides' attempts to conceptualize the Jewish faith in the context of contemporary philosophical trends, there was also a rising interest in mysticism. One of the major works of Jewish mysticism, the *Zohar*, was compiled in thirteenth-century Spain. *Sefer Chassidim* (*Book of the Pious Sect*), a composition of the twelfth century that reflects the customs of a Jewish group in Germany (called Chassidei Ashkenaz, or the "Pious of Germany"), also includes various mystical references.

The literary production of Jewish philosophers and theologians of the period was vast

and diverse. It encompassed a wide geographic range (and several languages, including Hebrew, Arabic, and Middle High German) and a wide range of ideas expressed in various genres: biblical commentaries, philosophical treatises, and legal codes. It was not uncommon at the time to be skilled in more than one discipline. The philosopher Judah ha-Levi was also a poet and wrote both liturgical and religious poetry as well as secular love songs. Ibn-Ezra, known for his exegesis of the Bible, also wrote poetry in addition to his interest in philology and mathematics. Maimonides, trained as a physician, included health advice in his legal writings.

Buddhism—From Court to Commoner

The Kamakura period (1185–1332) was a turning point in Japanese Buddhism, highlighted by the spread of Buddhism among the illiterate commoners and by a new spirit of realism in religious imagery. The period gave birth to new and reformed Buddhist movements—Pure Land, Zen, and Nichiren—each devoted to the salvation of common people and stressing pure and simple faith over complicated rites and doctrines. Prior to this Buddhism was largely the faith of the imperial court, upper classes, and monastic orders.

Why the Kamakura era? First, decades of social unrest had culminated in the victory of Minamoto Yoritomo (1147–1199) and his establishment of the Kamakura shogunate in 1185. The emperor's authority was thereafter overshadowed for nearly seven centuries. Second,

simplicity and frugality became the watchwords of the new military class, replacing the perfumed embroidery of the court and the intellectual elitism of the entrenched monasteries. Third, manliness was prized over scholarship, and the physical and mental vigor of the individual became the keynote of Japanese feudal life. Thus arose the idea that any man, from any class, might climb to power by employing his mind and energies.

Religion fell naturally under the same leveling impulse, as did secular art. Monks appeared who walked among the common folk preaching simple faith, in particular Saigyō (d. 1190), Shinran (d. 1262), Nichiren (d. 1282), and Ippen (d. 1289). There were antecedents to be sure, notably the popular monk Kuya (903–972). The Saint of the Common Folk, Kuya had also walked among the masses, praying constantly to Amida Buddha for their salvation and their rebirth in Amida's Western Pure Land, a spiritual paradise where the souls of departed devotees were reborn to pursue the path to eventual enlightenment.

These missionary monks did not appeal to the court, established Buddhist powers, or nobility to help spread their teachings, and this attracted both dissatisfied clergy and the lower classes. Another factor underpinning Buddhism's popularization was a widespread belief in the "Three Periods of the Law," a concept of society's rise and fall that originated much earlier in Indian Buddhism but came to prominence later in China and then Japan. It foretold of the world's ultimate decay and the complete disappearance of Buddhist practice. The Japanese believed that the third and final period, the Age of Mappō (Decline of the Law), had begun in 1052. The ensuing decades, moreover, were marked by civil wars, famine, and pestilence. A sense of foreboding thus filled the land, and people from all classes yearned for a gospel of salvation.

The Jōdo (Pure Land) sects came to prominence in this era, although Jōdo faith was practiced in Heian times by Japan's court and monasteries. Japan's popularized Jōdo sects were founded by Hōnen (Hōnen) Shōnin (1133–1212) and his disciple Shinran (1173–1262). Both taught that anyone, whether noble or peasant, could gain rebirth in the Pure Land by faithfully reciting the name of Amida Buddha. The

► THE BUDDHIST IMPACT ON THE ARTS IN THE KAMAKURA ERA

The popularization of Buddhism had a profound impact on religious art and architecture. It sparked a new spirit of realism in sculpture. Unkei (d. 1223), the most brilliant Japanese sculptor of the early thirteenth century, infused temple statuary with humanistic vitality, and his school is credited with such innovations as using crystal eyes in Buddhist statues. Unkei's surviving sculptures are still prized today as the peak of greatness in Japanese Buddhist statuary. Portrait sculpture and portrait paintings of prominent monks and people were also innovations of the Kamakura period, with the Zen sect in particular pursuing this form of expression.

The great popularity of Jodo faith transformed temple architecture, as the small ornamented sanctuaries of earlier times had to be vastly enlarged in size and simplified in furnishing to accommodate much larger congregations. The Jodo faith also led to the predominance in religious art of three deities: Amida for the coming life in paradise, Kannon for assistance in earthly life, and Jizo for release from the torments of hell. These three remain the bedrock of Buddhism for the commoner to this day. Their effigies are found throughout Japan, and hundreds of pilgrimage routes have been developed. The most widely known Kannon pilgrimage covers 100 sites. Making the circuit is said to save believers from hell and to open the gates to everlasting life.

Giant metal statue of Amida Buddha at Kōtoku-in Temple in Kamakura, Japan, thirteenth century. Measuring over 37 feet in height, the statue is known as the Kamakura Daibutsu (Big Buddha of Kamakura). (Mark Schumacher)

Kannon legends are particularly widespread in Japan. One states that Minamoto Yoritomo, the founder of the Kamakura shogunate, always carried a small statue of Kannon under his helmet (inserted in his hair topknot) during battle. Another says that an amulet containing the *Lotus Sutra* (the key scripture in Japan underpinning Kannon belief) deflected an arrow and thus saved the life of Kusunoki Masahige, the most celebrated samurai of the early fourteenth century.

—Mark Schumacher

popularity of Jodo faith among commoners was a serious challenge to the institutionalized Buddhist monasteries in Kyoto and Nara, which attempted to block this popularization by proclaiming it subversive to public order. They prevailed upon the government to have Hōnen exiled to Shikoku Island. In 1211 he was pardoned and returned to the capital, only to die two months later.

Shinran, in particular, provoked Buddhist authorities by declaring that meat eating and matrimony were not contrary to the Buddha's teachings, even though the reigning Buddhist sects forbade both practices among clergy. Shinran was expelled from the monastic community for taking a wife. He further angered the establishment by declaring the Amida faith alone as

sufficient for salvation, other Buddhist deities and practices being unnecessary. In later years his followers extolled the virtues of religious practice among the laity and argued that a spiritual secular life was just as valid as a monastic life. Indeed, the monastic ideal was discarded. The sect's priests stopped shaving their heads and started dressing in ordinary clothes. They did not consider themselves enlightened but instead considered themselves to be part of a community of seekers. Today, Hōnen's school (Jodo) remains monastic, while Shinran's sect (Jodo Shin) is purely a lay Buddhist group, one of the largest in Japan.

Zen Buddhism also gained tremendous favor during the Kamakura era, although it too, like Jodo faith, entered Japan via China in earlier

centuries. The monk Eisai (1141–1215) sparked a great flowering in Zen's popularity from his base in Kamakura. He taught that personal enlightenment was not found in sutras or rituals. Rather, it was found within the self through meditation, restraint, and self-reliance. Zen attracted the samurai in particular and infused the arts with new life.

Nichiren (1222–1282) was the last of the great Kamakura-era teachers. He was a radical reformer who once studied at the powerful Tendai monastery on Mt. Hiei, as did Hounen, Shinran, Eisai, and other noted monks. Nichiren vehemently disagreed with the new Jodo sects and proclaimed both the old and new Buddhist movements to be false religions. He preached in the streets, hoping to revive the purity of the Tendai faith in the *Lotus Sutra*. He believed that faith in the *Lotus Sutra* alone would bring liberation and that recitation of the phrase “Hail to the *Lotus Sutra*” was the sole path to salvation.

He was exiled to remote locations twice but after a few years was released on both occasions. According to his own account, he was to be executed in 1271 while on the way to his second exile but was miraculously saved by the *Lotus Sutra*.

The new schools of the Kamakura era broke through the eclecticism and elitism of Japan's earlier Buddhist orders. By allowing the common people to enjoy worldly benefits with the promise of salvation in the afterlife (or enlightenment in this life), the new Kamakura sects gained widespread popularity. These movements, however, did not consolidate their gains until the Muromachi era (1392–1568). Today, the Jodo Shin, Zen, and Nichiren movements remain the most popular schools of modern Japanese Buddhism.

Eisai and the Triumph of Zen Buddhism in Japan

The Buddhist monk Eisai, or Yosai (1141–1215), has been credited with establishing Chinese Chan Buddhism in Japan, where it became known as Zen Buddhism (Zen is derived from Chan, meaning meditation). In fact, Zen was likely present in Japan as early as the late seventh century, but Eisai was instrumental in laying the foundation for Zen's becoming Japan's preeminent form of Buddhism with his establishment of the Rinzai school, one of Japan's two major sects of Zen Buddhism (the other being Dogen's Soto school). Rinzai took hold among Japan's Samurai, or warrior, elite during the fourteenth and fifteenth centuries when it enjoyed the patronage of the Ashikaga shoguns and was supported by the government, because its austere forms of mental and physical discipline fit so well the social and political agendas of the shogunate. The triumph of Zen also had a profound impact on Japanese culture, especially the arts, including architecture, poetry, ceramics, painting, calligraphy, gardening, the tea ceremony, and flower arrangement, and numerous crafts, such as sword-making.

Born in 1141 into a family that practiced traditional Shinto forms of worship, Eisai was sent off to study with a Buddhist priest. At age fourteen, he began his career as a monk of the Tendai sect, a school of Buddhism imported from China during the late eighth century. Tendai, a branch of Mahayana Buddhism, teaches that all sentient beings possess the buddha-nature and can become enlightened by discovering this inherent nature within themselves, especially through study of the *Lotus Sutra*.

➤ DOGEN, ZEN'S OTHER FATHER

Dogen (1200–1253), the most significant Japanese Buddhist of the thirteenth century, established the Soto school of Zen Buddhism, after a successful trip to China. Second only to Eisai in the role that he played in establishing Zen Buddhism in Japan, Dogen advocated a pure Zen that was devoid of elements of esoteric Buddhism common in earlier Japanese sects of Buddhism and in Eisei's Rinzai practices. In a desire to offer enlightenment to all, he opened his monastic communities to everyone regardless of intelligence, social status, sex, or profession. He also abolished the separation between laity and monks and adopted only the Mahayana religious precepts as necessary.

Unlike Zen Buddhists of some schools, Dogen accepted scriptures, arguing that an enlightened mind was free to elucidate and use the scriptures. He accorded a secondary importance to *koans* (enigmatic statements made by past masters that were used in meditation), although he did not reject them. For Dogen, the primary mode of practice was *zazen* (seated meditation). His writings on seated meditation contained a spirit of urgency because he believed that, since human beings have had the luck to be born with a human body necessary to achieve liberation, it was foolish to waste one's life.

—Carl Olson

Eisai traveled to China in 1168, where he studied Chan Buddhism and brought back texts for the further dissemination of Chan doctrine and practices. He went on a second trip to China in 1187, with the intention of traveling to India and its holy sites, but ended up staying in China. There, he studied Chan in greater depth and gained a seal of recognition for spiritual attainment and approval to teach it. In 1191, he returned to Japan and constructed a Zen temple in the Rinzai tradition. In spite of vigorous opposition from the Tendai sect, which was noted for its complex, ritually based tradition, he was able to establish monasteries in the cities of Kyoto and Kamakura. Indeed, unlike the slightly later rival Soto school of Zen, which spread through Japan's rural areas, Rinzai became firmly entrenched in Japan's cities.

Due to initial strong opposition to Zen, Eisai was forced to present his sect of Meditation Buddhism within a context that included Tendai and esoteric practices. To those who opposed its introduction, Eisai argued that Zen was not something new because it had been taught by the founder of the Tendai sect. To objections to his claim that Zen was true to the teachings of Buddhism, Eisai argued that Zen agreed with the spirit of Tendai and could contribute to its renewal. Ironically, Eisai called for a purified, independent Zen devoid of the all extraneous, esoteric, and ritualistic elements but, in seeming contradiction, taught a synthesis of Tendai thought, Tantric esotericism, and Zen.

Along with his younger contemporary, Dogen, Eisai was instrumental in promoting tea in Japan. When he returned from China, he brought seeds with him and began to cultivate tea gardens on temple grounds. He has also been credited with composing the first book advocating the health benefits of tea drinking. He praised it as a stimulant that was helpful for the practice of meditation and claimed that it had healing properties.

Nat Worship and the Ari Religion of Burma

Although Theravada Buddhism became the royal religion of Pagan in the eleventh century, it is wrong to think of it as an exclusive faith. Existing alongside it were forms of Mahayana and Tantric Buddhism, various Hindu sects, and two

religious expressions known as *nat* worship and the Ari cult.

Nat worship, presumably part of the original animist religion of the Burmese people, was a belief in nature spirits who need to be propitiated by offerings to ensure success and to avoid the calamities that followed when they were offended.

Once the Burmese had accepted Theravada Buddhism in the eleventh century, they incorporated belief in *nats* into Buddhist doctrine by equating them with the *devas* (gods) who inhabit Heaven, the highest of the six worlds of existence. Indeed, since in the wheel of existence humans may be reborn as gods, this opened up the possibility of transforming people in Burmese legends who were martyred or especially saintly into *nats*.

Moreover, despite the overlay of Theravada Buddhism, worship of *nats* as nature spirits never died out in Burma, especially in the countryside where even today every village has a shrine housing its protective spirit; every house, in fact, has its own guardian *nat* to whom offerings are made in order to guarantee protection from intruders, disease, or other misfortunes, and there are frequently *nat* figures along the wayside where the traveler may pray for safety on a journey. And there are *nat* figures even in the Buddhist temples, where they have been incorporated not so much perhaps as members of the Buddhist pantheon but as fellow worshipers paying homage to the Buddha.

The same is not true for the mysterious Ari religion whose connections to Buddhism are murky at best and that had no demonstrable connections to *nat* worship. The Ari, priests of a cult that held sway in Upper Burma until the late eleventh century, have been described as bearded, with hair four fingers long, and dressed in blue-black robes; they are also said to have drunk liquor, boxed, rode horses, gone into battle, and exercised the right of deflowering a bride on her wedding night, the sacrifice of her maidenhood to the officiating priest being considered an offering to their god or gods. It has also been claimed that the religion was centered on the worship of a Naga (a supernatural serpent that is often portrayed with a human face and upper body but with snakelike lower extremities)

Mount Popa, spiritual home of Burma's most important Nats, and a pilgrimage site for their worship. (Bill Snelson)

and that the religion also featured the Buddha with *shakti* (the female counterpart of his male cosmic force) wives, just as Hindu deities, such as Shiva, had their *shakti* consorts. Furthermore, it has been maintained that they had books of magic and a Mahayana Buddhist canon in Sanskrit and that the sect was in fact a debased form of Mahayana Buddhism. But none of this has been substantiated.

According to ancient Burmese chronicles, many generations before Anawrahta (r. 1044–1077), the first king of the Pagan dynasty and the person who instituted Theravada Buddhism as the royally patronized religion, the kings of that country believed in the “false doctrines and teachings” of the 30 Ari lords. These lords resided at Thamahti, a town a few miles southeast of Pagan, and reportedly had 60,000 disciples. It is stated also that they rejected the teachings of the Buddha, that each monk preached to his followers according to his own beliefs, and that at least some wrote books setting forth these beliefs. If a person took the life of another, even his own father or mother, so long as he recited the prayer for deliverance he would be absolved. The remark that the Ari renounced Buddhist doctrine has generally been interpreted as meaning that their belief was a deviant or perverted form of Buddhism, but taken at face value it might mean they were not Buddhists of any sort.

An alternative theory has proposed that this sect's name derives from the Sanskrit *aranyavasi*,

THE CUCUMBER KING

According to the Burmese chronicles, Nyaung-u Sawrahan (r. 931–964), known as the Cucumber King because he was formerly a farmer who owned a cucumber plantation, after mistakenly killing the former king, was asked to take that king's place on the throne. As king, Sawrahan decided to construct a pleasure garden, and in the middle of this garden he erected a large image of a Naga. He also consulted Ari priests regarding the form of the garden's pagodas. However, in no way does this imply that Sawrahan intended to establish the Ari cult as the royal religion. Yet when he finished building his private temples, he set up in them neither images of *nats* nor of the Buddha but instead set up figures of Nagas, which he worshiped in apparently private devotion.

—Roger Finch

designating monks living in the forest, and its priests were degenerate Theravada monks who rose to power from their jungle-based monasteries in the late twelfth century. However, the only deviant practices noted about these so-called degenerate Theravada monks is that they partook of meat and alcohol on the occasion of certain festivals, and these transgressions are negligible compared to those attributed to the powerful eleventh-century Ari priests of Upper Burma (whose name might just as well derive from the Sanskrit *ari*, meaning “hostile” or “enemy”).

Whatever their origins and practices, the last specific mention of the Ari dates from 1314, when Ari priests were counted among the army of Sawyun, grandson of Narathihapate, the last king of the Pagan dynasty. And yet their sect must have persisted at least for a while, for during the reign of Minhkaung (r. 1401–1422), chief of Ava (not far south of Mandalay), a group of monks known as Descendants of the Ari frequented the palace and there, indulging in perhaps the least of all the vices attributed to them, often drank too much and had to be carried back to their monastery on palanquins.

Buddhism and the Cult of Shiva—Side by Side in Java

During the half century and more immediately preceding the rise of Islam in Java, roughly 900–1500 CE, the ecclesiastical class was divided into two main groups, Shivaite (Brahmin priests of the cult of the Hindu deity Shiva) and Buddhist monks, and there are religious texts pertaining to both groups, though the number of Shivaite texts is greater than that of Buddhist ones.

The last attested material Buddhist monument to be found in Java is the portrait statue of Kritanagara (r. 1254–1292), the last ruler of the Kingdom of Singhasari, in the form of the Buddha Akshobya (the Eastern Buddha, one of five transcendental Buddhas), in Surabaya, on the north coast of eastern Java. This king is notable not only for his determination to extend the authority of Java over various neighboring countries but also for his devotion to the *kalachakra* (Wheel of Time) form of Tantric, or Esoteric, Buddhism that developed in the tenth century CE (about 965) in northern India, Kashmir, and Nepal. This form of Tantrism must have held a certain attraction for Kritanagara, either because of its incorporation of elements of Shivaism or because its emphasis on the redemption of the souls of the dead shared certain features in common with original Javanese ancestor worship. Whatever the case, the sect reached its culmination in Java at this time.

The Spread of Islam into Southeast Asia to 1500

During the thirteenth century, Islam emerged as an influence among the peoples of the islands and peninsular coastline of Southeast Asia. The original stimulus for this adoption is a matter of contention among historians, though most accept that Islam was brought to Southeast Asia through trade. This view is supported by local myths, which tell of a visit from either an Arabian or Indian holy man. Whoever they were, it seems that local rulers bestowed protection on such traders, waiting for the monsoon winds to continue on to China or to return westward, and their long-standing presence might ultimately have facilitated royal conversions to Islam. Evidence for this process can be seen in the reports of Marco Polo in 1292 and Ibn Battuta in 1345–1346, who both visited Sumatra in their travels.

It is probable, though, that the diffusion of Islam was more complex than the simple arrival of Muslim traders on Southeast Asian shores, for foreign Muslims are known to have passed through Southeast Asia well before the thirteenth century. Southeast Asians were themselves active traders in the Indian Ocean and northward to China, where Muslims had an established presence since the ninth century. For such reasons, A. H. Johns was the first to argue that Southeast Asian rulers became attracted to the religion in a world changed by the Mongol invasions, seeing Islam as making an inward turn and crediting Sufi mystics as the main transporters of Islam into Southeast Asia.

Whatever the mechanism was, the first surviving witness to a royal conversion in this region can be found on the tombstone of Sultan Sulayman bin Abdullah al-Basir, found in northern Sumatra and seemingly dated to 1211. A perhaps more reliable witness can be found in the headstone commemorating the death of another Sumatran ruler, Sultan Malik al-Salih of Samudra, in 1297. Across the long strait separating Sumatra from the Malay Peninsula, the kingdom of Malacca embraced Islam around 1400. It would

➤ SOME PROBLEMS WORKING WITH OLD JAVANESE TEXTS

The number of texts in Old Javanese, dating from the period beginning about 900 up to 1500 CE, is rather small. Compounding the problem facing historians who rely on this documentary evidence is the fact that few out of this severely limited body of texts provide reliable information as to when they were written. In many cases the date mentioned in the text refers to when the copy was made and not to when the original text was composed. Furthermore, in some cases it is open to question whether a given text was written in Java or in Bali, because during this period the same literary language was in use in both places. On the basis of the nature of the language of the texts and the form of the letters used to write the text, however, it is possible to distinguish between authors living during the period of the Kadiri kings (up until about 1200 CE) and their predecessors, on the one hand, and those written in the subsequent Singhasari-Maja-pahit period, on the other.

—Roger Finch

come to control a majority of the trade that occurred between India and China and act as a major base from which further conversions within the archipelago would occur.

Islam moved easily along trade routes because the Malay language, already a popular commercial language, served as a medium for preaching the faith. By and large, early Southeast Asian conversion to Islam was not the result of conquest by Muslim armies from abroad, nor was it identified with the wholesale acceptance of Arab culture. At first, Islamization probably followed simple outward forms for the majority of Southeast Asian populations, as rulers such as Malik al-Salih took Muslim names and began to forsake pork and practice circumcision and Muslim funerary rites. In time, many Muslims sought instruction in the texts of Islam as compiled and disseminated by their religious scholars, the ulama, thereby becoming more fully integrated into the worldwide family of Islam. Nevertheless, their particular form of Islam was long noted for its strong indigenous identity. Practices such as

➤ MARCO POLO'S ACCOUNT OF SUMATRA

Around the year 1292, Marco Polo (along with his father and uncle) departed from the court of Khubilai Khan and traveled by sea to Khorasan (a region comprised of portions of present-day Iran, Turkmenistan, and Afghanistan). Along the way, they visited the Malay islands, Vietnam, and Sumatra, where Polo made the following observations about the spread of Islam in that area:

“You must know that the people of Ferlec [Perlak in northern Sumatra] used all to be idolaters, but owing to contact with Saracen merchants, who continually resort here in their ships, they have all been converted to the law of Mahomet. This applies only to the inhabitants of the city. The people of the mountains live like beasts. For I assure you that they eat human flesh and every other sort of flesh, clean or unclean. They worship many different things; for whatever they see first when they wake in the morning, that they worship.”

—Alfred J. Andrea

The Cumans

The Cumans, a Turkic people who migrated westward out of East Asia, are known in Russian historical sources as Polovtsy and in Arabic sources

as Kipchak, although the Arabic author al-Marwazi (writing circa 1120) called them Qun, which corresponds to the Hungarian name Kún for the Cumans. The Kipchaks have been identified as the remainder of the Turkut (or Turk) empire, which was located in what is the present-day Mongolian Republic and collapsed in 740. Some historians, to the contrary, maintain that the Kipchak and the Cumans were two distinct tribes. In any case, the Cumans were the westernmost group of this loosely associated tribal confederation, which in time came to extend from areas along the Danube River in Europe eastward to an ill-defined area in the Kazakh steppe and western Siberia. The Pechenegs, who preceded the Cumans in the general westward migration of these various Turkic tribes, eventually settled in the steppes of southern Russia, but they were swept aside by the Cumans, who subjected neighboring Slavic principalities to constant raids and attacks.

Of particular interest is the attitude of these various Turkic tribes toward religion. As they moved gradually westward and came in contact with the sedentary populations of Eastern Europe and the Middle East, they appear to have converted rather easily from their original animistic-shamanistic beliefs to the various religions of their new neighbors, probably more in an effort to assimilate Western culture than due to any strong religious convictions. The most notable example of this is perhaps that of the Khazars. In spite of welcoming the Christian missionary Constantine (or Cyril), sent by the emperor in Constantinople in 851 to convert them, the khan together with his court adopted Judaism as their religion, although there is no evidence that Judaism became the official religion of the Khazar state. And not long afterward, around 965, they renounced this faith in favor of Islam. Indeed, the majority of the Turkic tribes that migrated westward adopted Islam as they settled near neighboring Islamic countries to the south, but the Cumans became Christian.

As the Cumans moved across the steppe they settled in five areas: the western Central Asian region of present-day Kazakhstan, the Volga area, the Don River region, the Dnieper River region, and the Danubian River region. Early Cuman settlements in Hungary date from probably around

► THE *CODEX CUMANICUS*

The *Codex Cumanicus* (*Cuman Codex*, a codex being a bound manuscript), preserved at the Biblioteca Marciana (the Library of San Marco) in Venice, was written as part of an attempt to convert the Cuman Turks to Latin Christianity. It consists of two parts, the first a grammar and glossaries (word lists) of the Cuman language, written toward the end of the thirteenth century by an Italian colonist, possibly in Crimea; copied in 1303 at the monastery of St. John, probably at Saray, on the Volga River; and then recopied between 1330 and 1344. About ten years later some Franciscan friars from Germany added glosses in German to the lists of words in the first part; the second part is primarily a translation of Christian texts in prose and in verse. This manuscript was acquired later by certain Italian merchants who were residing in the area north of the Black Sea, and eventually it made its way to Venice. There is a legend that the manuscript at one point belonged to the famous Italian poet Petrarch (1304–1374), but there is no foundation for this story in fact.

The manuscript contains 82 folios (pages), written on both sides. The first part consists of 55 folios, and the second part consists of 27 folios. The first part begins with the conjugation of the Latin verb *audio* (to hear) in Latin followed by the corresponding forms in Persian and Cuman Turkish and then a list of Latin verbs together with nouns derived from the same verbs (for example, *auditus* “hearing; sense of hearing” from *audio*) in alphabetic order, a list of adverbs, a table showing

the declension of nouns and pronouns, and finally a list of nouns grouped according to category, such as terms pertaining to religion, colors, parts of the body, vegetables, and mammals. The second part begins with several pages listing words in Cuman with German glosses, and this is followed by texts; these include not only prayers, sermons, and religious hymns (some with music notation) but also riddles, additional notes on the Cuman language, and short lists of other words occurring in the preceding prayers and hymns.

Apparently the Cuman-language prayers and other ritual texts of the second part were widely disseminated. In the account of his travels between 1396 and 1427, the Bavarian Johann Schiltberger stated that he was taken prisoner in the Battle of Nicopolis against the Ottoman Turks by the eldest son of Sultan Suleiman and was appointed page to the sultan, and he gives an example of the Tatar-language *Pater Noster* (*Lord's Prayer*) that he collected at some place he visited. In the battle of the Ottoman Turks against Amir Timur (Tamerlane) in Ankara in 1402, Schiltberger was again captured, and it was in the service of Timur that he traveled throughout “Tatary,” where he collected this example of the *Pater Noster*. The prayer as he heard it and later wrote it down is much the same as that in the *Codex Cumanicus*, the main difference being that in the Tatar version certain originally Turkic words have been replaced by Arabic words.

—Roger Finch

1070. The Cumans in time became masters of the entire southern Russian steppe zone. This empire collapsed suddenly, however, when in the winter of 1238–1239 the Cumans were attacked and defeated by the Mongols of Batu Khan. Following this disaster, part of the Cuman population, under Kuten Khan, fled to Hungary, where the earlier Danubian Cuman groups had settled, and Kuten sought refuge for himself and his people from the king of Hungary, offering to convert to Latin Christianity, a proposition that was received eagerly by King Andras. Early in the thirteenth century Hungary, with encouragement from the pope, had become very interested

in Cuman affairs. Already the diocese of Milkovia had been created in Moldavia, a region in present-day Romania bordering on the Black Sea, the jurisdiction of which extended to the land where the Cumans had been living, and the archbishop of Esztergom was named papal legate in Cumania to follow up on earlier successes of Dominican friars in converting the Cumans to the east of Hungary.

The second conversion of Cuman people occurred during the following century in the land from which this refugee group under Kuten Khan had fled. As a result of Italian commercial expansion on the north shore of the Black Sea during

the fourteenth century and the evangelizing activities of Franciscan friars, at least a portion of the population was converted to Latin Christianity. It even appears that these missionary activities were encouraged by Ozbek, the khan of the Golden Horde, in spite of the fact that he had been converted to Islam, and in 1338 he made a gift of land in this area as a site for a monastery.

Christendom beyond the West

Christendom in the Middle East, Africa, and Asia during the period 1000–1500 was transformed by disease, war, persecution, religious competition, foreign invasions, isolation, and political, cultural, and religious change. Christian churches were scattered over vast geographic distances and relied on trade routes to connect with one another. The churches of non-Western Christendom, more often than not subject to non-Christian polities, were also reliant upon religious tolerance and political favor to thrive during this 500-year period. Consequently, as empires rose and fell in Afro-Eurasia, Christianity was transformed from primarily a non-Western religion to a religion that would remain dominant only in the West and in kingdoms such as Ethiopia, where it was linked to political power.

Through their travels along the Silk Road and other Eurasian trade routes, Christian missionar-

ies and laity helped unite churches and monasteries from Mesopotamia across Central Asia to Mongolia and China. Migrations of Christians from one region to another also allowed ecclesiastical leaders (a patriarch or archbishop) to maintain ties with cities, churches, and monasteries that were often thousands of miles away from the center of ecclesiastical power. For example, the Syrian Orthodox Church held influence over churches in geographic regions as diverse as Egypt, Persia, and India, while the Armenian Church, the Church of the East (mistakenly referred to as the “Nestorian Church” in the West and today known as the Holy Apostolic Catholic Assyrian Church of the East), the Georgian Church, and others claimed authority over churches scattered across Afro-Eurasia. Many of the divisions that distinguished the various churches from each other centered on disputes or misunderstandings about Christian doctrine, ecclesiastical leadership, or socioreligious identity.

Political power also played a key role in the life of Churches. Since political rulers usually determined religious practice in regions under their control, Christians attempted to gain the favor of rulers. The close association of political power with indigenous Christians did not necessarily equate to the long-term survival of a particular church in a kingdom or region, even though it may have been beneficial for a significant period of time. Persecution usually accompanied new political dynasties when churches were closely identified with the previous now-discredited regimes. Consequently, by the end of the fifteenth century non-Western Christendom was in severe decline due to changes in Afro-Eurasian politics.

Christendom in the Middle East, Asia, and Africa experienced a pendulum-like swing from expansion to contraction during this period. For example, Assyrian, or Church of the East, missionaries operating along the Silk Road are credited with converting Kerait, Naiman, Ongut, and other Turco-Mongol tribes of Central Asia in the eleventh and twelfth centuries, which would eventually lead to the reintroduction of Christianity in China in the thirteenth century. After the establishment of the Mongol Yuan dynasty (1271–1368), its capital city of Khanbaliq (present-day Beijing) and several other Chinese cities would have Latin Christian archbishops, churches, and

➤ BARHEBRAEUS

Barhebraeus (1225/1226–1286), known in Arabic as Gregory abul Faraj ibn al Ibri, served as the *maphrian* (archbishop) of the Eastern Syrian Orthodox Church from 1264 until his death in 1286. Tradition claims that he was the son of a prominent physician of Jewish descent. In his youth, during a period of Mongol expansion, his family moved from its home in Malatya in Anatolia to the still largely Greek Orthodox city of Antioch in northern Syria. Educated there by Christian teachers who held conflicting theological viewpoints, Barhebraeus learned to appreciate differences among the various Christian Churches represented in the Middle East but also saw the need for Christian unity. While in Antioch, he also made the decision to pursue a life of service to the Church by becoming a monk.

His time as a simple monk was short-lived, and he was installed in his first bishopric at Gubos around the age of 20. He was later promoted to the bishopric of Aleppoin in southern Syria. In 1264 he was made maphrian, also referred to as a *catholicos*, of the Eastern Syrian Orthodox Church.

Faced with challenging political and social circumstances, he worked tirelessly to revitalize the churches under his leadership that suffered from fragmentation and alienation due to war and persecution. He made pastoral visits to these churches, reorganized the leadership of the Church, and even worked to win the favor of Mongol il-khans of Persia for the Church. Besides revitalizing the churches under his authority, he attempted to bring unity among the Christians living in the Middle East and managed to earn the respect and admiration of those in the Armenian Church, the Greek Orthodox Church, and the Church of the East.

Barhebraeus was also a prolific scholar who wrote on topics including Christian theology, canon law, spirituality, logic, astronomy, ethics, medicine, philosophy, and grammar. His most significant book, *Chronicle*, is a historical work that tells the story of the Christian Church and the development of civilization.

—Darin D. Lenz

monasteries. Christianity in China thrived until the collapse of the Yuan dynasty, when the religion became detested as a foreign religion imposed by foreign rulers. The Middle East, in contrast to China, saw a different sequence of events that also resulted in the deterioration of the Christian presence there. The slow decline of the Greek Orthodox Byzantine empire, which began in the eleventh century with the rise of the Seljuk Turks from Central Asia, sparked the crusades as the Latin West's response to this crisis in Christendom. Ironically, this period of warfare destabilized the Church of the East, the Greek Orthodox Church, the Syrian Orthodox Church (mistakenly called "Jacobite"), the Maronite Church, and other churches. Although persecution of Eastern Christians by Latin Christians and Muslims alike did occur during the crusades, the real challenge to non-Western Christendom began with the thirteenth-century Mongol invasions and, later, militant Muslim rule in the Middle East and Central Asia. The process of expansion and contraction was therefore not uni-

form, and the remnants of once politically connected churches often survived as minority religious communities in regions where other religions dominated culturally and politically.

The primary challenge to Afro-Eurasian Christendom through the end of the fifteenth century was the continued movement of Islam far beyond the Arabian Peninsula, a phenomenon that began in the seventh century. Even the devastating Mongol invasions from Central Asia that began in the thirteenth century did not do as much damage to non-Western Christendom as the continued expansion of Islam. This was partly due to the fact that the Mongols embraced religious toleration based on a tradition that did not show favoritism to one religion over another, even though the Mongol khans had mothers, wives, soldiers, and generals who professed Christianity. The Mongols proved that they were indifferent to Christians by conquering Christian kingdoms, such as Russia and Georgia, or forcing them to become vassal states. Yet religious and diplomatic envoys traveled across Asia from the courts of

both Mongol rulers and European rulers with the aim of creating an alliance to destroy Islamic civilization, which both viewed as a chief threat to their own power. One envoy sent from Rome, the Franciscan John of Montecorvino (1247–1328), convinced the Ongut ruler and vassal prince of the Yuan dynasty, King George, to convert from the Church of the East to Roman Catholicism at the end of the thirteenth century. King George was falsely linked to the lineage of the mythical Prester John by Marco Polo, and his conversion was triumphed throughout Europe. King George's conversion marked the high point of medieval Roman Catholic missionary work in China that ended sometime around the second half of the fourteenth century, when the Black Death ravaged China and the Yuan dynasty collapsed under the resulting chaos. Without the support of the Yuan dynasty, Christianity was seen as a foreign religion and rapidly disappeared from China. Similar to Mongol rule in China, Christianity in Mongol (or Il-khanate) Persia was able to reach its height of influence. However, the political situation changed when the Mongol ruler Il-khan Ghazan (r. 1295–1304) became a Muslim and sanctioned the persecution of Christians in Mesopotamia, Iran, and adjoining lands. Likewise, the already-battered Christian Churches in Mesopotamia, Persia Anatolia, and Central Asia would also struggle to survive the successive persecutions launched by various other Muslim rulers, such as Tamerlane. For example, under the rule of the Ottoman Turks, churches in Anatolia, the Caucasus, and the Balkans were undermined by the periodic conscription and forced conversion of Christian youths to Islam in order to serve as janissaries in the Ottoman army. Likewise, in Persia and Mesopotamia at the start of the sixteenth century (and the dawn of the Safavid empire), Christians who survived the series of invasions over previous centuries now faced persecution from Shia Muslims. India alone presents the single exception to the decline of Christendom in Asia during this period. The St. Thomas Christians, who claimed their origins from the Apostle Thomas in the first century, were located along the Malabar Coast in southwestern India and held status as a distinct caste in Hindu society. They were influenced by monks and lay Christians who immigrated to the region

from the Middle East. The Indian Church during this period remained vibrant, although it was almost completely isolated from violent events that altered Christendom in the rest of Asia.

African Christianity, like Eurasian Christianity, was also transformed by the expansion of Islam during this era. In Egypt in 996, the Fatamid caliph al-Hakim came to power and initiated a period of severe persecution targeting the Egyptian Church, which claims a lineage dating back to the Apostle Mark. The Coptic Church, as Egyptian Christians are referred to, saw thousands of churches and monasteries destroyed or converted into mosques, while untold numbers converted to Islam in order to avoid persecution. Periods of persecution were, however, sporadic. Under the Ayyubid dynasty (1171–1250) the Copts participated in civil government, while the Mamluk sultans (1250–1517) launched a new era of persecution that took aim at all churches in Egypt, including the Copts, the Armenian Church, and the Syrian Orthodox Church. Persecution, religious competition, and changing political circumstances all led to the decline of Christianity in Egypt as Islam continued to grow among the population. Even disease would play a role in undermining Egyptian Christianity, as it did in Eurasia, when the Black Death arrived in the fourteenth century and devastated churches and especially monasteries.

South of Egypt along the Nile River, the Nubian Church, in present-day Sudan, also embraced the influence of the Coptic Church and benefited from a monarchy that promoted and protected Christianity. It was unable, however, to resist the expansion of Islam, and ultimately it faltered and collapsed as Islam subjugated North Africa. The last Christian king of Nubia was defeated in 1323 by a Mamluk army, and by 1500 remnants of Christendom seem to have entirely disappeared from Nubia.

Nubia's neighbor to the south, Ethiopia, was also threatened by the migration of Muslims into the interior of Africa. However, beginning in the thirteenth century during a period referred to as the Solomonic Revival, the Ethiopian Orthodox Church, which was also connected to the Coptic Church, strengthened an already existing four-part relationship that connected Ethiopia's Semitic heritage, Judaism, Christianity, and the

monarchy. It did so by claiming that it possessed the Ark of the Covenant; that its consecrated kings were saintly, direct descendants of King Solomon of ancient Israel; and that Ethiopia was the New Zion. Consequently, Ethiopia alone managed to emerge from this 500-year period with a renewed sense of Christian identity that tied the history of its kingdom to sacred history.

The Widening Divide—Orthodox Constantinople and Catholic Rome, 1000–1453

During the era circa 1000–1500, members of the Byzantine (or Greek) Orthodox Church of Constantinople and the Latin Catholic Church

Early-thirteenth-century mosaic depicts the surrender of Constantinople in 1204 during the Fourth Crusade. (Adrian Fletcher)

of Rome formally recognized that they were in a state of ecclesiastical schism. Despite their historical differences in doctrine, rites, and customs, there is no evidence that Greeks and Latins before this period believed there to be an irremediable divergence between their two communities. Events during the eleventh through the fifteenth centuries, including the papal reform movement in the Roman Church, the crusades, and the Ottoman conquest of the Byzantine empire, all contributed to the divide between these two branches of Christianity.

Before the eleventh century, Rome and Constantinople had experienced a number of misunderstandings and crises over the question of papal primacy. Based on their belief that the first bishop of Rome was Saint Peter, “the prince of the Apostles,” whom Christ had singled out as the “rock” (*petros* in Greek) upon which his Church would be built (Matthew 16:13–19), the later bishops of Rome claimed to have inherited Peter’s authority. Therefore, they possessed ultimate jurisdiction over all other Christian bishops, including the patriarch of imperial Constantinople. Although the Church of Constantinople accorded the bishop of Rome the honor of being

► THE APOCALYPTIC REUNION OF THE LATIN AND GREEK CHURCHES

The twelfth and thirteenth centuries were a period of creativity in Latin Christian thought about the meaning of history, including a belief that the division of Christendom into its Latin and Greek (Byzantine) halves was a divinely ordained event. This view of the past was accompanied by predictions that the two churches would be reunited before the end of time. According to the apocalyptic thinker Joachim of Fiore (d. 1202), the schism between the Latins and Greeks was an inevitable part of God's plan for history, just like the biblical division between the two tribes of the kingdom of Judah and the ten tribes of the kingdom of Israel (1 Kings 12–13). Due to the Greek rejection of Roman doctrine and authority, the Eastern empire had suffered a divinely ordained punishment through the loss of its territories to the Muslims centuries beforehand. Joachim also believed, however, that a special order of monks from the Latin Church would lead the Greeks back to the true community of the faithful during a future age of spiritual transformation. As Joachim wrote in his *Book on the Concordance of the Old and New Testament*:

“After the Babylonian transmigration [a future period of tribulation for the Church], there will not be lacking a remnant of the faithful among the Latins, in which the Holy Spirit will carry out its work up until the consummation of the ages. Through them not only the Greeks, who seem nearer to grace, but also the Jews, who wander farther from it, shall be led back to the unity of the faith.”

Joachim's vision of an apocalyptic reunion between the Latin and Greek churches under the leadership of the Roman Church was highly influential. After the Fourth Crusade seized Constantinople in 1204, Pope Innocent III (d. 1216) quoted Joachim in two of his letters addressed to the Latin clergy in the captured city and expressed his own belief that the fall of Constantinople would be followed by the reunion of the two churches, the conversion of the Jews, and the spread of Christianity throughout the world before the end of time. Predictions about the future reunification of the two Christian peoples persisted over the following decades, especially among members of the Franciscan order who were attracted to Joachim's apocalyptic thought. Shortly after the Second Council of Lyons in 1274, Franciscan monk and chronicler Salimbene of Parma (d. 1287) declared that the union between the churches achieved at the council represented a fulfillment of Joachim's prophecies. Although the results of Second Lyon were short-lived, prophecies about the future restoration of Christian unity continued to be popular well into the fourteenth century and beyond.

Abbot Joachim of Fiore: Liber de concordia novi et veteris testamenti, Vol. 73, edited by E. R. Daniel and translated by Brett E. Whalen, 137, Transactions of the American Philosophy Society (Philadelphia: American Philosophical Society, 1983).

first among equals, it did not recognize the papacy's more sweeping claims.

Developments in the eleventh-century Roman Church pushed this source of periodic conflict to the foreground. Starting with Pope Leo IX (r. 1049–1054), the papacy and its supporters sought a clearer separation between clergy and laity, including the sacred authority of popes and the secular power of emperors. As part of this program to reform the Church, the papacy insisted more strongly than ever that all Christians owed their obedience to Rome. At the same time, popes and reformers demanded a greater

level of conformity to Roman teachings and religious practices.

This innovative emphasis on Roman primacy was not well received by the emperors and patriarchs of Constantinople. One famous example of increased tension between the two churches occurred at Constantinople in 1054. Among numerous issues, representatives of the Latin and Byzantine Churches argued over papal authority and over which kind of bread was appropriate for the Christian sacrifice of the Eucharist: unleavened bread (the Latin practice) or leavened bread (as used by the Byzantines). In the midst

of this wrangling, several long-standing differences between the two churches were newly exposed and magnified, including the Filioque Controversy. According to Greek doctrine, God the Holy Spirit proceeds from the Father alone, while Latin theologians taught that the Holy Spirit proceeds from the Father “and from the Son” (in Latin, *filioque*). The seriousness of these disagreements became evident when papal legates and the Greek patriarch mutually excommunicated each other.

Despite lingering modern notions to the contrary, this crisis did not result in a lasting rupture between Rome and Constantinople. Toward the end of the eleventh century, the Byzantine emperor Alexius I Comnenus (r. 1081–1118) and Pope Urban II (r. 1088–1099) both expressed their desire to bring the churches closer together. Urban came to envision an armed campaign of Latin warriors that would free Constantinople from the threat of Islamic conquest, liberate Eastern Christians from Muslim domination, and recapture Jerusalem for all Christian believers. This expedition became known as the First Crusade. The crusade, which captured Jerusalem on July 15, 1099, did not bring about meaningful improvement between Latins and Greeks (as Westerners called the Byzantines). Sporadic violence between crusaders and Byzantine forces during the march to Jerusalem, the widespread belief that Emperor Alexius had betrayed the crusade, and the subsequent establishment of a Latin Church in Palestine that disenfranchised Greeks and other Eastern Christians equally served as sources of tension between Rome and Constantinople.

Crusading activity during the twelfth century fueled additional conflicts. During the Second Crusade (1147–1149), some crusaders advocated an open assault on Constantinople. This growing gap between the two churches, however, was not uncontested. During the Second Crusade, for example, other crusaders insisted that an attack on fellow Christians would be illicit and would violate their crusading vow. Throughout the twelfth century, clergy on both sides continued to seek common ground between the sibling faiths, Western mercenaries continued to serve in Byzantine armies, and aristocrats from both churches continued to marry.

In light of such continuing connections between Latins and Greeks, the three-day sack of Constantinople by the army of the Fourth Crusade that began on April 13, 1204, should not be seen as the inevitable outcome of growing Latin animosity for the Greek Church. The crusader conquest of the city was the combination of unique historical circumstances, although most Latin churchmen, including Pope Innocent III (r. 1198–1216), interpreted the capture of Constantinople as a rightful act directed by a just but merciful God. It was both a means of momentarily punishing the Greeks for their rejection of Roman authority and teachings and, more importantly, of returning the Church of Constantinople to the guidance of its “mother,” Rome. In fact, however, the devastating seizure of the city, accompanied by a series of fires and the plunder of its ecclesiastical treasures, resulted in a heightened state of animosity between Latin and Greek Christians. For nearly 60 years, until the Byzantine emperor-in-exile Michael VIII Palaeologus (r. 1259–1282) recaptured the imperial capital in 1261, Latins and Greeks shared an uneasy co-existence that was alternately punctuated by armed conflict and negotiations for the reunion of the churches.

At the Second Council of Lyons in 1274, Pope Gregory X (r. 1271–1276) and representatives of the Greek emperor reached a tentative agreement that resolved to Rome’s satisfaction their major disputes, including over papal primacy and *filioque*. The majority of the Greek clergy, however, repudiated this one-sided agreement, which completely dissolved under Pope Martin IV (r. 1281–1285) and the Byzantine ruler Andronicus II (r. 1282–1328).

During the fourteenth and early fifteenth centuries, the basic conditions of the schism between Rome and Constantinople did not change substantially. The papacy continued to insist on the recognition of its position as the ultimate arbiter in the Church and also required a meaningful level of Greek conformity to Roman doctrine and rites.

From the Greek perspective, a genuine resolution to the now undeniable schism could only come about by an ecumenical council that represented the collective and infallible authority of the Christian ecclesiastical hierarchy. Within this

framework, the possibility of reunion was raised at the Councils of Constance (1414–1417), Basel (1431–1449), and Ferrara-Florence (1438–1439). At Florence, tentative terms for another union were accepted by the Byzantine emperor John VIII (r. 1425–1448) and his patriarch but were repudiated by the vast majority of Greek clergy and laity. By this time, the official Byzantine policy of seeking an accommodation with Rome was driven by the expanding Ottoman conquests of Byzantine territories and Constantinople's need of Western Christian allies. In 1453 Turkish armies captured Constantinople, a turn of events that rendered any immediate negotiations between the Church of Rome and the now devastated Orthodox Church effectively impossible. The formal schism between the two Christian communities has continued into the twenty-first century, as have periodic efforts to end the division of Christendom.

Popular Piety and Heresy in Latin Christendom

Popular piety and heresy were two interwoven religious tendencies in the culture of the Latin West during the period 1000–1500. On the one hand, faithful believers strove to find the true meaning of Christian prophecy, either individually or through their communities, even if their efforts might intentionally or inadvertently defy

church authority. On the other hand, the papacy was determined to eliminate invasions of the work of the devil into popular perceptions and practices in order to defend the theological orthodoxy and good order of the Church.

Several factors contributed to the rise of popular piety. Parish churches and other religious institutions reached into almost every corner of the European countryside, bringing religious services to the mass peasantry. Beyond that, the growth of a vibrant commercial economy and the increase of Europe's urban population added a new dynamic element within the Christian laity, whose lifestyles and religious needs differed significantly from those of rural people. Moreover, women, aristocratic and common alike, became active participants in the Catholic faith and demanded that their voices be heard and their concerns addressed. Additionally, liberal arts education in schools and universities led to the introduction of logic and humanistic perspectives into the study of theology. The spread of lay literacy, due in large part to the adoption of Europe's vernacular languages in public discourses, also expanded the public spaces where new religious perceptions and ideas might be expressed. Overlying all of this was the Church's self-defined role of encouraging and rewarding acts of popular devotion to God and the saints and pious service to fellow Christians.

The cult of Mary, the Virgin Mother of Jesus, was the most widely embraced form of popular piety promoted by the Church. From the twelfth century onward, the Virgin Mary became not only the most popular saint for female believers but also the universal symbol of human perfectibility and the universal mediator between God and humans. Pilgrimages to holy sites and the veneration of canonized saints (deceased holy people whom the Church recognized as heavenly intercessors) constituted another aspect of officially sanctioned popular piety. A special form of pilgrimage, the crusade, became a widely embraced form of popular devotion sponsored by the Church, and from the crusade movement evolved the institution of indulgences, gifts of heavenly grace bestowed by the Church upon the faithful who performed pious acts.

However, from the very beginning of its formation in late antiquity, the Roman Church me-

Pope Innocent III excommunicating the Albigensians, from the Chroniques de France ou de Saint Denis, fourteenth century. (HIP/Art Resource, NY)

ticulously and passionately defended its integrity against heresy, which it perceived to be the work of the devil. From the eleventh century onward, some independent-minded priests and lay community leaders instigated the spread of novel ideas and religious practices that church leaders viewed as deviations from the Church's official teachings as based on the consensus of tradition, the decrees of ecumenical councils, and past papal decisions. The Church equally feared the radical defiance of intellectuals and the irrational, superstitious practices of the masses. Suspicious of subversion from below, the Church, often assisted by secular authorities, revived the pursuit of heresy, which had been absent from church politics for centuries.

In the twelfth century, this revived pursuit of heresy began to focus on regional movements of evangelical piety that often expressed discontent with the perceived wealth and worldliness of the established clergy by calling for a return to the presumed apostolic poverty of the Church of the martyrs (before the early-fourth-century reign of Emperor Constantine I). Often these movements were led by charismatic individuals and even by some intellectuals. Because they

claimed to seek a return to an older, presumably purer, and more authentic form of Christian faith and practice, the Church viewed these pietistic movements as especially disorderly, subversive, and dangerous. In 1184, Pope Lucius III banned a group of lay Christians known as the Waldensians for their unauthorized preaching. The Waldensians were a small group of largely urban laity in Lyon, France, who followed their leader, a shadowy person known as Waldes or Valdes (to which later tradition added the forename Peter), by giving up their property for a life of austerity and devoting their worldly goods and energy to preaching to and serving the poor. In response to the ban, the Waldensians formed a church of their own that adhered to much of Catholic orthodoxy but rejected purgatory (a place of purification for souls after death and before admission to Heaven) and indulgences and continued to appoint nonordained persons and even women to preach. The movement soon spread all over French Languedoc and northern Italy.

Alarmed by the failure to bring down the Waldensian heresy as well as other heterodox movements, Pope Innocent III began to contemplate and orchestrate a crusade against heresy during his pontificate (r. 1198–1216), which resulted in the Albigensian Crusade (1209–1229) and the subsequent Inquisition, which his kinsman and successor, Gregory IX (r. 1227–1241) inaugurated. Innocent, Gregory, and the rest of the popes of the thirteenth century were not religious fanatics. In campaigning against heresy, they drafted rational judicial procedures within the framework of canon law. In dealing with the evangelical poverty movement and heresy in general, they favored persuasion to persecution. For example, instead of condemning Francis of Assisi for his refusal to become an ordained priest, Pope Innocent III compromised by allowing him to accept the lesser order of deacon and blessed him for renouncing his wealth and inheritance, for preaching to the sick and the disenfranchised poor, and for making all men and women his siblings. With papal blessing, the Order of Friars Minor (Lesser Brothers), known popularly as the Franciscans, was founded on the basis of Jesus's statement "Leave all and follow me." In 1217, Pope Honorius III (r. 1216–1227) approved the Order of Preachers, commonly known as the Dominican

➤ GRIEVANCES AGAINST THE PAPACY

John Wycliffe (ca. 1330–1384), the Oxford scholar and spiritual leader of the English Lollards, summarized people's numerous complaints over the moral decay of the papacy:

"And it seems to them that the pope is Antichrist on earth, because he is the opposite of Christ in life and lore.

Christ was a very poor man from His birth to His death and forswore worldly riches . . . , in accord with the state of primal innocence, but Antichrist, in contrast to this, from the time he is made pope to the time of his death, covets worldly wealth and tries in many shrewd ways to gain riches. Christ was the most meek man and urged that we learn from Him, but people say that the pope is the proudest man on earth, he makes lords kiss his feet, whereas Christ washed His apostles' feet. Christ was a most unpretentious man in life, deeds, and words. People say that this pope is not like Christ in this way, for whereas Christ went on foot to cities and little towns alike, they say this pope desires to live in a castle in a grand manner."

Order, whose friars, like their counterparts the Franciscans, practiced a form of apostolic poverty similar to that of the Waldensians. The difference between the friars (and other orthodox movements, such as the Humiliati, that emphasized lives of poverty and humility) and the Waldensians (and Albigensians) is that the former accepted papal leadership, confirmed the authority of priests (and, in time, most Franciscans themselves became priests), and coordinated their preaching with official church doctrines. Furthermore, the Dominican friars joined the papacy in the crusade against the Albigensian heresy. The Franciscans were less enthusiastic about directly confronting heresy at the beginning of their movement but contributed to Europe's growing popular piety by stressing devotion to the life

and suffering of Jesus. Indeed, Francis was seen as the *alter Christus* (Second Christ), with no blasphemy intended or perceived, because of his life of self-sacrifice and uncompromising poverty and loving service. It was accepted as fact that Jesus himself imprinted on Francis's body the stigmata, the wounds of the crucifixion, as a token of Francis's Christlike life.

The crusade against the Cathars of Languedoc destroyed their political base but did not root out their faith. Indeed, heretical ideas were spreading over much of continental Western Europe, which forced Pope Gregory IX to establish the Inquisition Commissions in 1232. Thereafter, inquisitors, often Dominican or Franciscan friars or monks selected from established monastic orders noted for their detachment from the world and thus viewed as impartial to human affairs, were appointed by successive popes to carry out a series of judicial inquiries regarding heresy.
